put matters of high concern in their *eclogues*, and to have made their shepherds sing the praises of kings and heroes. Ronsard, in particular, has made himself ridiculous, by giving the *eclogues* of Budocus and Vatable in his first *eclogue*, from the shepherd Margot. Such persons should have been above the knowledge of the simple Margot. The sentiments in *eclogues*, the same authors observe, should be finer and more delicate than those of real shepherds; only their form should be as simple and rural as can be. But this simplicity excludes none besides glazing and excessive ornaments.

Since the establishment of the academy, or assembly of Academics at Rome, about the year 1690, the taste for *eclogues* has been greatly improved among the Italians. Those gentlemen, who are the flower of the wits of Italy, take the name of the shepherds of Arcadia, and will not allow their assembly to be treated as an academy. They have each of them a poetical name, which is always that of some shepherd; and apply themselves particularly to *eclogues*, as pieces most proper to their profession. See ACADEMY.

The word *eclogue* is formed from the Greek *eclogē*, choice. So that, according to the etymology of the word, *eclogues* should be no more than a select or choice piece; but custom has determined it to a farther signification, viz. a little elegant composition in a simple natural style and manner.

Idyllion and *eclogue*, in their primary intention, are the same thing: thus the *Idyllia*, *Idyllia*, of Theocritus, are pieces written perfectly in the same vein with the *Eclogues* of Virgil.

But custom has made a difference between them, and appropriated the name of *eclogue* to pieces wherein shepherds are introduced speaking; idyllion, to those written like the *eclogues*, in a simple natural style, but without any shepherds in them. Some imagine the name *eclogue* to have been originally attributed to such poems as were written in imitation of others; such as the *Eclogues* of Virgil, which are only imitations of Theocritus. Others are of opinion, the word was first formed from *ait, agros, greges, et domos discorsibus*, &c. a conversation or discourse of goats, or goatherds. But Ronsard, in his notes on Virgil, thinks they would then have made it *Agropagos, agropagos*, rather than *eclogues*; or, at least, the word would have been written in Greek with *ai*, and in Latin by *ai*, not *e*.

Barthius advances another opinion; viz. that the name *eclogue* was given to all poetical compositions that were of a moderate length, though too short to give them the name of books; and that hence it is that Statius, in the epistle at the head of the third book of his *Sylve*, and in the preface to his fourth book call his poems *Eclogues*, though he had not called them so in the title.

Aufonius, in the preface to his *Cupid crucified*, calls also his idylls *eclogues*. Add, that Cruquius, in his comment on Horace, declares that he had seen very ancient manuscripts, wherein the satires of the poet are called *eclogues*; in which he is seconded by our learned countryman, Mr. Baxter.

ECLOGUE is also applied to certain compositions in prose. Thus we read of the *eclogues* of Diodorus, of Polybius, of Ctesias, Theophrastus, Strabo, &c. In which sense the word only signifies *extract* or *collection*.

ECLYSIS, from *ecclis*, I faint, a word used by the ancient physicians, for a general faintness and feebleness of all parts of the body. Hippocrates uses it for a loss of voice, with a general decay of strength, and, in some other places, for a great weakening of the body, by violent discharges by stool.

ECMARTYRIA, *Ecmarptia*, in Antiquity, a kind of second-hand evidence, admitted in the Athenian courts. It was not founded on the knowledge of the witness himself, but on that of another person, who had been an eye-witness of the fact in question, but was at this time either dead, or in a foreign country, or detained by sickness; for, except in such cases, the allegations of absent persons were never taken for lawful evidence. Post. Archæol. Græc. lib. i. cap. 21. tom. i. p. 117.

ECNEPHIAS, from *ix* and *nepos*, a cloud, a word used by Galen, to express a peculiar sort of fever, which he says, was at once hot and humid, and which he therefore resembles, by the name, to the sun breaking out from a watery cloud.

ECOUË, in the *Manège*, is used for a pace, or motion of a horse, when he rides well upon the hand and the heels, is compactly put upon his haunches, and hears, or listens, to the heels or spurs; and continues duly balanced between the heels, without throwing to either side. This happens when a horse has a fine sense of the aids of the hand and heel.

ECPHONESIS, *Ecphosis*, in Rhetoric, the same with EX-CLAMATION.

ECPHORA, from *ec*, out, and *phos*, I bear, *Propheta*, in Arabic.

Architecture, usually denotes the line, or distance, between the extremity of a member, or moulding, and the neck of the column, or other part it projects from.

Some authors, however, account the *ephebra*, or projection, from the axis of the column; and define it to be the right line intercepted between the axis and the outermost surface of a member or moulding. See *PROJECTION*.

ECUPHRACTICS, *Ecuphactica*, in *Medicine*, such remedies as have a faculty of opening and untwisting the vessels through which the humours are to pass; or which incise and attenuate rough viscid humours, and thereby promote their discharge. They are the same with *apertants* and *dissolvents*.

The word is formed from the Greek *εκυφρακτις*, *is free from effusions*; of *εκ* and *φρακτις*, *defence, free*.

The chief simple *ecuphactica* are the little centaur, wormwood, agimony, hyssop, chamædrys, bark of tamarisk, roots of capers, scolopendrium, &c.

ECUPHRAXIS, in *Medicine*, is taking away obstructions in any part. Blancard.

ECUPHYSESIS, from *εκ* and *φυσις*, *I breathe*, in *Medicine*, is a disease in which the patient breathes thick.

ECUPHYSIS, of *εκ* and *φω*, *I produce*, in *Anatomy*, is any process that coheres with, or adheres to a bone.

ECUPESMA, *Ecupesma*, from *εκ* and *εμψω*, *I press*, in *Chirurgia*, a kind of fracture of the skull, &c. wherein there are several splinters, that press and disorder the inner membranes. See *FRACTURE*.

ECUPESMUS, *Ecupesmus*, in the ancient writers of *Medicine*, a word used to express a disfigurement of the eye, which consists in a very great prominence of the entire globe of the eye, which is, as it were, thrust out of its socket, or orbit, by a great flux of humours, or an inflammation.

ECUPLEOMA, of *εκ* and *επιωμα*, *I fill*, in the writings of the *Ancient Physicians*, the name given to a kind of cushion of leather, stuffed with some firm substance, and fitted to the cavities of the arm-pits, used in reducing luxations of the humerus.

ECUPLEXIS, from *εκπλεωω*, *I am disturbed*, in the writings of the *Ancient Physicians*, a word used to express a transport of mind, proceeding from some sudden perturbation. Hippocrates and Galen use the word to signify a stupor, or insensibility, in which the patient lies without motion, without speaking, or stirring, and with his eyes open.

ECUPNEUMATOSIS, in *Medicine*, the same with *expiratio*.

ECUPNOE, from *εκ* and *πνοω*, *I breathe*, a word used by medical writers, to express that part of respiration, in which the breath is expelled out of the lungs.

ECUPROMA, from *εκπρωω*, *I fall out*, a word used by the ancient physicians, in three or four different senses. It is sometimes made to express a luxation, or dislocation of a bone. Sometimes it is used for the falling off of any corrupted part, sometimes for the exfoliation of the secundines after child-birth, and sometimes for a falling down of the womb, or a defect of the os uterum or the intestine into the scrotum.

ECTOSIS, in *Surgery*, the same with luxation.

ECTUCICA, from *εκταω*, *I suppurate*, in the *Materialia Medica*, are condensing medicines.

ECREGMA, from *εκρηγω*, *I break off*, properly the name of a part, piece, or segment of any thing; but Hippocrates has, in some places, used it as the name of an eruption.

ECRITHMUS, from *εκ* without, and *ριθμος*, number, in *Medicine*, an irregular pulse, which observes no method, nor number, incident to any age. Blancard.

ECSTASIS cutis, from *εκσταω*, *I extend*, an extension of the skin, a term used by the ancients, as the opposite to corrugatio, or wrinkling.

ECSTATICI, *Ecstatici*, from *εκσταω*, *I am entranced*, in *Antiquity*, a kind of diviners, who were called into trances or ecstasies, in which they lay like dead men, or asleep, deprived of all sense and motion; but, after some time, returning to themselves, gave strange relations of what they had seen and heard. Pott. *Archæol. Græc. lib. ii. cap. 12. item. l. p. 302.*

ECSTROPHUS, from *εκστροφω*, *I turn out*, a name given by the ancient writers in medicine, to any thing that threw out the internal tumours of the plica, so that external remedies might be applied to them.

ECTHESIS, in *Chæmical History*, a name which the emperor Heraclius gave to a confession of faith published by him in 630.

The word is Greek, *εκτησις*, and signifies *expulsion*.

The *ecthesis* favoured the error of the Monothelites, and established only one will and one operation in Jesus Christ. Heraclius published it at the instigation of Adrianus, chief of the Jacobites, Cyrus patriarch of Alexandria, and Sergius patriarch of Constantinople; but the

Roman church esteemed it heretical, rejected it in a council held at Rome, A. D. 639, under the pontiff John IV. though Honorius, in spite of his infidelity, had approved it; and another edict was issued, suppressing the *ecthesis*, called the *type*, which soon after shared the same fate.

ECTHILIMA, from *εκθιω*, *I lose out*, an ulceration arising from a violent compression in the surface of the skin.

ECTHILIPSIS, in the *Latin Prose*, a figure whereby an *m* is retrenched, or cut off, chiefly at the end of a word, when the following word begins with a vowel, or an *h*.

The word is Greek, *εκθιλιψις*, which signifies *elision*.

Thus, in *mediam*, *est*, *terris*, *ictum*, &c. *Virg.* In forming the verse, we drop the *m* at the end of *mediam*, and only make three syllables in the two first words, *medi-ictu*.

Some account the *ecthesis* a poetical licence in the Latin versification; but, in reality, the elision of an *m* final, when the following word in the same verse begins with a vowel, is a matter of necessity, not of licence. Anciently, the *i* was likewise extended before a consonant; as *facunda*, *sequi*, *for*, *secundus*, &c. In reality, the *m* and *i* were peculiarly rough and harsh in the Latin pronunciation; as appears from Quintilian; and it was this that led the poets to retrench them at the ends of their words; as the like cause induced the French to drop their *e* feminine before a word beginning with a vowel, to avoid the hiatus, or concourse of vowels.

ECTHYMA, from *εκθω*, *I break out*, a name given by Hippocrates to any pustule, or cutaneous eruption.

ECTHYMOSIS, of *εκ*, *is*, and *θυμω*, *animus*, *mind*, in *Medicine*, a vehement agitation and dilatation of the blood and spirits; such as happens in extraordinary emotions of joy.

ECTOMIAS, from *εκτομω*, *I cut off*, a name used by the ancient physicians, to express a castrated animal.

ECTRIMMA, from *εκτριω*, *I rub off*, excoriation or galling. Hippocrates has used the word particularly to express excoriations of the skin about the os sacrum, contracted by lying long in one posture, in cases of fractures of the thigh, or in lingering illnesses, in which the patient is confined to his bed for a long time.

ECTROMIUM, from *εκτριω*, *I rub off*, in *Surgery*, that disfigurement of the eye-lid, in which they are covered or retracted, so as to show the internal or red surface, and cannot sufficiently cover the eye. Sometimes this is a simple and original disorder, and sometimes it is only a symptom of some other, as of an inflammation, scrofula, tumor, or the like. This sometimes owes its original to the contraction of the skin of the eye-lid, by the fear of a wound, ulcer, burn, &c. or to the insolation and contraction of the skin, after an inflammation, and sometimes it in a great measure proceeds from the injudicious use of astringent collyriums, or eye-waters.

When this disorder is become inveterate, it is not easily cured; while recent, it is to be attempted by relaxing and elongating the skin of the eye-lid, by the application of emollients, such as the vapors of hot milk, or water, oil of almonds, mucilage of quince-seed, and ointment of marshmallows. These must be repeated every day, the skin of the eye-lid drawn frequently towards its right position, and when the patient goes to bed, the eye-lids should be brought together, and restrained in their proper posture by a plaster, compress and bandage. But if all this fail, and the case yet appear not incurable, manual operation must take place.

The operation is performed in the following manner: first a semicircular incision is to be made in the external skin of the eye-lid, next its tarsus, or cartilaginous margin, making the angles of the incision, downward in the upper lid, and upward in the lower, that by this means the skin may be elongated. If it does not appear sufficiently let out by one incision, two or three more may be made, running parallel with the first, and at the distance of a small parchment. When the eye-lid is thus sufficiently elongated, the incisions must be dressed first with dry lint stuffed into them, and afterwards with lint, armed with some vulnerary unguent, which will prevent the skin from growing together again, and will occasion new flesh to be formed in the place, which will elongate the skin. Lastly, to forward the extension and cure, a piece of sticking plaster should be adhered to the eye-lid, to keep it extended, and this must be continued till the eye will shut close. When this case has continued from the patient's birth, the cure is very difficult, and it is a yet more hopeless case, when it happens to old people, from a weakness of the orbicular muscle. Heister's *Surgery*, p. 772.

ECTROICA, from *εκτροω*, *I cause to miscarry*, a name given, by the ancient physicians, to such medicines as have a power to occasion abortion.

ECTYLOTICS, *Ectyotica*, from *ek*, and *tylos*, collat, remedies proper to consume and eat off caluses, warts, and other excrescences, formed on the flesh.

ECTYPE, *Ectypa*, among *Medallists*, an embossed figure, or impression of a seal, ring, or medal; or a figured copy of an inscription, or other ancient monument.

The word is Greek: *aggrava* denotes the original, or model; *sculptura*, the copy, or image, moulded or struck in brass; and *tylos*, *ectypa*, the image in relief, or embossed.

ECTYPS Cratular. See **ANAMORPHOSIS**.

ECU, or **ECUY**, the French crown. See **CROWN**, **ESCU**, and **COIN**.

Ecu ancient, in *Heraldry*, a term signifying the ancient shield. By this they mean the antique triangular-shaped shield, on which the arms of the noble families of France have been painted. This shield is to be seen on old gems, and some ruins; but the modern shield, which is square, and rounded and pointed at the bottom, has banished the use of this.

ECURIE, in the *Mange*, the covert place for the lodging or housing of horses. The word is French. We use *stable* in common discourse.

ECURY. See **ECURIE**.

ECUSSON, in *Heraldry*, an inscutcheon, or little escutcheon. See **ECUTURION**.

ECUYER, in the French *Mange*, is used for the riding-master. Sometimes it denotes certain officers in the king of France's household, who help the king in mounting his horse and alighting, and follow him on horseback, and carry his sword. These are called *ecuyers de quartier*. Gentlemen-usher to the queen of France, and the masters of the horse to princes, and persons of quality, are also called *ecuyers*. Besides these, there are others called *ecuyers cavalcadours*.

ECZEMA, from *exema*, I am externally hot, a name given, by the ancient physicians, to any fiery pultule on the skin.

EDDA, in *Antiquities*, is a system of the ancient Icelandic, or Runic mythology, containing many curious particulars of the theology, philosophy, and manners, of the northern nations of Europe; or of the Scandinavians, who had migrated from Asia, and from whom our Saxon ancestors were descended. Mr. Mallet apprehends that it was originally compiled, soon after the Pagan religion was abolished, as a course of poetical lectures, for the use of such young Icelanders as devoted themselves to the profession of a *fiold* or poet. It consists of two principal parts: the first containing a brief system of mythology, properly called the *Edda*; and the second being a kind of art of poetry, and called *Scaldic*, or *Poetic*. The most ancient *Edda* was compiled by Soemund Sigfusson, furnished the *Learned*, who was born in Iceland about the year 1057. This was abridged, and rendered more easy and intelligible, about a hundred and twenty years afterwards, by Snorro Sturleson, who was supreme judge of Iceland in the years 1215 and 1222; and it was published in the form of a dialogue. He added also the second part in the form of a dialogue, being a detail of different events transacted among the divinities. The only three pieces that are known to remain of the more ancient *Edda* of Soemund, are the *Voluspá*, the *Havamal*, and the Runic chapter. The *Voluspá*, or prophecy of Volu or Fola, appears to be the text, on which the *Edda* is the comment. It contains in two or three hundred lines the whole system of mythology, disclosed in the *Edda*, and may be compared to the Sibylline verses, on account of its laconic yet bold style, and its imagery and obscurity. It is professedly a revelation of the decrees of the Father of nature, and the actions and operations of the gods. It describes the chase, the formation of the world, with its various inhabitants, the functions of the gods, their most signal adventures, their quarrels with *Loke*, their great adversary, and the vengeance that ensued; and concludes with a long description of the final state of the universe, its dissolution and conflagration, the battle of the inferior deities, and the evil beings, the renovation of the world, the happy lot of the good, and the punishment of the wicked. The *Havamal*, or *Sabline Dismissal*, is attributed to the god *Odin*, who is supposed to have given these precepts of wisdom to mankind; it is comprized in about a hundred and twenty stanzas, and resembles the book of Proverbs. Mr. Mallet has given several extracts of this treatise on the Scandinavian ethnics. The Runic chapter contains a short system of ancient magic, and especially of the enchantments wrought by the operation of Runic characters, of which Mr. Mallet has also given a specimen. A manuscript copy of the *Edda* of Snorro is preserved in the library of the university of Upsal: the first part of which hath been published with a Swedish and Latin version, by M. Goranzen. The Latin version is printed as

a supplement to Mr. Mallet's Northern Antiquities. The first edition of the *Edda* was published by Rasmus, professor at Copenhagen, in a large quarto volume, in the year 1765; containing the text of the *Edda*, a Latin translation by an Icelandic priest, a Danish version, and various readings from different MSS. Mr. Mallet has also given an English translation of the first part, accompanied with remarks; from which we learn, that the *Edda* teaches the doctrine of the Supreme, called the Universal Father, and *Odin*, who lives for ever, governs all his kingdom, and directs the great things as well as the small; who formed the heaven, earth, and air; made man; and gave him a spirit or soul, which shall live, after the body shall have mouldered away; and then all the just shall dwell with him in a place called *Ginle* or *Vigslit*, the palace of friendship; but wicked men shall go to *Hela*, or death, and from thence to *Niflheim*, or the abode of the wicked, which is below in the ninth world. It inculcates also the belief of several inferior gods and of goddesses, the chief of whom is *Frigea*, or *Frea*, i. e. *last*, meaning hereby the earth, who was the spouse of *Odin*, or the Supreme God; whence we may infer that, according to the opinion of these ancient philosophers, this *Odin* was the active principle or soul of the world, which uniting itself with matter, had thereby put it into a condition to produce the intelligences, or inferior gods, and men, and all other creatures. The *Edda* likewise teaches the existence of an evil being, called *Loke*, the calumniator of the gods, the artificer of fraud, who surpasses all other beings in cunning and perfidy. It teaches the creation of all things out of an abyss or chaos; the final destruction of the world by fire; the absorption of the inferior divinities, both good and bad, into the bosom of the grand divinity, from whom all things proceeded, as emanations of his essence, and who will survive all things; and the renovation of the earth in an improved state. Tables 1. 2. 70. 76. 33. For a farther account of the *Edda*, see Mallet's Northern Antiquities, vol. ii. 1770, passim.

EDDISH, or **EDDISH**, the latter pasture, or grass, which comes after mowing, or reaping; otherwise called *ner-grass*, *ewsh*, and *ewh*.

EDDY, Sax. *ed*, backward, and *ea*, water, in *Sea Language*, is when the water, at any place, runs back, contrary to the tide, or stream, and so falls into the current again.

The seamen call that *eddy water* which falls back, as it were, on the rudder of a ship under fail, the *dead water*. An *eddy* is that which returns, or is beat back, from any fail, &c.

EDELING. See **EDHILING**, and **ATHELING**.

EDESSENUM, the name of a famous collyrium, reckoned among the number of the *maestemera*, or such as cure certain disorders of the eyes, in one day. It is supposed to have had its name *Edesse* from the city of Edessa, where it was first invented, and in great use. Its composition was this: take gum arabic, tragacanth, sarcocolla, acacia, and starch, of each two drams; opium, four drams; ceruse, eight drams; cadmia, fifteen drams; these were all to be reduced to a fine powder, and afterwards mixed with a sufficient quantity of water, to be used to wash the eyes.

EDGE in *sea language*, is said of a chance, that is making up to it.

EDGE away, is to decline gradually from the shore, or from the line of the coast which the ship formerly cleared, when the sail, nearer the direction of the wind, or larger before the wind.

EDGINGS, in *Gardening*, rows of shrubs, herbs, or flowers, placed by way of borders around beds, compartments, &c. For the *edgings* of compartments, box seems the most proper. See **BOX**.

EDHILING, **EDHILINGS**, an ancient appellation of the nobility among the Anglo-Saxons.

The Saxon nation, says Nithard, Hist. lib. iv. is divided into three orders, or classes of people; the *edlings*, the *frilings*, and the *leas*; which signify the nobility, the freemen, and the vassals or slaves.

Instead of *edling*, we sometimes meet with *edling*, or *edeling*, which appellation was likewise given to the king's son, and the presumptive heir of the crown. See **ATHELING**.

EDICT, an instrument, signed and sealed by a prince, to serve as a law to his subjects.

Edicts have no room in England, where the enacting of laws is not lodged in the king, but in the parliament.

In the Roman law we find frequent mention of the *edict of the praetor*, *quid praetor edixit*, which was a phrase appropriated to the ordinances of the praetor; though it was sometimes also used on other occasions.

In the French law, *edict*, *edit*, make a great figure; they are of various kinds; some importing a new law, or regulation,

gulation, as the *edict* of duels, that of second marriages, &c. Others the erection of new offices, establishment of duties, rents, &c. Sometimes articles of pacification, as the *edict* of Nantz, passed by Hen. IV. in 1598, and revoked by Louis XIV. in 1685; &c.—*Edicts* are all sealed with green wax, to shew that they are perpetual and irrevocable.

Edicts with them are much the same as proclamations with us; but with this difference, that the former have the authority of a law in themselves, from the power which *littera fortis*; whereas the latter are only declarations of a law, to which they refer, and have no power in themselves.

EDICT, *chamber of this*. See CHAMBER.

EDIFICE, *EDIFICIUM*, a building. See BUILDING.

This word is formed of the Latin *edus* and *facio*, I make.

EDILE, or rather **ADILE**. See ADILE.

EDITOR, of *eddy*, I publish, in the commonwealth of learning, a person who takes care of publishing the work of another author, usually an ancient author.

Erasmus was a great editor of ancient writings; the Louvain doctors, Scaliger, Peravius, Fa. Sirmond, bishop Walton, Mr. Hearn, &c. are learned editors; the Benedictines, of the fathers, the Dauphins; of the classics; Hardouin, of the Councils, &c.

EDUCATION, the art of bringing up, forming, and instructing children.

The folies of a too delicate education are well expressed in that device of an ape; which, by over caressing and hugging its young ones, strangles them; with this motto, *emphatanda necat*. Oclavius Ferrarius has a very good Latin treatise on the subject of education, intitled *Clavis*, the name of the centaur who was Achilles's tutor.

Mr. Locke's excellent treatise of Education is known to every body. Quintilian employs the second chapter of his first book in enquiring whether a domestic, or a college, education be preferable, i. e. whether it be better to bring up one's children at home, or send them to the colleges and public schools. After urging all that can be said on either side, he concludes for a college or school education.

The plan of education, whether it be domestic or collegiate, should be suited to the station and views of parents, and to the genius of their children; and it is also right to consult their constitution and inclination. It is of great importance, that those who are destined to occupy superior stations in society, should enjoy the benefits of an enlarged and liberal education; that they should be furnished with every substantial and ornamental accomplishment; and those that are intended for any particular profession or employment should be principally directed to those studies which are appropriated to their respective views; and in every rank of life, an attention to the morals of youth should be a primary object. Though the municipal laws of most countries have made no provision for constraining a parent to bestow a proper education on his children; yet in the case of religion they are under peculiar restrictions in our own country. Some of these restrictions, as they affect protestants who dissent from the religion of the state, may be thought both impolitic and injurious, and have, therefore, lately been considerably relaxed; but those which are designed to prevent the progress of popery are prudent and necessary. Thus, if any person sends a child under his care beyond the seas, to be instructed in any popish college, &c. in the principles of the popish religion, or shall contribute towards his maintenance, he shall forfeit one hundred pounds, besides the disabilities incurred by the child to rent. 1 Jac. I. cap. 4. and 3 Jac. I. cap. 5. 11 and 12 W. III. cap. 2. and both shall be incapable of suing in law or equity, of being executor or administrator, of enjoying any legacy or deed of gift, or of bearing any office in the realm; and he shall forfeit all his goods and chattels, and likewise all his real estate for life. 7 Car. I. cap. 2.

EDULCORATION, of *edulis*, I sweeten, in Pharmacy, is the dulcifying or sweetening of any food, or remedy, by means of honey, sugar, or syrups.

EDULCORATION, in Chemistry, denotes the freshening or purging of any thing of its salts, by repeated lotions, or washings in cold water.

Such is the dulcifying of the precipitates of mercury, metals, &c. by washing away those sharp salts, by whose means they had been dissolved, or which had been mingled with them, to effect a dissolution. See DISSOLUTION.

EDULCORATION, in Metallurgy, is the separating, by a solution in water, of the salts that have been left adhering to a body after an operation. This is properly a kind of moist solution, the saline parts adhering to bodies, not soluble in water, being by that menstruum taken up, and eaten off from the body, and the solution afterwards

separated from the remaining solid, either by subsidence or filtration.

It is proper, in this situation, to enlarge the surface of the body to be edulcorated, by pounding it in a mortar, that the solution may have the speedier success; and for this purpose, it should also be kept continually stirring with a stick, while the water is on it, that all the parts of the body to be edulcorated which otherwise would come of them sink to the bottom. And remain applied against the bottom of the vessel it is performed in, may be made equally at one time or other contiguous to the particles of the edulcorating fluid, by which all solutions are indeed greatly facilitated. Boiling water is also, in some cases, requisite; for the heat of that, by the inward motion and rarefaction it occasions, promotes, in an extraordinary manner, saline solutions.

A perfect solution from the salt, however, is not always obtained by this method; for as every part of the menstruum contains in it a proportionable quantity of the matter dissolved; and there remains always some part of the menstruum thus impregnated in the body to be edulcorated; it is evident that there also remains in it the proportionable quantity of salt for that menstruum. Let us take, for instance, the alkaline salt in wood-ashes, pour hot water on such ashes, and let them boil together for some time; then by decantation, or otherwise, separate the ley or water impregnated with the salt of the ashes, from the ashes themselves; there will remain, after all you can do to pour it off, at least one-fourth part of the ley among the ashes, and of course a proportionable part of the dissolved salt. Pour more water on this, and decant it off again, a quantity of salt, though much less than the former, will again remain; and so on, if the operation be repeated ever so often; only the salt will be in less and less quantity every time. Very frequent repetitions of this operation are therefore always necessary; and even where the operator has tired himself with them, a nice experimenter will always find some small portion of the salt remaining.

To this remaining of the saline particles, in some degree, after ever so often repeated washings, is owing the great loss artificers usually find in reducing the calxes of gold and silver, made with acids. For the small remainder of the acids which yet adhere, being agitated by an impetuous, and especially by an open fire, carry off in their evaporation a great many particles of the metals with them, not even excepting aqua fortis itself, which is said to be, nay, and really is, of a fixing nature, but that only in a certain degree. Cramer, Art. of Ass. 106.

EDYSTONE *light-house*, lying off Plymouth harbour, was first erected by the corporation of the Trinity-house in 1696; in consideration of which, the masters, &c. of English shipping agreed to pay one penny 3. 4. on towards and inwards. It was demolished by the storm of 1703, and re-erected by act of parliament in the 4th of queen Anne, and the same duty on tonnage of ships granted for its support, which law was enforced in the 8th of Anne. It has been since destroyed and rebuilt.

EEL, *Anguilla*, in Ichthyology, a species of the MURRENA. This common eel is the simple coloured *muræna*, with the lower jaw longest; it has three fins, viz. two pectoral, standing on each side, and a single low back-fin, which beginning at some distance from the head, runs along the back to the tail, and returns again underneath as far as the anus. The extremity of this fin, which forms what may be called the tail, is neither round nor square, but subacute. *Eels* vary much in their colour, from a sooty hue to a light olive-green; and those which are called silver eels, have their bellies white, and throughout a remarkable clearness. See GRIOU.

The eel is common in all our fresh waters, ponds, ditches, and rivers; and is generally about two feet in length, though some are often caught much larger.

The fat of eels is accounted vulnerary, and good in an *ulcus*, cafes of deafness, and the hemorrhoids. The dried livers and galls of eels, are recommended by Mr. Boyle, to assist women in hard labour. Boyle's Works, Obs. vol. 2. p. 92.

Eel-fishing is of divers kinds, as snigling, bobbing, &c. See FISHING.

There is scarce any animal, the generation of which has so much perplexed and puzzled the thoughts of the learned and curious as this. Aristotle first gave birth to an opinion, that eels were of no sex, nor did propagate their species like other animals, but were equivocally gendered of the mud; and as wild and absurd a fable as this is, there have not been wanting many, even in these later and more enlightened times, who have given into it. The present age has been so well instructed in the system of animal generation, by the works of Swammerdam, Leeuwenhoeck, Malpighi, Redi, Ray, and a great number

ber of other writers, of the same valuable kind, that there is left no room to doubt but all animals are produced by the copulation of parents like themselves; and the oddity of *eel* being found in new ponds is easily accounted for, when we know that Dr. Plott, and many others, have given accounts of whole droves of them leaping one ditch or pond, and crossing the meadows together to go to another. We know that the *eel*, of all the fishes, lives the longest out of water; and it is not difficult to conceive, that it may, without any inconvenience, spend so much time out of that element as is necessary for the passing from one water to another; and when a number of these fishes have found a new pond, it is no wonder that they continue in it, since they feed on worms and other insects of the earth; and there is probability that there may be found in peculiarly great abundance in the place where the earth has been heavily disturbed, and where they have not been preyed upon.

Though the learned world at this time generally allows, that *eels* are produced like other animals, by parents of their own kind, yet there remain many doubts about the manner in which this is performed; some allowing the *eel* to be like the generality of other animals, of different sexes in the different individuals; and others affirming that they are all hermaphrodites, each having the parts of generation of both sexes. Rondeletius affirms, they are of different sexes; and Mr. Allen, who has given a very curious paper concerning them, in our Philosophical Transactions, is of the same opinion; and both say, that the parts of the sexes may be discovered, on a careful inspection, and some found to be males and others females; but these parts are, in both sexes, they say, buried in a large quantity of fat; and they are of opinion, that hence proceeded the mistake of Aristotle and his followers, who, not being able to find these parts, concluded that they did not exist at all.

Among those who allow the *eel* to be produced like other animals, from animal parents, which have the sexes, some are of opinion that they are viviparous; and others, that they are oviparous; but a gentleman of our nation, Mr. Chairwynd, seems to have determined this great controversy, by observing, that if the aperture under the belly of the *eel*, which looks red in the month of May, he cut at that time, the young *eels* will be seen to come forth alive, after the operation. Mr. Leeuwenhoek says that he found an uterus to every *eel* he examined; and therefore concludes, that they are hermaphrodites; and he supposes that they have no male parts of generation, like those of other animals, but that the office of this is performed by a liquor analogous to the male seed of animals, which is contained in certain glands, situated on the inside of the uterus itself.

The conger, or sea-eel, usually grows to a very great bigness; but the common fresh-water *eel* seems intended to have been limited to a certain small size; yet, at times, there have been caught some which have greatly exceeded this their seemingly fixed limit. The common size of the conger, or sea-eel, see *Fish*, fig. 11, at full growth, is the length of nine or ten feet, and the thickness of a man's thigh; and, when of this size, they will weigh from thirty to forty, or fifty pounds; though Salvian says, they usually do not exceed thirty. Strabo tells us of some of them growing to eighty pound weight; but, by what we see of them, there is reason to believe, that between twenty-five and thirty pounds weight seems their natural limit, at full growth; and that those which exceed it, are like the monstrous common *elny*, accidentally increased to a preternatural bulk. Pliny and Solinus talk of *eels* of thirty feet long; but the largest we find, even of our monstrous ones, come greatly short of that. The conger always has a sort of barb, and an *eel* that has not those, may always be assuredly known by that character alone, to be a true fresh-water *eel*, though ever so large. Of this kind, the Thames, and some other rivers about London, seem to have furnished the largest of any part of Europe. Mr. Dile commemorates the taking of two of these, in the Philosophical Transactions; the one near Crickles in Essex was five feet five inches long, and measured twenty-two inches round. The weight of this was about twenty pounds, which is the first that Aldrovand gives to the fresh-water *eels*, saying, that they sometimes, though very rarely, do come up to this, but that they never exceed it. The other was caught near Maldon, and was seven feet long, twenty-seven inches in circumference, and its weight was thirty pounds. Out of its back and belly there were taken five pounds of fat. This creature seemed to have been brought down the river by the violence of some land flood, and was in a wounded condition when taken by the fishermen, having a hurt upon its back, which it seemed to have got in passing through some mill. Both this and the other were evidently fresh-

VOL. II. N° 108.

river *eels*: and long since these, so lately, indeed as in the year 1748, one of these large *eels* was taken at Limehouse, where it was left on shore by the tide; it was five feet six inches long, and as thick as a man's thigh; its weight was twenty-seven pounds.

EEL, *Electric*. See GYMNOTUS.

EEL, *Indian*, *anguilla Indica*, i. *Ichthyology*, the name of the East Indian *eel*, of which there are two kinds, the one all over spotted with brown, and the other of a fine yellow colour, streaked with red. The flesh of this is not accounted wholesome.

EEL, *Ses*, *anguilla marina*, a fish common under holes of rocks, about the shores in many parts of the East Indies. It is of a dusky brown colour, variegated with rhomboidal spots not unlike those on the skins of snakes. The anterior part of its body is thin and slender, the hinder part very thick; its nose is long, its mouth large, and commonly gaping open, and its teeth very sharp, but very small. It is most extremely fat, and is very wholesome and well tasted; yet those who kill a number of them are said to be affected with tremors, and sometimes with drowsiness, which however goes off without farther mischief.

EELS, *microscopici*, in four parts. The long-bodied animalcules, discovered by the microscope in vinegar, four parts, and many other subjects, have, from their figure, been generally distinguished from the rest of the microscopic animalcules, by the name of *eels*. These, and the other kinds, have been, by the most judicious naturalists, supposed to be produced of the eggs of other animalcules of the fly kind, floating in the air. But those in parts are discovered to be viviparous animals, producing living creatures of their own shape. In order to be always furnished with these minute *eels* ready for the microscope, take such parts as book-binders commonly use, of a moderate consistence, and expose it to the air in an open vessel, and prevent its becoming hard or mouldy, by occasionally stirring it. After some days it will turn sour; and, if examined attentively, you may discern multitudes of exceedingly small, long, slender, wriggling animalcules, which grow larger daily, till you will be able to see them with the naked eye. In order to promote their coming forward, pour now and then a drop of vinegar on the paste, and then they may be preserved all the year: the continual motion of these animalcules will contribute to prevent any mouldiness in the paste, which is best kept in some glass vessel. Apply them to the microscope on a single tale or slipglass, after having first put upon it a small spot of water for them to swim about in, the internal motion of their bowels may be plainly perceived; and when the water is almost dried away, and they are nearly expiring, their mouths may be seen opening to a considerable width. On cutting one of these paste-*eels* in two across the middle, a long and slender tube is seen to thrust out from each of the divided ends, and a number of seeming air tubes from this; but these, examined strictly, appear to be living *eels* of different growths, and all included in their proper membranes; some move themselves but slowly, while others coil and uncoil themselves pretty briskly, and the most mature are seen to make strong efforts towards the disengaging themselves of their enveloping membranes, and at length succeed, and swim at liberty, like their parent animal. The tube thrust out each way, on dividing the body, is properly the uterus of the animal, which in the larger *eels* is seen to be full of dark spots, that are the embryo *eels*; and these dark spots are also to be observed in the young ones, as soon as produced. Phil. Transf. N° 478. p. 13. and vol. xliii. p. 67 and Baker's Microf. 1743. p. 81, &c. See ANIMALCULES.

EELS in vinegar. See VINEGAR.

EEL-fart, is used for the fry or brood of *eels*. Sut. 25. Hen. VIII.

EEL-pout, in *Ichthyology*, the English name of the mustela fluvialis, a fish of the genus *gudus* kind, according to Artedi, and distinguished from the others by the name of the bearded gudgeon, with two fins on the back, and with both jaws of the same length. See GARDNER.

This fish is caught in the Trent, and many other of our rivers, and in some places called a burbot, and is a very delicate fish for the table.

The name is derived from the German *eel-pout*, which is in that language the name of the same fish, and is compounded of the words *eel*, an *eel*, and *pout* or *podd*, a frog; so that the English word should properly be the *eel-frog*. It is commonly, when full grown, about fourteen inches long, and is slender in proportion to its length, and something of the *eel*-shape, but too short for its thickness to be truly so. It is very soft and slippery to the touch, like the *eel*, and is covered either merely with a slimy matter, or else with extremely minute scales. It is of the colour of a teal; its head is large and flat, its nostrils small and round, and its jaws beset with very small

small teeth, which make them feel rough like a file; and there is, beside these, a semicircular spot in the palate, rough in the same manner. There are two fine on the back, and one on the belly, reaching from the anus to the tail; and it has a little beard from the extremity of the lower jaw, and between the nostrils and end of the snout, two others, and seven gills. Willoughby's Hist. Pisc. p. 125. There is another variety of *salpax*, which Linnaeus has made a species of *BLANKING*; these are viviparous, and bring forth two or three hundred young at a time, a little after the depth of winter. They are common in the Edd, at Whitby, in Yorkshire, and are a costly fish.

Eel-fork, a forked instrument with three or four jagged teeth, used for catching eels; that with four teeth is the best. This is struck into the mud at the bottom of the river; where, if it strikes against eels, it is sure to bring them up.

Eel-bush, a term used by the dealers in eels, for such as have black bills along their back.

EFFAIRE, or **EFFRAYER**, in *Heraldry*, a term applied to a beast, when rearing on his hind legs, as if it were affrighted.

EFFECT, the result or consequence of the application of a cause, or agent, on some subject.

It is one of the great axioms of philosophy, that full or adequate effects are always proportionable to the powers of their causes.

EFFECT is also of some farther import in the arts; as when we say in *Painting* and *Architecture*, that such a contrail, or such a drapery, or such an attitude, have a fine or an ill effect, i. e. are beautiful, noble, or the contrary. Too many breaks, and little enrichments, in a building, have a poor effect, i. e. they give it a mean aspect.

EFFECT, in the *Manner*, is applied to the motions of the hand which direct the horse.

They distinguish four effects of the hand, viz. in using the bridle to put a horse forward, draw him backward, and sliding it out of the right hand into the left, or vice versa.

EFFECTS, in *Commerce*, &c. the goods possessed by any person, whether moveable or immovable; particularly those which merchants and dealers acquire by trade. See **CHATELAIN**.

The effects of merchants are usually distinguished into three classes, good, bad, and doubtful. By an ordinance of the French court in 1673, every merchant is obliged to take an inventory or review every year, of all his effects of every kind.

EFFECTS, *VACANT*. See **VACANT**.

EFFECTIONS, in *Geometry*, the geometrical constructions of propositions.

The term is also used in reference to problems and practices; which, when they are deducible from, or founded upon some general propositions, are called the *geometrical effections* thereof.

EFFECTIVE men, in *Military-language*, are soldiers fit for service.

EFFEMINATE, *effeminatus*, according to the Vulgate, are mentioned in several places of scripture. The word is there used to signify such as were consecrated to some profane god, and prostituted themselves in honour of him.

The Hebrew word, *Andol*, translated *effeminatus*, properly signifies consecrated, and hence was attributed to those of either sex, who publicly prostituted themselves in honour of Baal and Ashtar.

Moses expressly forbids these irregularities among the Israelites; but the history of the Jews shews, that they were notwithstanding frequently practised. Levit. xxiii. 18. Calmet. Dict. Bibl. in voce.

EFFENDI, in the *Turkish language*, signifies *master*; and accordingly it is a title very extensively applied; as to the emirs and empires to the priests of mosques, to men of learning, and of the law. The grand chancellor of the empire is called *effendi*.

EFFERVESCENCE, is popularly used for a light ebullition, or a brisk lively motion produced in a liquor by the first action of heat, without any notable separation of its parts.

EFFERVESCENCE, in *Chemistry*, is not applied to all ebullitions or motions produced by fire, but only to those resulting from the mixture of bodies of different natures; which, by their acting on one another, occasion a heat, resembling the ebullition or boiling produced by fire.

The two most common opposites, acids and alkalies, on being mixed, excite a great ebullition or frothing, but no great heat; but the solutions of some metals in aqua fortis excite intense heat, and emit flame. Aromatic oils, mixed with acid mineral spirits, actually kindle and burn with violent explosion; and some vegetable substances, putrefying with moisture, will sometimes

heat so as to kindle what lies dry about that part of the heap where the putrefaction happens. Thus heaps of dung will grow hot, and haycocks often kindle into actual fire. Phil. Trans. N^o 476. p. 475.

Charvin defines *effervescence* more scientifically to be a violent expulsion of the air, out of the pores of the particles of one body, by the intrusion of the particles of another body mixed therewith into those pores before possessed by air.

In order for *effervescence* to take place, the particles of the latter body must be supposed conformable, both in bulk and figure, to the pores of the other, so that they may enter and fill the same like wedges; and beside, there must be a strong degree of attraction between the particles of the two bodies, stronger than the attraction or force of cohesion between the particles of either of the bodies alone.

Hence it should seem, that *effervescence* only differs from fermentation in the degree of explosion; which in *effervescence*, occasioned by the greater purity and freedom of the acid and alkali, is greater than in fermentations; but **FERMENTATION** is now used in a more restricted sense.

Of *effervescences*, some are hot, and others cold. Of the first kind are those produced by mixture of oil of tartar per deliquium, with spirit of vitriol; quicklime, with cold water; all acid spirits, with alkaline or earthy bodies; aqua fortis, spirit of vitriol, spirit of nitre, aqua regia, &c. with metallic bodies, marcasites, and minerals; coral, with lemon or orange juice; marble, with spirit of salt; chalk, crabs eyes, mother of pearl, and all shells, with acids. In all which, the *effervescence* are attended with a more or less intense heat.

The principal bodies in which *effervescences* happen, are,

1. Native vegetable acids, as most juices of trees, shrubs, and plants, that run in the spring; most juices of untimely summer fruits; particular juices, when ripe, as those of oranges, lemons, citrons, tamarinds, sorrel, wood-sorrel, and crabs; fermented vegetables, as the meals when they turn sour, Rhemish and Moselle wine, and tatar; vegetables twice fermented, native and distilled vinegars; the acids of animals, from turbit or acid vegetable-aliment, as in the chyle, four milts, whey, butter-milk, and the whey thereof.
2. The native fossil acids, as the acid of sulphur, alum, or vitriol; or these acids, as they lie concealed in sulphur or vitriol fumes; or as thence extracted by a violent fire, or a stronger acid, as in the spirit of nitre, salt, alum, vitriol, or sulphur.
3. True fixed alkalies, made of any vegetable matter by burning; the more volatile alkalies, whether spontaneous, as in garlic onions, scurvy grass, mustard, &c. produced by putrefaction from animal or vegetable subjects, or procured from the same by distillation and burning.
4. Certain bodies, improperly called alkalies, only on account of their agreeing with genuine alkalies, in fermenting with acids; these are many of the bones, and other carths, bones, chalk, corals, crabs eyes, horns, hoofs, and nails of animals, pearls, shells of fish, &c. stones, and teeth.
5. The seven metals.
6. The minerals, antimony, bismuth, lapis calaminaris, hematites, lime, and the like.

Hence we have four general rules: 1. That the bodies of the first class almost constantly make an *effervescence* with those of the third and fourth, either sooner or later, and with more or less strength, as they are in themselves weaker or stronger; this *effervescence* continues till the point of saturation is obtained, and then ceases; and at that time usually the acrimony both of the one and the other of the substances is softened. 2. The bodies of the first class make an *effervescence* with those of the fifth, though only some with others, and not universally; some do this with more, and others with less strength; and at the end, vitriols are usually produced. 3. The bodies of the first class act in the same manner with those of the sixth. 4. The bodies of the third, fourth, fifth, and sixth classes, being mixed together, as scarce found to make any *effervescence*; hence acids are found to have this effect in particular along with the rest, though here it is limited. The best spirit of vinegar, poured upon oil of tartar per deliquium, makes no *effervescence* at first, but it does afterwards, and in doing so, weakens the alkali.

Pure volatile alkali, when freed from its oil, makes an *effervescence* with distilled vinegar; but much more cold than heat arises in the ebullitions of this kind; whereas, the generality of other *effervescences* produce heat in various degrees, from the least sensible warmth up to actual flame. A dram of oil of roses, mixed with two drams of Gläuber's spirit of nitre, raises a thick smoke, and in the midst of it a strong red flame, and the matter is reduced to a dry spongy mass: in this case the *effervescence* is not made with acid and alkali, but with acid, and a very rich oil. There are also two hard and cold bodies,

viz. iron and sulphur, which being ground together, and made into a pilla with water, make a spontaneous *effluvia*, and will even produce actual fire and flame. *Barth. Chem. part. p. 310.*

Oil of vitriol, and oil of turpentine, mixed together, produce such a vehement heat, that unless they be mixed drop by drop, they are apt to burst forth into a flame, and break the glass.

Generally, the substances, which contain a sensible quantity of the inflammable principle, are those which in similar circumstances produce the greatest heat in *effluvia* with acids; and of all acids, the nitrous produces the greatest heat, when it dissolves these bodies.

Powdered coral, mixed with distilled vinegar, produces a cold *effluvia*, which has been accounted for hence, that the pores of the coral being very great, it may be easily dissolved in the acid spirit, without any great friction or collision of the parts, such as would be necessary to generate any considerable heat.

An *effluvia* may also be produced by the mixture of many other cold liquors. See DISTILLATION.

EFFERVESCENCE, in *Physic*, a term appropriated by Portius and others, to signify that working of wine, which is by some, though improperly, called fermentation, thereby confounding two very different things. Fermentation, according to these authors, is nothing else but the action and re-action of the internal parts of the acid and alkali of the fluids, by which the spirits are separated without precipitation; whereas, they say, by *effervescence*, there are no spirits separated, so that all fermentation is done by means of *effluvia*; but all *effluvia* does not amount to fermentation. Fermentations are properly the mutual straggles between contrary principles, as between acid and alkali, or the like; but *effluvia* will happen between principles of the same kind, provided one be much stronger than the other. Thus a stronger acid, poured upon a weaker, will raise an *effluvia*, but no fermentation. The *effluvia* of wine is not, however, of this kind, but the acid and alkali which are in them must raise this by their action upon one another, the alkaline parts combating with the acid ones, till they have wholly fatigued them, and then the *effluvia* ceases.

It has been observed by many, that wine in the casks will always *effluvia* more or less strongly, at the time of the blossoming of the vines. This has been supposed by the vulgar to be owing to something of sympathy, or such hidden causes; but it is only owing to the heat of that season, which for the two falls at work upon one another. Portius de Vin. Rheum.

EFFICACIOUS, EFFECTUAL, in *Theology*. Within these two years there have been great disputes on the subject of *efficacious* grace. Grace is usually divided into sufficient and *efficacious*; though the Jesuits hold, that there is no grace sufficient but what is *efficacious*, i. e. but what effectually determines the will to act.

Efficacious grace is that which enlightens the mind, and touches the heart, in such a manner, as always to produce its effect, however it be opposed or resisted by the will. See GRACE.

Some divines maintain, that *efficacious* grace is *efficacious* of itself. *Efficacious* grace of itself, if there be any such thing, is that which produces its effect merely of itself, and not in virtue of any consent of the will. Calvin is the first that used the term, *gratia efficax per se, grace efficax of itself*. A late divine holds the *efficacy* of grace in itself to consist in this: that *efficacious* grace is always joined with a moral necessity of doing the thing it inclines to; and sufficient grace, joined with a moral impotence of doing it. The Arminian and Popish way of conceiving the necessity of *efficacious* grace, is, that this grace is never wanting, at least to the righteous, except through their own default; that they always stand in need of other inner graces truly and properly sufficient, in order to draw down this *efficacious* grace; and that these do infallibly draw it down, when they are not rejected, though they often remain without effect, because men resist, instead of yielding their consent thereto.

F. Malebranche maintains, that the mutual commerce between soul and body, i. e. life, has no other vinculum or principle but the *efficacy* of God's decrees; and that second causes have no proper *efficacy*, &c.

EFFICIENT, in *Philosophy*. AN EFFICIENT cause is that which produces an effect. See CAUSE and EFFECT. Philosophers usually distinguish four kinds of causes in nature; the *efficient*, *final*, *formal*, and *material*. See each under its proper article.

The school-philosophers are exceedingly divided as to the nature and efficacy of an *efficient* cause. Aristotle defines it, *id unde, that from which*; or the first principle of change and rest, i. e. of production and conservation.

The *efficient* is called *id unde, that from which*; as the end or final cause is that *propter quod, for which*, the exemplar, *ad quod, that to which*; the manner, *ex quo, that out of which*; and the form, *per quod, that by which*.

Others of the schoolmen define *efficient* to be *principium per se in una fine mutatum in aliam*. The Ramists, after Plato and Cicero, define an *efficient* to be that, a *qua res, from which a thing is*; to which a great number objecting, that a thing may be also from its end, adds, that an *efficient* is that, *a qua res una causatur respectu*. Others define *efficient* to be, *qua per actionem causat, that which causes by acting*; for to which, every body knows, it to act; and hence neither a procatartick, nor an exemplary cause, are properly *efficient*, though usually ranked among them.

Lastly, others define a *efficient* to be a cause, a *qua aliquid producat, from which something is produced*; consequently, what arises from such a cause is called an *effect*; and thus God is the *efficient* cause of the world, and the world the effect of God; to which definition of an *efficient*, all the former definitions are reducible.

An *efficient* cause, then, is either physical, as the fire is the *efficient* cause of heat; or moral, as an adviser is the cause of a murder; or universal, which in various circumstances produces various effects, as God and the sun; or particular, as a horse which produces a horse; or univocal, which produces an effect like itself, as a horse begets a horse; or equivocal, according to the old doctrine, as the sun producing a frog; or natural, which acts not only without precept in opposition to artificial, but also from within, and according to its own inclination, in opposition to violent, as fire acts when it warms; or spontaneous, as a dog eating; or voluntary and free. Others consider *efficient* causes, either as principal, or as instrumental; others, either as next or remote, or as mediate or immediate; others, in fine, divide *efficient* causes among all the kinds of beings, natural and supernatural, spiritual and corporeal, substantial and accidental, vital, and not vital, &c.

But the most celebrated division of *efficient* is that into *first* and *second*.

A *first efficient* cause is that between which and the effect there is some necessary connection: of which kind there is none but God alone.

A *second efficient* cause is that from which an effect follows in consequence of the will or constitution of the Creator, and which the Cartesians call an *occasional* cause.

But these precarious or occasional concurrence, in reality, no causes at all, but only antecedent effects. This is easily shown: for 1. All action, at least all corporeal action, is continued in motion; but motion can only result from the first cause, it being an allowed principle, that body of itself is inert and inactive. The true cause of motion, therefore, is a spiritual, not a corporeal nature. 2. But neither can a finite spiritual nature be the chief cause of motion; for there is no necessary connection between the will, e. g. of an angel, and the motion of a body, nor between that of any other being except God. Thus when an angel wills, a stone moves, because God has constituted such a law between the will of the angel and the motion of the stone; and thus we move our hands when we please; not that the soul is the principal cause of such motion, but only the occasional cause. See CAUSE.

EFFICIENTS, in *Astronomy*, the numbers given for an operation of multiplication, called also the *factor*. See FACTOR and COEFFICIENT.

The *efficient* are the multiplicand and multiplier.

EFFIGY, EFFIGIES, a portrait, or representation of a person to the life. See PORTRAIT.

EFFIGY, is also used for the print or impression of a coin, representing the prince's head who struck it.

EFFIGY, in *account* is *degradatio*, denotes the execution or degradation of a condemned, contumacious criminal, who cannot be apprehended or seized.

In France, they hang a picture on a gallows or gibbet, wherein is represented the criminal, with the quality or manner of the punishment: at the bottom is written the sentence of condemnation. Such persons as are sentenced to death are executed in *effigy*.

EFFLORESCENCE, of *ex, out*, and *flor, flower*, in *Botany*, denotes the blooming of a flower.

EFFLORESCENCE, in *Chemistry*, denotes an operation which certain bodies undergo, when a kind of meal or powder is formed on their surfaces; and this may happen either by decomposition or drying; as to calx in the first case, and to the crystals of marine alkali, Glauber's salt, alum, &c. in the second.

EFFLORESCENCE, in *Medicine*, a breaking out of humours in the skin; as in the measles, or the like. See EXANTHEMA.

EFFLUENT fever, is sometimes used for an inflammatory fever.

Dr. Morgan proposes to cure such by sweats raised by low cooling drinks.

EFFLUVIUM, a burst, or exhalation of minute particles from any body; or an emanation of subtle corpuscles from a mixed, sensible body, by a kind of motion or transpiration.

Olfiferous bodies, every one knows, are continually emitting substantial *effluvia*, by means whereof it is, that they excite in us the sense of smelling. These minute *effluvia* are sometimes perceived by the eye, in form of fumes and vapours.

Some bodies are found to emit *effluvia* for a great number of years, without any considerable loss, either as to bulk or weight; as diverse odorous bodies, the tenacity of whose emanant corpuscles is incredible; not but that the loss they sustain by the continual emission of *effluvia* may be made up to them by the reception of other similar *effluvia* of the same kind of bodies diffused through the air.

It is added, that these *effluvia* are emitted in manner of radii, rays, in *obtem*; and the circumference or bound of the activity of the radiation exhibits the same figure as is that of the radiant. This the astronomer sufficiently prove, from the ratio of the refraction of the atmosphere. For the law of the emission of these *effluvia*, see **QUALITY**.

That *effluvia* may considerably operate upon, and have great effects on bodies within the sphere of their activity, is proved by Mr. Boyle, in an express Treatise on the Significancy of *Effluvia*; where he shews, 1. That the number of corpuscles, emitted by way of *effluvia*, is immensely great. 2. That they are of a very penetrating nature. 3. That they move with vast celerity, and in all manner of directions. 4. That there is frequently a very wonderful congruity, or incongruity, in the bulk and shape of these *effluvia*, compared with the pores of the bodies they penetrate into and act upon. 5. That in animal and organic bodies, particularly, these *effluvia* may excite great motions of one part of the frame upon another, and thereby produce very considerable changes in the economy. Lastly, that they have sometimes a power of procuring assistance in their operations from the more catholic agents of the universe, such as gravity, light, magnetism, the pressure of the atmosphere, &c.

That *effluvia* are emitted to very great distances, we have a notable proof in odiferous *effluvia* being in many cases perceived at the distance of many leagues. Again, that the generality of *effluvia* retain the proper colour, smell, taste, and other properties and the effects of the bodies whence they proceed, and this even after they have passed through the pores of other solid bodies, we have abundant proof. And the same we see confirmed in sympathetic inks and powders, and in the sagacity of blood-hounds, &c.

The wonderful extension of *effluvia*, and the small diminution of the body they issue from, is one of the strangest problems in physics.

The determinate nature of *effluvia*, according to the principal influences we have of them, are reducible to these three heads: 1. That these *effluvia* being, by condensation, or otherwise, retained, they appear to be of the same nature with the body that emitted them. 2. Their determinate nature may be sometimes discovered by the difference that may be observed in their sensible qualities, so far as those *effluvia* which are endowed with them proceed from the same sort of bodies, and yet those afforded by one kind of bodies being in many cases manifestly different from those which fly off from another; this evident disparity in their exhalation argues, that they retain distinct natures, according to the nature of each body from which they proceed. 3. We may discover this different nature of *effluvia* from their effects upon other bodies than the organs of our senses; considering that the effects which certain bodies produce on others by their *effluvia*, being constant and determinate, and always different from those which other agents produce by their emissions on the same or other subjects, the distinct nature of the corpuscles, emitted on this occasion, may be sufficiently judged of, were it only from this. Boyle on *Effluvia*.

EFFLUVIA, in *Medicina*, are designed as the cause of various disorders, especially of the contagious kind. Thus, when a considerable quantity of putrid *effluvia* has been admitted into the blood, besides acting thereupon slowly, by way of inquinamentum, or ferment, they soon immediately affect the nerves, and thereby so bring on some extraordinary disorder of the whole frame. Hence arise spasms, obstructions, palpitation, a high degree of fever, or a languid circulation, thickness, or intense heat, and a variety of contrary symptoms, according to the

different affection of the nerves. To putrid *effluvia* is likewise owing the jail-dysentery, which is the same with the hospital-fever. See **HOSPITAL-FEVER**.

Effluvia issuing from corrupted substances, which consist of the phlogiston or sulphur principle, these they so readily emit with, and volatilize acids, as appears from the increase and particular change of the fumes, &c. It is proper to remark, that from a simple putrid substance the phlogiston does not arise alone, but combined with the saline parts of the body; for this principle when single, is perhaps imperceptible to the smell; and, when dissolved in these salts, is never, so far as is known, pestilential; so that the deleterious particles of rotten substances seem to consist of a certain combination of the sulphurous with the saline principle, which united, not only become the most irritating stimuli to the nerves, but act upon the humours as a putrid ferment in promoting their corruption. Pringle's Obs. on Diseases of the army, p. 186. 385, &c. See **ATA FLEVA**, and **MALIGNANT**.

Dr. White, availing himself of the discoveries of Dr. Priestley, has applied *nitrous* AIR in the manner proposed by him, for ascertaining the salubrity of different specimens of air, and the effects of various kinds of *effluvia* upon it. The apparatus employed by him for this purpose consisted of a barometer tube, graduated by inches and decimals, and of such a bore, that an ounce phial of the air to be examined, being thrown into it through a small glass funnel (after it had been filled with water and inverted into a vessel of the same fluid) occupied about 134 decimal parts of an inch, or nearly 134 inches. On adding half an ounce of nitrous air, the mixture generally occupied, at first, about 205 decimal parts; and in half an hour, when the whole diminution may be supposed to have taken place, Dr. White observed the space or number of decimal parts then occupied by the two airs; and subtracting it from 205, considered the remainder as the number indicating the state of purity in the particular air he had occasion to examine. When he mixed the air in his garden with the nitrous air in the above mentioned proportion, the space occupied by the mixture in half an hour was 145; and this subtracted from 205, gives 60 for the state of the common atmospheric air in that place, and at that time. But had he used the same quantity of perfectly noxious air instead of the air in the garden, there would have been no diminution, and the mixture would have stood at 205, so that 0 would express the condition of that particular air; and therefore he marked the extent of his scale from 0, indicating the most noxious or mortal air to 60° or 61°, which was found to be the mean state of the atmosphere in more than 200 experiments. With this apparatus Dr. White found the difference between the air in the city of York and that of the country, not far from the city walls, to be 3°, the former being 59° and the latter 62°. The air of his bed, on entering it at night, was 62°, but reduced by the next morning to 58°, the bed curtains being open, and the room large and airy. By breathing the same air as long as he could without inconvenience, he reduced it from 62° to 40°. These in an eight-ounce phial, which had contained a small piece of fresh veal forty-eight hours, was reduced from 62° to 10°, and yet the flesh was not putrid. Two ounces of black mud, taken from a sinking morass at York, being put into an eight-ounce phial of air, reduced it in twelve hours from about 60° or 62° to 34° or 36°. When this mud became perfectly dry, so as to be pulverized, the diminution it occasioned was only from 62° to 60°; but when this powder was again reduced to mud, by the addition of a little water, and enclosed in a phial as before, it affected the air so as to reduce the diminution from 62° to 49°; and on standing longer, from 62° to 24°. When more water was added, so as to swim at some height above the powder, which had subsided, the air again, tried by itself, never produced a greater reduction of the diminution than from 62° to 50°. These experiments confirm the observations of Sir John Pringle and other medical writers, who have remarked, that the diseases peculiar to low marshy situations seldom begin to appear till the water is so far evaporated as to leave a black and slimy mud; that they cease when the bogs and marshy ground have been drained and become perfectly dry; and that, on the other hand, the danger arising from miasms and bogs is, in a great measure, obviated, on their being laid wholly under water; or in the words of this ingenious writer, the putrid fermentation is either prevented by too much mixture, or the *effluvia* are absorbed in passing through the superincumbent bed of water. Phil. Trans. vol. lxviii, part i. art. 13.

The earth sends forth *effluvia* and fumes in great abundance, and many things attributed to other agents, are really

really performed by them. Dr. Woodward has very justly attributed great effects to them on fossils of many kinds; and it is possible many more of the present appearances of subterranean bodies may be owing to them than are at present imagined. The figures and delineations on stones, in form of trees and shrubs, have often their origin from these *effluvia*, getting into the cracks of them: and it is possible, that the flaccidities, which we find on the roofs of caverns, may be in great part also formed by their means. Phil. Trans. N° 169. p. 920.

As for the *effluvia* proceeding from stagnant waters, mines, &c. see *Air Mephitic and DAMP*.

EFFLUXION, a flowing out, from *ex*, out of, and *fluere*, to flow.

EFFRACTURA, a word used by Ambrose Paré for a peculiar species of fracture of the skull, in which the bone is at once broken and depressed.

EFFRONTES, in *Church History*, a sect of heretics, in 1534, who scraped their forehead with a knife till it bled, and then poured oil into the wound. This ceremony served them instead of baptism. See *BAPTISM*. They are likewise said to have denied the divinity of the Holy Spirit.

EFFUSION, the pouring out of any liquid thing with some degree of force.

In the ancient heathen sacrifices there were divers *effusions* of wine, and other liquors, called *libations*.

EFFUSION, or **PURSION**, in *Astronomy*, denotes that part of the sign *Aquarius*, represented on celestial globes and planispheres, by the water issuing out of the urn of the Water-bearer. See *AQUARIUS*.

EFFUSION of blood, *effusio sanguinis*, in our *Old Writers*, is used for the maul, fine, or penalty, imposed for the shedding of blood. This the king used frequently to grant to lords of manors. Among others it was granted to the Abbot of Gloucestre.

EFT, or **EFF**, in *Zoology*, the name of a creature very common in all parts of England, and called also *newt*, and the *faust*, and by others the *common lizard*, *laccus vulgaris*.

The back or snout of this creature is oval and obtuse; its back of a rusty iron-colour; its feet have each five toes, and are armed with very sharp though small claws. That toe which is in the place of the fore-finger with us is the longest of all; and that which answers to our thumb is placed lower. Ray's Syn. Quad. p. 264.

We have several species of this animal with us. 1. The common land *eft*, with the black spotted belly. 2. The snake-like *eft*, which is frequent in our heaths. 3. The small brown land *eft*. This is very scarce. 4. The yellow scaly land *eft*, described by Plot in his History of Staffordshire. And 5. The brown and black spotted water *eft*. Plot's Staff. p. 252.

The land *eft*, or as the naturalists often call it, the land *foamander*, has something very remarkable in its outer coat. Its skin often appears dry, like that of the lizard kind, but often also it appears wetted, and as if covered with a fine shining varnish: the change from one to the other of these states is usually performed in an instant, and it frequently becomes immediately wet all over on touching it. It also continues, under the skin, a sort of milky liquor, which spurs out to a distance on pressing the body of the animal.

The passages for this milk are a vast number of pores or holes, many of which are plainly visible to the naked eye; and very probably the last-mentioned liquor, which covers the skin in manner of a varnish, may be the same with this, its white colour not being distinguishable when it is spread to thin over the surface of the animal. This milk resembles very much the milky juice which the tithymalus, and many other of the succulent plants afford on being cut or broken. It is of an insupportably acid and styptic taste; and though the tongue receives no injury from touching it, yet the sensation is so violent, that one is apt to imagine there must be a wound made in it. This animal, when bruised, yields also a very disagreeable smell.

It has generally been supposed, that this animal is of a poisonous nature; and the famous *foamander* of the old writers seems to be of the same genus, if not the same animal. Mr. Maspertuis, determined to inform the world of the truth in regard to these remarkable particulars, caused a large number of these animals to be brought to him, which the country people, who had caught them about the bottom of old walls, brought to him with as much caution as if they had been vipers.

From his trials, it appeared very evident, that the stories of this creature's being poisonous, are as idle and groundless as those of its living in the fire.

One thing remarkable this gentleman observed in his dissections of the animal, which was, that he found in several of the females, at once clusters of eggs, and

living young ones. The eggs formed clusters resembling those of the ovaries of birds, and the young ones were contained in two tubes, or long pipes, the coats of which were perfectly transparent, and the young ones were easily distinguished through them; and there were counted in one female fifty-four of these, all living and vigorous. Mem. Acad. Par. 1727.

The water *eft* affords an excellent opportunity of seeing the circulation of the blood by means of the microscope, particularly of the solar one. By this apparatus the vessels are seen beautifully delineated on the skin; and the tide of blood, in the large ones, is equal to that of the stream of water which is shown in hydrostatical experiments thrown out of a vessel by condensed air. In either of these cases, you can see no appearance of separate drops of globules, but the whole forms one continued body. In the lesser vessels the globules are seen passing along very swiftly, yet evidently separate one from another.

It is remarkable, that in the tail of this animal there seem a greater number of vessels than are immediately necessary to the circulation of the blood; for, when thus examined, there will be often seen two parallel vessels, in one of which only the circulation is performed, and this successively in one and the other of the vessels, the tide often leaving the one wholly empty, which had just before been full and circulating in the other. Phil. Trans. N° 460. p. 728.

EGG-STONES, in the *Medical History of the American Indians*, a name given to certain stones, said to be found in the stomach of a certain species of water newt, or *eft*, in the manner of the bezoars in other animals. The waters of Brazil, Cuba, and Mexico, abound with this species of *egg*; but it does not seem well attested, that this sort of stone was ever found in any of them by those who have dissected numbers of them, on purpose to search for it. We have in Europe swallow-stones, and other such things, whose names, and their fabulous histories, would import their being produced in animals. As many swallows have been destroyed in England in looking for these stones, as news in Mexico in looking for those; and by the appearance of the American as well as the European stones, they both seem to be dug out of the earth, and to have been once the teeth or other parts of fishes. Redi, Experim.

The virtues of the *egg-stone* of Mexico are celebrated by Ximenes, and all others who have been upon the spot. It is said to be a certain remedy for the gravel, and all other nephritic complaints, and even to break and dissolve the stone when already concreted in the bladder. But this account of its virtues seems as improbable as that of its origin. Redi tried these and many other stones of famous character among writers, and found no effect in any of them. These *egg-stones* never produced any visible effect in his trials, in nephritic complaints, nor the eagle stone in women's labour, nor the stones swallowed by Caymans in quarts, though Menardus looks on these last as infallible in this case.

EGGERMINATE, of *ex*, out, and *germen*, bud, in *Botany*, signifies to bud or spring out.

EGESTION, from *egere*, I cast out, in *Medicine*, the same with dejection.

EGG, in *Natural History*, a part formed in the females of certain animals; which, under a shell or cortex, includes an embryo, or fetus of the same species; the parts whereof are afterwards displayed and dilated, either by incubation, or by the accession of a nutritious juice.

The species of animals that lay eggs are particularly denominated *oviparus*; and the part wherein the egg is formed, the *ovary*.

Of the various kinds of eggs, those of hens or pullets being the most usual, and which have been the most observed, we shall say something of the structure thereof, and the generation of the chick therein.

The exterior part, then, of a hen's egg is the shell, a white, thin, friable cortex, including all the other parts, and defending them from injuries. The matter of this shell is a fine, absorbent earth, soluble in acids, and calcareous or convertible into quicklime. See *Animal Earth*.

Eggs with double shells are no unusual phenomenon, Harvey is very diffuse on the rationale of these appearances in his treatise De Generat. Animal.

Immediately under the shell lies the membrana communis, which lines the whole cavity of the shell, adhering pretty closely to it, except at the bigger end, where a little cavity is left between them, containing a small quantity of air, which with age grows bigger. Under this membrane are contained two albumina, or whites, each wrapped up in its own membrane. In the middle of the inner white, is the vitellus; or yolk, enclosed likewise in its separate involucre or cover. The outer albumen

albumen is oblong or oval, accommodated to the figure of the shell: the inner is spherical, and of a more crass or viscid substance, and the yolk is of the same figure.

The albumen is miscible with water; and when exposed to a gentle heat, as that of a healthy man's body, it grows continually more and more liquid, till at length losing all its consistence, it dissolves into a liquor resembling urine; and at the same time it wastes sensibly, and at last leaves nothing but a thin pellicle resembling paper. It is, in reality, a matter entirely of the nature of animal jelly, but of that kind which is coagulable by heat: for the albumen, if applied to a degree of heat something greater, inspissates, and hardens into a whitish, concrete, flaky substance, with the loss of some of its finer fluid part, which escapes in form of a fume.

In effect, if an egg be laid on coals not the most intensely hot, the same finer fluid will be found sensibly to transude the pores of the shell. Add, that if spirit of wine be poured on the fresh albumen of a new-laid egg, a coagulation is immediately produced as if by fire; and this the more perfectly, as the spirit and the albumen are more intimately mixed. By this means, the white of an egg is defended from all putrefaction.

Distilling the albumen by a retort in a sand heat till it be brought to a dryness, it yields an incredible quantity of water, which has most of the properties of the whole mass.

The white of an egg makes an extraordinary masticum. Being boiled hard in the shell, and afterwards suspended in the air by a thread, it refuses and drops down into an insipid foetidous liquor, which appears to be than anomalous unaccountable masticum. It is much used by Paracelsus; and will, though it contain nothing sharp, oleaginous, or saponaceous, make a thorough solution of myrrh, which is more than either water, oil, spirits, or even fire itself, can effect. Boerhaave, New Meth. Chem. part ii. p. 358, seq. See MYRRH.

The origination of the albumen is somewhat obscure. It is matter of common observation, that eggs, while in the ovaries of their birds, e. gr. of hens, consist only of a yolk, without any albumen; and in eggs, when boiled, it is apparent, there is only a contiguity, but no connection between the two parts, since they are easily separated, without a rupture of any thing, except in the places where the chalazæ are found. The result of the latest observations on this subject is, that the vitellus being descended into the ovary, the cavity of the ovary distils the matter of the albumen, and glues, or annexes it to the surface of the yolk. Harv. de Generat. Anim. exerc. xiv. p. 57. Bellin. de Mot. Cord. p. 40. Burger. Lex. Med. in voc.

The yolk of the egg is also composed of a gelatinous matter like the white, which coagulates and hardens with heat, and contains a considerable quantity of mild fat oil, that may be separated from it by expression.

The albumen is the nutritious juice, whereby the egg is diffused and nourished till it becomes big; and the yolk serves it for food after it is well grown, and partly also after it is hatched; for a good part of the yolk remains after exclusion, being received into the chicken's belly, as a store-house, and conveyed thence by the appendicula, or ductus intestinalis, as by a funnel, into the guts, serving instead of milk.

At each end of the egg are the chalazæ, which are, as it were, the poles of this microcosm: these are white, dense bodies, consisting each of three little globules like hail joined together; by these, not only the several membranes are connected, or knit together, by which means the several liquors are kept in their proper place and position to each other, but they serve also to keep one and the same part of the yolk uppermost, let the egg be turned which way it will.

About the middle, between the chalazæ, on the side of the yolk, and in the membrane thereof, is a little vesicle or bladder, not unlike a vetch, or lentil, called the CIRCULAR, and by some the eye, of the egg. In this vesicle is contained an humour, in, and of which the chick is generated.

All these parts of a pullet's egg are found in all other eggs to which the definition of an egg properly and strictly agrees; such egg being that, of a part whereof the animal is formed, the rest serving for its food. Accordingly, the first feed, or flamen of the chick, is in the circular.

Eggs, in diet, serve for an agreeable and nourishing aliment; but it is necessary, that they should be fresh, and moderately coagulated by heat. If, upon holding them to a candle, they appear of a turbid colour, they are usually reckoned flat; or if, upon presenting them to the fire, they exhale a moisture, they are fresh. The yolk is used in many medicinal preparations, as emulsions, &c.

Eggs, Albumina, or whites of, are of some use in medicine, though rather externally, in the preparation of collyria for the eyes, and anacatharsis, on account of their cooling, agglutinating, and abstrigent quality, that internally.

Albumina are used for burns, and in some mixtures with bole armeniac, &c. for consolidating fresh wounds, and under bandages, and complices to prevent the separation of bones after reduction. A late writer recommends them as a secret in the jaundice. Junck. Const. Therap. tab. xlii. p. 379. Quine. Dispens. part. ii. § 2. p. 204. Ephem. Germ. dec. 3. an. 2 obs. 35, p. 43.

Besides medical, the whites of eggs have also their chemical uses, e. gr. for the clarifying of liquors; to which purpose, being mixed, and incorporated with the liquors to be clarified, and the whole afterwards boiled, the whites of eggs are by this means brought together, and hardened, and thus carry off the gross parts of the liquor along with them. They likewise form a very white and shining varnish, which is applied to several kinds of work, and particularly to pictures.

Egg-shell white, in Painting, is sometimes used in water-colours, and preferred to flake or the Trop-white: it is prepared by peeling off the inner skin, and levigating the shell to a proper fineness, and washing over the powder.

Egg, what is termed continuum ovum, among Naturalists, denotes a sort of hen's egg, much smaller than ordinary, vulgarly called a red's egg, from which it has been fabulously held, that the cockatrice or basilisk was produced. Brown. Vulg. Err. lib. iii. cap. 7.

The name is taken from an opinion, that there are the last eggs which hens lay, having laid a hundred before; whence continuum, e. d. the hundredth egg.

These eggs have no yolks, but in other respects are like common eggs, having the albumen, chalazæ, membranes, &c. in common with others.

In the place of the yolk is found a body resembling a little serpent, coiled up, which doubtless gave rise to the tradition of the basilisk's origin from hence. Their formation is probably ascribed by Harvey to this, that the yolks in the vitellus of the hen are exhausted before the albumina. Harvey de Generat. Animal. Exerc. 12.

M. La Peyronie has carried the history of the *ova continua* to a greater length, as well as certainly: a hen was brought to him, which, for a considerable time, laid no other eggs. The same hen was also observed to crow like a cock, and to render by the cloaca a thin yellow matter, much like the yolk of an egg diluted in water. Upon opening her, she was found hysterical; a bladder as big as the fist, full of water, was found contiguous to the oviculus, which it pressed and crowded in such manner, as not to leave the cavity thereof above five lines in diameter; so that a common egg, such as it is when it falls from the ovary into the tube, could not pass without bursting, by which the yolk was let out, and discharged another way. Mem. Acad. Scienc. an. 1710. p. 730.

Eggs, preservation of. Mr. de Reaumur, of the Paris academy, thinking nothing that could be a public benefit the cognizance of a philosopher, bestowed considerable pains on finding a method of preserving eggs for a long time, and succeeded at length so far in it, as to be able to produce eggs of months, many years old, which tasted as fresh and well as if they had been laid but the day before. The egg always is quite full, when it is first laid by the hen, but from that time it gradually becomes less and less to its decay; and however compact and close its shell may appear, it is nevertheless perforated with a multitude of small holes, though too minute for the discernment of our eyes. The effect of these, however, is evident, by the daily decrease of matter within the egg, from the time of its being laid, a fluid matter is continually perishing through these perforations of the shell, which occasions the decay; and this is carried on in a much quicker manner in hot weather than in cold. To preserve the egg fresh, there needs no more to be done than to preserve it full, and stop its transpiration; and the plain and rational method of doing this, is by stopping up these pores through which the matter transpires, with a matter which is not soluble in watery fluids, and therefore cannot be washed away by the matter perished by the egg; and on this principle, all kinds of varnish, prepared with spirit of wine, will preserve eggs fresh for a long time, if they are carefully rubbed all over the shell. This might seem to most people a very common and cheap substance for this purpose; but the misfortune is, that in country places, where it should be put in practice, no such thing is to be had; and the poorer sort of country people are not easily brought into the use of any thing to which they are not accustomed.

To obviate the difficulty arising from this, Mr. Reaumur thought of substituting in the place of varnish some other substance more common; and soon found, that another substance, which is very cheap, and every where to be had, would very well supply the office of varnish; for experiments proved, that any hard fat would have the same effect. The best of all fat for this purpose, is tallow; but a mixture of that of mutton and of beef is still better. The fat is to be dipped into it, and immediately taken out again; and it is then in a state to keep perfectly fresh more than a twelvemonth. *Memoirs Acad. Scienc. Par. 1735.*

The only difficulty attending this method is, that the egg cannot be so easily plunged into the fat, as that all their surfaces shall be covered by it; for if they are held in a pair of pincers, the parts of the egg where the pincers touch will be bare; but the egg may be suspended by a loop at the end of a thread, and by that means plunged in; and the thread being then coated over with the fat, as well as the surface of the egg, will preserve that part which it covers as well as the coat of fat will the rest. The great care is to use this means while the egg is perfectly fresh; it ought indeed to be done on the very day when they are laid; for if the evaporation is begun, and the empty space once made, there is room for a fermentation, which never terminates but in the destruction of the egg.

There is one advantage in this use of fat rather than varnish, which is, that the eggs rubbed over with it boil as quick as if nothing had been done to them, the fat melting off as soon as they touch the hot water; whereas the varnish, not being soluble even in hot water, only becomes moistened by it, and still hanging about the egg, prevents the transpiration of juices, necessary to bring the egg to that state in which it is to be eaten. When the egg which has been preserved by fat, is taken out of the water, there remains very little fatness upon it, and what there does is easily wiped off with a napkin, the egg is as nicely fresh as if laid but the day before, and no palate can distinguish the least difference.

The method of preserving them by means of fat, is greatly preferable also to that by varnish, when they are intended for putting under a hen to be hatched; as the fat easily melts away by the heat, while the varnish remains and impedes the hatching. By this means the eggs of foreign fowl might be sent over and hatched here, whereby many beautiful and valuable birds may be naturalized among us.

At Tonquin they are said to keep eggs entire for three years, by covering them up in a palis made of albes and bines.

EGG OF AN. See **AN.**

Egg of a fly. After the congress with the male, the female fly is seldom so much as twenty four hours before she begins to deposit her eggs; on some substance proper to give nourishment to the worms that are to be produced from them.

The eggs are but a little time in hatching; and the growth, and all the changes of the animal, take up but a little time. The creature is found to make its way out of the upper part of the egg; and it is not more than three weeks from the laying of the egg that is taken up, before the creature is seen in the form of a perfect fly, if a female, and ready to deposit hers.

Among the butterfly class, the female has but one congress with the male, by which the eggs are fecundated, and immediately after it begins to deposit her eggs, and continues to do so, without interruption, till she has finished; but it is much otherwise with the two-winged flies; for they, after having laid one set of eggs, have repeated congresses with the male for several days; and, after every one of these, lay a new set.

The female of the butterfly class does not deposit her eggs on any plant at random, on which she happened to be placed when the male, coupled with her, but searches out such a species of plant for leaving them on, as is what the larva when in the caterpillar state, and what the young caterpillars, to be hatched from them will be able to feed on, that they may find food ready for them at the moment of their birth. She does not scatter them about irregularly, and without order, but she disposes them with perfect symmetry; and fastens them one to another, not by their own glutinous nature, but by a viscid liquor, which she separates for that purpose. In many species also, where the hinder part of the body of the female is covered with long hairs, she by degrees throws off all those hairs, and with them makes a nest for the eggs; she is laying, where they are kept very soft and safely, till the time of their hatching. This, indeed, is the whole business of her life; and when the eggs are

all laid, she dies. *Memoirs Acad. Scienc. Par. 1735.* The eggs of butterflies are of very different sizes, according to the species; they are also of many different figures, some are spheric, others segments of spheres, others conic, in different forms and degrees: not is this all, their surfaces are very different also in the different kinds. Some are elegantly wrought, as it were; some dented; and others more deeply notched at the sides; and others channelled or furrowed all over. In short, the most ingenious artist could scarce contrive so many various ornaments as there are on these eggs, all which also are invisible to the naked eye, being discoverable no way but by the microscope.

The eggs of the different species of the two-winged flies are also of very different figures.

There are some species which fasten their eggs to the sides of vessels of water; these all by oblong eggs; some of them, however, are perfectly smooth on all parts; and those of other species smooth only on their inner surface, and ridged longitudinally on the other. What is also the more remarkable in these, is, that they all have a fine thin flake running down all along the two sides, diametrically opposite; and these two bands surrounding the whole egg in this manner, have much the appearance of a case, and give the egg the appearance of being enclosed in a paper frame. It is probable, that the use of this frame is to hold the body of the egg the better fastened against the vessel; and probably those eggs which have it not, are deposited from the body of the female fly with a viscid matter about them, in sufficient quantity to fasten them on without this assistance.

There are some eggs of the fly kingdom which must necessarily be held fast to some other body, in order for the worm to be able to make his efforts towards the opening of them, without carrying them away; and some of the species require much more through attachments of this kind than others.

On the stalks of the common meadow grasses there are also frequently found the eggs of flies deposited in great numbers. On other stalks of grass, one may often see also yellow spots and blotches, which may naturally enough pass with an incurious observer for misadventures of the plants; but, when examined with the microscope, they appear to be, in reality, clusters of eggs, and amass in different numbers: sometimes also they are formed perfect and whole, and at others with their ends open.

These last are such eggs from which the worms have made their way. These worms are white, and have a variable head, armed with two hooks, but their changes are not known. *Reaumur, Hist. Insect. vol. iv. p. 376-383.*

Egg of a gnat. There are few creatures in the winged kingdom more prolific than the gnat. Its whole series of changes, from the egg to the perfect animal, is usually accomplished in three weeks or a month; and there are commonly seven generations of them in a year, in each of which every female is the parent of two or three hundred young ones, if all the eggs come to proper maturity. These eggs are arranged by the animal in the form of a small boat, and each separate egg is of the shape of a mincepin. The thicker ends of these are placed downwards; they are all firmly joined to one another by their middles; and their narrower, or pointed parts, stand upwards, and make the upper surface of the boat of eggs, as it were, rough or prickly.

When these eggs are examined singly by the microscope, they appear not exactly of the mincepin shape; the larger end is rounded, and terminated by a short neck, the end of which is bordered with a ridge, which makes a kind of mouth. The neck of each of these is sunk within the water on which the boat swims; for it is necessary that it should keep on the surface, since if wholly submerged, the worms could never be hatched.

It is only in the morning hours that the gnats are to be found laying their eggs; and then they will frequently be found about the surfaces of such waters as are in a proper condition to give support to their young. The female gnat here places herself on a small flick, the fragment of a leaf, or any other such matter, usually near the water's edge, and places her body in such a manner, that the last ring but one touches the surface of the water; the last ring of all, where there is the passage for the eggs, is turned upwards, and every egg is thrust out vertically; and the creature, when it is almost disengaged, applies it against the sides of the already formed cluster, to which it readily adheres, by means of a viscid glutinous sticking matter with which it is naturally covered, like the eggs of many other insects. The present difficulty to the creature, is the placing of the first laid egg in a proper position to receive the rest, and sustain themselves, and them in a proper direction; these she, with great precaution, places exactly, by means of her hinder leg; and when a sufficient number of them are thus

thus arranged together, the rest is easy, because they serve as a support to all the following. Reamur, vol. iv. c. 615, &c.

ÆGEO, improperly so called, is that, of the whole whereof the animal is formed: such as are the eggs of flies, butterflies, &c. which Aristotle calls *ovum*. The two have this farther difference, that whereas the former, after they are excluded from the female, need no external nutriment, nor any thing but warmth and incubation, to bring the *fœtus* to perfection: the latter, after they are fallen out of the ovary into the uterus, require the nutritious juices of the uterus to distend and enlarge them; whence they remain much longer in the uterus than the other.

The principal differences among eggs, properly so called, are, that some are *perfect*, i. e. have all the parts above described, while in the ovary or uterus; and others, *imperfect*, as not having all those parts till after they are excreted or laid; such are the eggs of fish, which, after they are brought forth, assume an albumen to themselves in the water.

Another difference is, that some are *fructified*, and others not: the first are those which contain a *fœtus*, injected by coition of the male; to dispose them for conception; the rest, not impregnated with this *fœtus*, never breed young by incubation, but always purely.

An egg fructified contains the rudiments of the chick, before the hen has set upon it. By the microscope, we see, in the middle of the chorion, the plain carina of the chick, swimming in the liquor or humour: it consists of fine white vessels or fibrils, which the warmth of future incubation enlarges, by rarefying and liquefying the matter first of the albumen, and then of the vitellus, and pressing them into the vessels of the carina, for a farther preparation, digestion, assimilation, and accretion, till the chick, too big for its coverlet, breaks the shell, and is delivered.

Malpighi has made very curious observations with the microscope, of all the changes that happen in the egg, every half hour of incubation; and the learned Dr. Moore has given a summary of several observations of this kind. *Med. Ess. Edinb. vol. ii. art. 10.*

Vollus, and divers other authors, are very solicitous about settling the question, which was formed first, the egg or the pullet. *De Idol. lib. iii. cap. 78.*

In Egypt, they hatch their eggs by the heat of a furnace, or oven, and frequently have seven or eight thousand chickens come forth at a time. An account of the method hereof we have in the Philosophical Transactions. See **HATCHING**.

It was anciently thought, that none but birds and fishes, with some other animals, were produced *ex ovo*, from eggs; but the generality of the moderns incline to think, that all animals, even man himself, is generated the same way. Harvey, de Graaf, Keenringius, and several other great anatomists, have strenuously asserted this opinion, that it now generally obtains.

In the testes of women, are found little vesicles, about the size of green peas, which are accounted as eggs; for which reason these parts, which the ancients called *testes*, the moderns call *ovaries*. These eggs, fructified by the most volatile and spirituous part of the seed of the male, are detached from the ovary, and fall down the Fallopian tubes into the uterus, where they grow and increase.

This system is countenanced and confirmed by abundance of observations and experiments. M. de St. Maurice, upon opening a woman at Paris, in 1683, found a focus perfectly formed in the testis.

Among the ancients, the egg was the symbol of the world; it being a tradition among them, that the world was made of an egg; whence eggs became of singular importance in the service of Cybele, the mother of the Gods. Some of their deities, they say, were likewise produced from eggs.

Berger, in his treatise de Natura Humana, lib. ii. cap. 5. p. 401, makes no scruple to give it as his opinion, that the only difference between animals, called *oviparus*, and those denominated *viviparus*, consists in this: that the former cast their eggs out of the body, and lay them in nests; and that their eggs contain all the nourishment requisite for the fruit, or fœtus; whereas, in the latter, the eggs are only laid from the ovary into the uterus; that they have but little juice; and that the mother furnishes the rest.

There is not so much as a plant, whose generation, according to the sentiment of Empedocles, and since him of Malpighi, Haller, Fabric, &c. Aquapendente, Grew, and others, is not effected by this means of eggs.

Egg, wind. See **WIND-EGG**.

Egg, fish, Africanus. See **ECHINODERMATA**.

Egg, rat. is a name which some authors give to a

kind of bezoard, found in the stomach of the cow kind.

Egg, in Architecture, an ornament of an oval form, cut in the echinus, or quarter-round of the Ionic and Composite capitals. The profile, or contour of the echinus is enriched with eggs and anechors, alternately placed. See *Tab. Archit. p. 10.*

Egg, Philophaea, in Chemistry. See **THEORY OF METALS**.

EGILOIS, in Botany, a name given by Sponius's interpreter, to the plant which that author and Avicenna call *alchamir*. Their descriptions of the plant abundantly prove, that it is the same with the achillea of the Greek writers; and this word *egilos* seems only a barbarous name for that plant, formed on a mis-spelling of the achillea.

EGITILLIA, a name by which some have called the stone **AGROTILLA**.

EGLEANTINE, or *suave briar*, a species of Rose.

EGLEOPALA, the name of a species of Gray bluish snail.

EGOITOS, a term used by Van Helmont, to express the light of understandings, by which we reflect and reason within ourselves.

EGRA *sal*, *Egrasum sal*, a name given by Hoffman, and other writers, to a purging salt, extracted from the waters of Egra by evaporation. The waters of this place are in great esteem for many diseases, and are, by Hoffman himself, in some respects, preferred to the Pyrmont, as containing less ochre and calcareous earth. The salt is wholly of the nature of Glauber's salt, so is also that of many other springs thereabout, and even in our country.

Egra water, *Egrasæ aqua*, the water of a medicinal spring, near that place in the German dominions. It is famous for cleansing the viscera, obstructed with viscid matter, and is found of great service in all hypochondriacal cases, and all diseases arising from infections of the viscera; it gently purges by stool, and affords a salt, known among the German writers by the name of *Egrasum sal*.

EGULEITTE, in the *Moor*. See **YERKING**.

EGUISCE, see **AIGUIQUE**.

EGYPTIANS, popularly *Gypsis*, in our statutes, a kind of impostors and jugglers, who disguise themselves in uncouth habits, smearing their faces and bodies, and framing to themselves a cunning language, wander up and down, and under pretence of telling fortunes, curing diseases, &c. abuse the common people, trick them of their money, and steal all that they can come at. There are several statutes made against them.

Egyptians coming into England are to depart the realm in fifteen days, or be imprisoned, by 22 Hen. VIII. cap. 16. And by 1 and 2 P. & M. cap. 4. any person importing them into this kingdom, shall forfeit forty pounds; and if they remain here above one month, or if any person, fourteen years old, comfort with them, they are guilty of felony, without benefit of clergy. 5 Eliz. cap. 20. And we are informed by Sir M. Hale, that at one Suffolk assizes, no less than thirteen *Gypsies* were executed upon these statutes, a few years before the Restoration. See also 39 Eliz. cap. 4. 5 2. 17 Geo. II. cap. 5. 1 2.

The origin of this tribe of vagabonds is somewhat obscure; at least, the reason of the denomination is so. It is certain, the ancient *Egyptians* had the character of great cheats, and were famous for the subtilty of their impostures; whence the name might afterwards pass proverbially into other languages, as it is pretty certain it did into the Greek and Latin; or else, the ancient *Egyptians*, being much versed in astronomy, which in those days was little else but astrology, the name was on that score assumed by these tellers of good fortune.

Be this as it will, there is scarce any country of Europe but has its *Egyptians*, though not all of them under that denomination: the Latins call them *Ægyptii*; the Italians, *Cigani* and *Cingari*; the Germans, *Zigener*; the French, *Bohemians*; others, *Saraceni*; and others, *Tartars*, &c.

Munster, Geogr. lib. III. cap. 5. relates, that they made their first appearance in Germany, in 1417, exceedingly tawny and sun-burnt, and in pitiful array, though they affected quality, and travelled with a train of hounding-dogs after them, like apbles. The above date should probably have been 1517, as Munster himself owns, he never saw any till 1524. He adds, that they had passed from king Sigismund of Bohemia, and other princes. Ten years afterwards, they came into France, and thence passed into England. Several historians inform us, that when Ismael Selim conquered Egypt, in the year 1517, several of the natives refused to submit to the Turkish yoke; but, being at length subdued and banished, they

they agreed to disperse in small parties over the world, where their supposed skill in the black art gave them an universal reception, in that age of superstition and credulity. In a few years the number of their profelytes multiplied, and they became formidable to most of the states of Europe. Paquiere, in his *Recherches*, lib. iv. chap. 10, relates a less probable origin of the *Gypsies*, thus: on the 17th of April 1427, there came to Paris twelve penitents, or persons, as they said, adjudged to penance, viz. one duke, one count, and ten cavaliers, or persons on horseback: they took on themselves the character of *Christians of the Lower Egypt*, expelled by the Saracens; who, having made application to the pope, and confessed their sins, received for penance, that they should travel through the world for seven years, without ever lying on a bed. Their train consisted of 120 persons, men, women, and children, which were all that were left of 1300, who came together out of Egypt. They had lodgings assigned them in the chapel, and people went in crowds to see them. Their cars were perforated, and silver buckles hung to them, their hair was exceedingly black, and fizzled; their women were ugly, thievish, and pretenders to selling of fortunes. The bishop soon afterwards obliged them to retire, and excommunicated such as had shown them their lands. By an ordinance of the states of Orleans, in the year 1500, it was enjoined all these impostors, under the name of *Behemians and Egyptians*, to quit the kingdom, on penalty of the gallies. Upon this they dispersed into lesser companies, and spread themselves over Europe. The first time we hear of them in England was in the year 1530, when they were described by the statute already cited, 22 Hen. VIII. cap. 10. They were expelled from Spain in 1501. Du-Cange, Ralph, Volsterranus, making mention of them, affirms, that they first proceeded or strolled from among the *Uxiæ*, a people of Persia or Persia.

EGYPTIAN year. See YEAR.

EHREITIA, in *Botany*, a genus of the *pentandria monogynia* class of plants, with a double-called berry, single bifoliate seeds, and a margined stigma. There are 10 species.

EIA, or EY, in our *Old Writers*, are used for an island. Hence the names of places ending in *ey*, denote them to be islands. Thus, Ramley, the isle of Rams; Sleeppey, the isle of Sheep, &c.

EIA, is also sometimes used for water; and hence the names of places near waters, or lakes, terminate in *ey*.

EIDER-duck. See DUCK.

EJACULATION, in *Medicine*, the act of emitting seed, from the Latin, *ejaculare*, is cast outwardly. See EMISSION.

EJACULATOR, in *Anatomy*, a name applied to two muscles of the genitalia, from their office in the ejaculation of the seed.

The *ejaculatoriæ* arise from the sphincter of the anus, and advance along the urethra as far as the middle thereof where they are inserted laterally.

The same denomination is likewise given to two muscles of the clitoris, which, arising from the sphincter ani, advance laterally along the labia, and are inserted aside of the clitoris.

EJACULATORY, in *Anatomy*, is a term applied to two little ducts, or canals, arising from the vesiculae seminales. The *ejaculatory ducts* are about an inch in length: towards the vesiculae, they are pretty wide; but they contract themselves as they approach towards the urethra, which they penetrate together.

Some authors also apply the name *ejaculatory* to the vasa deferentia.

EICETE, called also *HEICTA* and *HICTA*, heretics of the seventh century, who made profession of the monastic life.

From that passage in Exodus, where Moses and the children of Israel are said to have sung a song in praise of the Lord, after they had passed the Red-Sea, wherein their enemies had perished, the *Eicete* concluded, that they must sing and dance, to praise God aright; and as Mary the prophetess, sister of Moses and Aaron, took a drum in her hand, on the same occasion, and all the women did the like, to testify their joy, by playing, beating, and dancing, the *Eicete*, the better to imitate their conduct herein, endeavored to draw women to them to make profession of the monastic life, and assist in their mirth.

EJECT *infra terminum*. See QUARE *ejeci*.

EJECTION, the act of throwing out, or discharging any thing at some of the excretories, as by stool, vomiting, or the like.

EYERIONS *custodia, ejusdem de garda*, in *Law*, a writ which lies against him that calls out the guardian from any land during the minority of the heir.

Vol. II. N. 109.

EJECTION *firmæ*, a writ that lies for the lessee for years, who is ejected before the expiration of his term, either by the lessor or a stranger.

Also *ejusdem* may be brought by a lessor against the lessee, for rent in arrears, or holding over his term, &c. Reg. Orig. 227. But *ejusdem* is now become an action in the place of many real actions, as writs of right, formesdone, &c. which are very difficult, as well as tedious and chargeable; and this is the common action for trying of titles, and recovering of lands, &c. illegally kept from the right owner. Though, where entry is taken away by descents, fines, and recoveries, dissensions, &c. *ejusdem* may not be brought; so that all titles cannot be tried by this action.

The method of proceeding in the action of *ejusdem* is, to draw a declaration, and therein sign a lease for three, five, or seven years, to him that would try the title; and also sign a casual ejector or defendant; and then deliver the declaration to the *exoror*, who serves a copy of it on the tenant in possession, and gives notice in writing at the bottom, for him to appear and defend his title; so that he, the alleged defendant, will suffer judgment by default, whereby the true tenant will be turned out of possession; so this declaration the tenant is to appear, at the beginning of next term, by his attorney, and consent to a rule to be made defendant, instead of the casual ejector, and take upon him the defence; in which, he must confess lease, judgment, entry, and ouster, and at the trial stand upon the title only; but in case the tenant in possession does not appear, and enter into the said rule in time, after the declaration served, then, on affidavit being made of the service of the declaration, with the notice to appear, the court will order judgment to be entered against the casual ejector by default; and thereupon the tenant in possession, by writ *habere facias possessionem*, is turned out of his possession. On the trial in *ejusdem*, the plaintiff's title is to be set forth from the person last seized in fee of the lands in question, under whom the lessor claims down to the plaintiff, proving the deeds, &c. and the plaintiff shall recover only according to the right which he has at the time of bringing his action. And here, another who had title to the land, upon a motion made for that purpose, may be defendant in the action, with the tenant in possession, to defend his title; for the possession of the lands is primarily in question, and to be recovered, which concerns the tenant, and the title thereto is tried collaterally, which may concern some other.

By a late statute, in all cases between landlord and tenant, when half a year's rent shall be in arrears, the landlord, having lawful right to re-enter for non-payment, may serve a declaration in *ejusdem* on the tenant, without a formal demand or re-entry; or he may affix such declaration on the door of the demised messuage, or notorious place of the lands, which shall be deemed a legal service; and upon proof that half a year's rent was due before the declaration was served, and no sufficient distress on the premises, the lessor shall have judgment and execution; which if the lessee suffer without paying the arrears and costs, and without filing a bill in equity to be relieved within six months, he shall be barred from all relief, except by writ of error; and the lessor shall hold the premises discharged from the lease; but if the tenant or lessee tender to the lessor, or bring into court the rent in arrears, together with costs, all further proceedings shall cease; and if the lessee be relieved in equity, he shall enjoy the demised premises according to his lease, without obtaining a new one. Stat. 4 Geo. II. cap. 28. and 11 Geo. II. cap. 10.

EIGHT FOIL, or *Double Quarterfoil*, in *Heraldry*, a modern difference, denoting the ninth fess of the first fess.

EIGHT, *piece of*. See *PIECE of eight*.

EIGHTH pair of nerves. See NERVE.

EIGNE, from French, *aisné*, in *Law*, is used for eldest, or first-born. Thus we say, *bastard signe*, and *maître puits*, for the elder bastard, and the younger lawfully born.

EILAMIDES, from *ελας*, *I. involer*, a word used by Hippocrates, to express the meninges, or membranes of the brain, the dura mater and pia mater.

EINBLINDER, in *Veterinary*, the name of a sort of lampræy, without eyes, called by the writers on these subjects the *lampæta caeca*, or *blind lampræy*. It is very small, not exceeding the common dew-worms in length or thickness. It has no scales; but its body is divided by annular lines, into eighty-four rings, just in the manner of the large worms. Its mouth is in the under part of its head, and is round, and always open. It has a cavity in the middle of its head, like the rest of the lampræys, for admitting water, and has seven gill-holes on each side. It has the common long fin running on the ridge of the back, but has no other. Willeghby's Hist. Pisc. p. 107.

EINECIA, in our *Old Writers*, is used for promiscuity. It is sometimes written *Einicia* and *Einia*. See *LINCEY*.

EIRE, see *EVAE*.

EIRESIQNE, *Eiresione*, from *εἰρεσις*, *in tranquillity*, an olive branch bound about with wool, and crowned with all sorts of fruit, which was carried in procession in the Athenian festival, called *Πανεσμία*. Pott. *Archæol. Græc.* lib. ii. cap. 20. tom. i. p. 225.

EISETERIA, *Eiseteria*, from *εἰσέρω*, *to enter*, in antiquity, the day on which the magistrates at Athens entered upon their office; upon which it was customary for them to offer a solemn sacrifice, praying for the preservation and prosperity of the commonwealth, in the temple of Jupiter *Βουλάς*, and Minerva *Βουσία*; i. e. the Council-house. Pott. *Archæol. Græc.* lib. ii. cap. 20. tom. i. p. 225.

ELA *Calli*, in *Botany*, the name of a shrub which grows in sandy soils, in some parts of the East Indies, about twice as high as a man. The bark of the root is triturated, and drunk in water in which rice has been boiled or washed, is recommended against the dropsy, and is said to be a very mild medicine; which Mr. Ray justly wonders at, as the plant is full of acrid caustic milk; which, however, when exhibited with butter in which it has been boiled, proves a mild and gentle purgative. The leaves heated at the fire, provoke urine; and the steam, or vapour of a decoction of them, contributes to alleviate and remove pains in any part of the body. The juice, expressed from the leaves, either warmed or a little toasted, cures pains of the ears, if put into them. It also removes specks in the eyes, if drop into them, and contributes to the cure of swellings in the puerpera, if the body is washed with it.

ELABORATION, the act of finishing or perfecting any thing with labour and time.

The term is chiefly used in *Medicine*, where the chyle, blood, and semen, are said to be well elaborated, when they are well conditioned, have undergone all the secretions, mixtures, impregnations, and circulations, necessary to bring them to perfection.

If the chyle went directly from its receptacle to the breasts, it would not be sufficiently elaborated to afford good milk. See *MILK*.

ELABORATORY. See *LABORATORY*.

ELAGNUS. See *AGNUS CASTI*.

ELAGNUS, in *Botany*, a name used by some authors for the pale-roses, the Dutch myrtle or gaul. Metret. Plin. p. 82.

ELAGNUS, in *Botany*. See *WILD OLIVE*.

ELACARPUS, in *Botany*, a genus of plants of the *pentandria monogamia* class; the calyx of which is a five-leaved perianthium; the corolla consists of five torn petals, the fruit a drupe, and the seed a crisp nucleus. There is one species.

ELAMELLI, in the writings of the ancient *Physicians*, the name of a substance, thus described by Dioscorides. In *Polymyria*, a country of Syria, the *Elamell*, which is an oil thicker than honey, and of a sweet taste, flows from the trunk of a tree. Two cyath of this oil, he adds, drunk with a lumen of water, evacuate crude and bilious humours by stool. There was much good obtained from the giving of this medicine; but it had this remarkable effect, that those who took it were seized with a torpor, and privation of strength for a time: this was, however, of no ill consequence, but people knew of and expected it, and used always to keep those persons awake who had taken it, and the symptoms soon went off. The same author also adds, that the oil was sometimes prepared from the buds of the tree; and fetched this kind was esteemed the best that was old, thick, fatty, and not foul or turbid. It was judged of a heating nature, and frequently applied externally to the eyes, with good effect in the cure of dimness of sight, and contributed to the cure of leprosy, and pains of the nerves. Herodotus Barbarus has a strange conjecture in regard to the substance, which is, that it was the same with the mounds mentioned in Scripture, only used in medicine instead of food; but the account which Dioscorides gives of the effects of it is a very sufficient answer to the absurdity of such an opinion. Dioscorides, lib. i. cap. 17.

ELASACCHARUM. See *ELASACCHARUM*.

ELAZOTHESUM, *Elazothum*, in *Antiquity*. See *ARTIFERUM*.

ELASIS, in *Botany*, a genus of the class of *palmeæ*; both the male and female flowers have a six-leaved calyx; the corolla of the male is divided into six segments, and that of the female six prisms; the stamens of the former are six, and the stigmas of the latter three; the fruit is a fibrous drupe, containing a single three-valved nut.

ELANULA, in *Antiquity*, the name of a peculiarly hard stone.

ELAPHÉBOLIA, *Elaphébolia*, in *Antiquity*, a festival kept in honour of Diana *Elaphébolia*, i. e. the Huntress, for which reason, a cake made in form of a goat, and upon that account called *ελαφίον*, was offered to her. For a further account of it, see Pott. *Archæol. Græc.* lib. ii. cap. 20.

ELAPHÉBOLION, *Elaphébolion*, in ancient *Chronology*, the ninth month of the Athenian year. It consisted of thirty days, and answered to the latter part of our February, and beginning of March. See *MOON*.

It was thus called from the festival *Elaphébolia* kept in it.

ELAPHIS. See *ELAPA*.

ELAPHODONCUM, in *Botany*, the wild persic. See *PERSEUS*.

ELAPHOCAMELOS, in *Zoology*, a name by which several authors have called the Peruvian camel, usually called *llama*, and employed there as a beast of burden. See *GUANA*.

ELAPHONESUM *maris*, a name used by the ancients to express a species of marble used in statuary, and called also *Præconaxium marmor*; it was of a bluish white, variegated with tender veins of black. See *PRÆCONAXIUM*.

ELAPS, or ELAPSIUM, by some called also *elaps*, the name of a serpent denoted by many authors, and met with by Hellonius in the island of Lemnos; it grows to about three feet long, and is on the back of a dark grey, with three longitudinal black lines, running from the head to the tail, and on the belly of a bright yellow, according to Adioyandus. The people of Lemnos call it *ελάσιον*.

ELASMIS, in *Natural History*, the name of a genus of fossil bodies, of the tale class, the distinguishing characters of which are, that they are composed of small plates, in form of triangles, each of which is either single, and not farther split; or, if complex, little only to a certain degree, and that into somewhat thick laminae. See *Tab. of Fossils, Class I.*

The word is derived from the Greek, *ελασμα*, a lamina or plate; the several component parts of these masses being in many small plates.

The bodies of this genus have been used to be named *micæ*, *glaucon*, and *conchites*, by authors, in the same manner with the *trachites*. There are only four known species of this fossil.

ELASTIC *bodies*, in *Metaphysics*, is that which, by being struck or stretched, has its figure altered; but endures, by its own force, to resume the figure; or, it is a springy body, which when compressed or condensed, or the like, makes an effort to get itself at liberty, and to repel the body that constrained it. Such is a sword-blade, a bow, &c. which are easily bent, but presently return to their former figure and extension. This property belongs more or less to almost all bodies; but as there are none which restore themselves with the same force with which they were compelled, there are no bodies that are perfectly *elastic*.

The word is formed from the Greek, *ελαστος*, *inflexile*, of *ελασσω*, *to impel*, *push*, &c. See *SYNOPSIS*.

Elastic bodies are either *natural* or *artificial*; those most eminent for their spring power, among *artificial* bodies, are steel, brass, ivory and marble balls; leather, skins, membranes; brass, silver, iron, and steel chains or wires; nerves, guts, hemp, and flax strings, &c.

Amongst *natural* bodies, the principal are air, sponges, the branches of green trees, wool, cotton, leathers, &c. It is disputed, whether or no water hath any *elastic* force; the most common opinion has long been, that it has none of itself; and that if it shews any, it is owing to the air contained therein. See *Cause of Motion*, under which article the contrary is demonstrated.

The principal phenomena observed to obtain in *elastic* bodies, are, 1. That an *elastic body*, (i. e. a body perfectly *elastic*, if any such there be) endeavours to restore itself with the same force whereabout it is pressed or bent.

2. An *elastic* body exerts its force equally towards all sides; though the effect is chiefly found on that side where the resistance is weakest; as is evident in the case of a bow shooting out an arrow, a gun exploding a ball, &c.

3. *Elastic bodies*, in what manner soever struck, or impelled, are inflected, and rebound after the same manner. Thus a ball yields the same found in what manner, or on what side soever it be struck.

4. A body perfectly fluid, if any such there be, cannot be *elastic*, if we allow that its parts cannot be compressed. See *FLUID*.

5. A body perfectly solid, if any such there be, cannot be *elastic*, in that having no pores, it is incapable of being compressed. See *SOLID*.

6. Hard, long, flexible bodies, apt to acquire *elasticity*, do

do it chiefly in three ways; either by being extended, by being contracted, or by being bent.

7. Bodies, in dilating themselves by their elastic power, exert a greater force at the beginning of their dilation, than towards the end thereof; because the bodies are more compressed at first, and the tenacity is always equal to the compression.

8. The motion, whereby compressed bodies restore themselves, is usually an accelerated motion. See DILATATION.

9. The elastic property of bodies seems to differ, according to their greater or less compactness or density: thus, metals, by being hammered, are rendered more compact, and also more elastic. Tempered steel is much more elastic than soft steel; and the density of the former to the latter as 7669 to 7738. Cold like-wire condenses the bodies, and renders them more elastic; whilst heat, that relaxes them, has the contrary effect. M. Bessler has found, that cannon balls are projected further from cold guns, than from the same guns, when heated; and the string of a violin is known to act more strongly in winter than in summer. We must except, however, air, and other elastic fluids, which acquire an increase of elastic force from heat. *Muschenb. Int. ad Phil. Nat. vol. ii. p. 231. 4to.*

We may add, 10. That the elastic force of bodies is the same in vacuo as in the air, when other circumstances are alike.

For the laws of motion and percussion in elastic bodies, see MOTION and PERCUSSION.

ELASTIC CURVE. See CATENARIA.

ELASTICITY, or ELASTIC FORCE, in Mechanics, denotes a property or power in natural bodies, which denominates them elastic, and by which they are restored to the figure and extension they had lost from any external cause.

The cause, or principle, of this well-known and important property is variously assigned: the Cartesian account for it from the effort of the *materia subtilis* to pass through pores that are too narrow for it. Thus, say they, in bending or compressing an elastic body, e. g. a bow, its parts recede from each other on the convex side, and approach on the concave; consequently, the pores are contracted or straitened on the concave side; and if they were before round, they are now oval; and the materia subtilis endeavouring to pass out at those pores, thus straitened, must make an effort, at the same time to restore the body to the first state it was in when the pores were more patent and round, i. e. before the bow was bent.

Other philosophers account for elasticity much after the same manner as the Cartesians, with this inconsiderable difference, that, instead of the subtle matter of the Cartesians, they substitute a fine ethereal medium that pervades all bodies. Others again have supposed, that this subtle matter or ether is itself elastic.

Some resolve elasticity into the pressure of the atmosphere; for a violent collision or compression, though not great enough to separate the constituent particles of bodies, far enough to let in any foreign matter, must yet occasion many little vacuities between the separated surfaces; so that upon the removal of the force they will close again, by the pressure of the aerial fluid upon the external parts. Others make the elastic force of the air included within the pores of all bodies, the principle of their elasticity; but this hypothesis is contrary to fact; since the elastic force remains in vacuo. Stahlbauch, and others, after him, have ascribed this property to imaginary vortices of matter included within all bodies, whose spherical figure is changed by compression into an oval figure, and whose centrifugal force restores them, together with the parts of bodies to which they belong, to their former state.

Others account for elasticity, from the great law of nature, attraction, or the cause of the cohesion of the parts of solid and firm bodies. Thus, say they, when a hard body is struck or bent, so that the component parts are removed a little from each other, but not quite disjointed, or broke off, or separated so far as to be out of the reach of that attracting force whereby they cohere; they must certainly, on the cessation of the external violence, spring back to their former natural state. But it has been objected to this hypothesis, that when, e. g. a spring is bent, the particles on the convex side will be separated from one another, whilst those on the concave will be brought nearer, and the power of attraction, instead of making the spring restore itself, will keep it in the same state, as it happens in bodies that have no elasticity, where perhaps only attraction obtains; and therefore they have supposed the constituent particles of bodies to be endowed with both a repulsive and an attractive power; thus, if a row of round particles touch one another in the point in a line from A to B. *Tab. III. Mechanic. fig. 36.* It is plain, from the laws of cohesion, that upon the least

alteration out of the position of a straight line, these particles will run together, and form a sphere, in which the globules will have more points of contact; and if these particles are supposed to have poles like magnets, in the opposite places marked *a, c, d* that all the poles *a, n, n, &c.* repel one another, and all the poles *a, z, z, &c.* repel one another, the line A-B will continue straight; for if by any force the said line A-B be put into another position, as in the curve *Aa*, then the poles *a, n, n, &c.* being brought nearer together, while the poles *a, z, z, &c.* are farther asunder, will repel one another more strongly, and thereby hinder the globules from running together towards the concave part, and the spring left to itself, one end as *a, B*, or being fixed, will restore itself, throwing its end a back to *A*, and so on to *a*; then, being in the position *aB*, the poles *a, z, z, &c.* are brought nearer together, whilst repulsion, thus increased, throws back *a* to *A*, and so on forward, whilst the line of particles performs several vibrations round *B*. A spring of steel, or other springs, may probably consist of several series of such particles, whose polarity and attraction acting at the same time will show, why such bodies, where they have been bent, vibrate and restore themselves. Hard steel is highly elastic, and the metal is thus hardened by making it white-hot, and immediately quenching it, so that it is fixed in an almost fluid state, and the particles which the fire had made almost round have but a very small contact; and accordingly, steel thus hardened is extremely brittle; but as spherical particles can never make a tough spring, the workmen being down the temper of the hard steel, or let down the spring, as they express it, by a process which alters the figures of its constituent particles. For this purpose they heat it anew, and whilst it is gently cooling, the mutual attraction increases the contact, so that the particles grow flatter in those places where before they had but a small contact; and left the contact should become too great, they quench the spring in water, oil, or grease. Or they have another process, which is to shape them in cold unelastic steel, and then heating them to a small degree, e. g. to a blood-red heat, immediately to cool them in some proper liquor; whereby the particles are settled in their oblong figure before they become round in the fusion of a white heat. Nor is it improbable that they may thus acquire polarity, since dipping red-hot steel in cold liquors in a particular position will make it magnetical; and iron and steel are also made magnetical only with hammering. *Desaguliers' Course of Exper. Phil. vol. ii. p. 38-40, &c. See SPRING.* Perhaps the true cause of the elasticity of bodies may still remain among the unexplored secrets of nature.

ELASTICITY, how it. To enquire a little more expressly into the nature and laws of elasticity, we shall consider the phenomena thereof. Let it be premised, then, that all the bodies wherein this power is observed, do consist, or may be conceived to consist, of small threads or fibres, which, laid together, constitute such bodies. To examine elasticity, therefore, in its most simple case, we had best consider it in mutual fringes or chords, and particularly in those of metal; for those of cast-iron, having a spiral twist, cannot be considered as the fibres whereof bodies are formed.

Now the elasticity of a fibre, or chord, consists in this; that it may be stretched or extended; and that upon removing the force whereby it was stretched or lengthened, it returns again to its form or dimensions. Fibres have no elasticity, unless they be extended with a certain force; as appears in the string, which may be moved a little out of its position without endeavouring to recover it; though whilst the degree of tension is, necessary for elasticity to commence, is not yet determined by experiment; add, that when a fibre is too far stretched, it loses its elasticity; though here, too, the degree of tension that destroys elasticity is unknown; but it is certain, elasticity depends on tension, and is confined within a certain sphere, or boundary thereon, either side. See *SPRING*. This, if it doth not give us the proper adequate cause of elasticity, yet shews us the difference between elastic and unelastic bodies; how it is that a body loses its elasticity, and how a body, destitute of any such force, comes to acquire it. Thus, a plate of metal, by repeated blows of a hammer, becomes elastic; and, being heated again, loses that property.

Between the limits of tension, whereof elasticity is terminated, there are different forces required to give different degrees of tension, in order to stretch chords to certain lengths; what the proportion of these forces is, can only be determined by experiments made with chords of metal; but as the lengthenings of such chords are scarce sensible, the proportions cannot be directly measured; but a particular apparatus, and a kind of circuit, are necessary to arrive thereat. Dr. Gravesande has

taken a good deal of pains, in order to fix these laws, the results of whose experiments are as follow:

1. That a weight, whereby a fibre is increased a certain length, by stretching, is, in different degrees of tension, as the tension itself; if, e. g. there be three fibres of the same kind, length, and thickness, whose tensions are as 1, 2, and 3, any weights, in the same proportion, will stretch them equally.

2. That the least lengthenings of the same fibres are to one another nearly as the forces whereby the fibres are lengthened; which property may likewise be applied to their inflexion.

3. In chords of the same kind and thickness, and which are equally stretched, out of different lengths, the lengthenings produced by superadding equal weights, are to one another as the lengths of the chords; which arises hence, that the chord is lengthened in all its parts; consequently, the lengthening of a whole chord is double the lengthening of half of it, or a chord of half the length.

4. Fibres of the same kind, but of different thicknesses, may be compared together after the like manner; only considering them as consisting of a greater or less number of fine fibres of the same thickness; the number whereof must be taken in the ratio of the solidity of those fibres, i. e. as the squares of the diameters, or as the weights of these fibres, when their lengths are equal; such fibres, of consequence, will be equally stretched by forces that are in the same ratio of the squares of the diameters; which same ratio is likewise required between the forces whereby the chords are inflected, that the sagitta may be equal in the given fibres.

5. The motion of a stretched fibre agrees with the motion of a body vibrating in a cycloid; and how unequal soever the vibrations are, they are all regularly performed in the same time.

6. In two equal chords, unequally stretched, unequal forces are required to inflect them equally: their motions may be compared to those of two pendulums, describing similar cycloids, by different forces; consequently, the squares of the times of the vibrations of the fibres are to each other inversely as the forces whereby they are equally inflected, or as the weights by which the chords are stretched.

7. The motions of similar chords, equally stretched, but of different lengths, may be compared with that of pendulums after another manner; for as the times of the vibrations are to be considered, the celerities also, whereby the chords are moved, must be considered. Now these celerities are to one another directly as the weights whereby the chords are inflected, and inversely as the quantities of matter in the chords; that is, inversely as their lengths; the celerities, therefore, are in an inverse duplicate ratio of those lengths; that is, they are inversely as the squares of the lengths; and the squares of the times of the vibrations are likewise in the inverse ratio; consequently, the lengths of the chords will be as the times of the vibrations.

Elastic laminæ, or plates, may be considered as congeries, or bundles, of *elastic chords*. When the plate is inflected, some fibres are lengthened; and there are unequal lengthenings in several points of the same plate.

The curve formed by the inflected plate is easily determined, from what has been shown concerning chords; in effect, in the vibrations of such plate or spring, the motion thereof is accelerated, after the same manner as the motion of a chord, and of a pendulum in a cycloid, is accelerated; and the vibrations of such springs are all performed in the same time.

Elastic balls, spheres, &c. may be considered as consisting of several *elastic plates*, or springs; and the introductions, or yieldings inward, of any point thereof, are proportionable to the forces wherewith the body is compressed.

THE ELASTICITY of fluids is accounted for, from their particles being all endued with a centrifugal force; whence Sir Isaac Newton, prop. 23. lib. ii. demonstrates, that particles, which mutually avoid, or fly off, from one another, by such forces as are reciprocally proportional to the distances of their centres, will always compose an *elastic fluid*, whose density shall be proportional to its compression; and, *vice versa*, if any fluid be composed of particles that fly off and avoid one another, and hath its density proportional to its compression; then the centrifugal forces of those particles will be reciprocally as the distances of their centres.

ELASTICITY of the air is the force wherewith that element dilates itself, upon removing the force whereby it was before compressed.

The *elasticity*, or *spring* of the air, was first discovered by Lord Bacon, and farther established by the great Galileo. See *Elasticity of Air*.

Its existence is proved by this experiment; that pneumatick jet, let an extraordinary quantity of air be introduced, by means of a syringe, into a glass or metal ball, till such time as the ball, with this accession of air, weighs considerably more, in the balance, than it did before; upon opening the mouth thereof, the air rushes out, and the ball sinks to its former weight.

From hence we argue, that there is still so much air gone out, as the compressed air which had been crowded in. Air, therefore returns to its former degree of expansion, upon removing the force that compressed, or retained, its expansion; and, consequently, it is endued with an *elastic force*.

It must be added, that as the air is found to rush out, in every situation or direction of the orifice; the *elastic force* of the air acts every way, or in every direction.

The *elasticity of the air* making a considerable article in the new pneumatics, we think here give the principal laws thereof.

1. The *elasticity of the lower air* is equal to the weight of all the upper incumbent air; for the upper air is easily proved to press on the lower.

And the *elasticity of the air* has already been shown equal to the compressing power; whence it follows, that the *elasticity of the air* is equal to the weight of the whole incumbent atmosphere.

Hence as the weight of the upper air, incumbent on the lower, is equal to the weight of a column of water of the same diameter with the column of air, and the altitude of 34 feet; or to a column of mercury 28 inches high; the spring of the lower air is equal to the same column of water, or mercury.

Hence, again, the spring of the air, included in a vessel, &c. is likewise equal to the weight of the whole incumbent atmosphere; consequently, the air, included in a vessel, presses with the same force as the weight of the atmosphere; and therefore the *elasticity* of the included air is able to sustain mercury to the height of twenty-eight inches, and water to the height of thirty-one feet, in an empty tube.

2. The *elastic force* of air compressed, is to that of the same air dilated, reciprocally as the bulk of the dilated air to that of the compressed air.

For the *elasticity of air* more compressed, is to that of air less compressed, as the weight incumbent on that to the weight incumbent on this; but the bulks of more and less compressed air are in the same reciprocal ratio of these weights; therefore the *elastic force*, &c.

Hence the *elasticity of air* more compressed, is stronger than that of air less compressed.

3. The *elasticity of more compressed air*, is to that of air less compressed, *ceteris paribus*, as the mass, or quantity, of more compressed air is to a mass of air less compressed of the same bulk.

4. The ratio of the force filled by air pressed only by the weight of the atmosphere, to the space it is reduced into by farther compression, being given; to determine the *elastic force* of the compressed air.

Since the spring of the air, pressed only by the weight of the atmosphere, is equal to the weight of a column of mercury, of the same base with the column of air, and of the height of twenty-eight inches; to the bulk of the compressed air, that of the air not compressed, and the weight of the column of mercury, seek a fourth proportional; this will express the quantity of the *elastic force* in the compressed air.

Hence subtracting the weight of the column of mercury from the quantity of the *elastic force* thus determined, the remainder is the force of *elasticity* whereby it exceeds the resistance of the weight of the atmosphere.

5. Heat increases the *elasticity* of the air, and cold diminishes it. See HEAT, and COLD.

6. The *elastic force* of the air, whereby it is expanded, in rarefaction, is to the *elasticity* of the air condensed, as the bulk of rarefied air, to the bulk of condensed air.

ELATE, in Botany, a genus of the class of *palmæ*. They have male and female flowers, whose calyx is not ascertain'd; the corolla in each has three petals; the male has three lamina; the female a single pistil; the fruit is an oval acuminate drupe.

Elate, is also used, by some authors, for a genus of plants called by Linnaeus *phloxæ*, and, in the *Hortus Malabaricus*, *ratichind*. See PHLOXES.

This word was also used by the ancients to express the fir-tree; and likewise in other senses.

ELATER, the name of a genus of the *culestera* order of insects, with setaceous antennæ; which, when laid on their backs, have a power of leaping with great force and agility. There are various species of these four-winged flies, distinguished by their different colours.

ELATERIUM, in Botany, a genus of the *menispermæ* natural class. This genus hath male and female flowers in the

the same plant; neither have any calyx; the corolla in both is hypocrateriform, or funnel-shaped; the capsule is single-celled, with two valves. Miller makes the *Elaterium* of Boerhaave, or the wild cucumber, a species of the *nummularia*. See *Male Balsam Apple*.

ELATERIUM, ELATERIUM, In *Pharmacy*, a violently purgative medicine, prepared from the wild cucumber. See *Male Balsam Apple*.

The word is formed from the Greek *ελατερν*, *Elater*, *agitatus*, &c.

Elaterium is made of the juice of the fruit, forced out with the finger; this, suffered to stand some time, less fall a sediment, which, carefully dried on chalk-stones, is the *elaterium*.

Elaterium is a vigorous purge, and is sometimes used in lachryes, palics, and hypochondriacal melancholies.

ELATINE, in the Linnæan system of *Botany*, is a distinct genus of plants of the *dicotyledonous* class; the characters of which are, that it has a four-leaved calyx, four petals, a four-celled depressed capsule, with four valves. There are two species.

ELATINE, Floating, or Female Speedwell, is, in Linnæus's distribution, a species of the *ANTHRINUM*; under which genus he has also classed the *tinaria*. Miller makes the *elatine* a species of the *linguis*, or *trifolium*. This is a low procumbent plant, with oval, acuminate, downy leaves, set alternately on the stalks. It is annual, grows wild in corn-fields, and flowers in July.

ELATINE, in *Medicine*, is greatly recommended as an aperient, resolvent, and vulnerary. Its simple water has been used for the same purposes, though it retains very little of the virtues of the plant. The infusion is much better, and the extracted juice preferable still. It is praised by some in leprosy and scrophulous cases; also externally for cancerous and other eating ulcers. An ointment is made of it for these purposes. At present, however, it is very little used.

A combination of its active matter with honey, prepared by boiling four pints of the deputed juice with four pounds of clarified honey, is sometimes kept in the shops.

ELATITES, fir-trees, in *Natural History*, a name given by authors to that sort of petrified wood which shows the lineaments of the fir-tree wood, and has been originally either that or some wood of a like kind.

ELATITES was also a name used by the ancients for an iron ore, esteemed a species of hematites; it was of a yellowish white colour, and was more usually called *XANTHUS*.

ELAWANDUM, in *Zoology*, the name of a remarkable species of monkey, common in the island of Ceylon; its hair is whitish, or of a pale grey, and it has a long and beautiful black beard hanging from its chin. Ray's Syn. Quad. p. 488.

ELBOW, the outer angle made by the flexure, or bend of the arm.

That eminence whereon the arm rests, called by us *elbow*, is by the Latins called *cubitus*, and the Greeks *αγκυον*, and by others *αγκυον*.

Elbow is also used by architects, masons, &c. for an obtuse angle of a wall, building, or road, which directs it from its right line.

ELCESAITES, HELLICSAITES, or ELCESAITES, as Theodoret calls them, ancient heretics, thus denominated from their great prophet *Elia*.

This *Elia*, by others called *Elai*, who lived in the time of Trajan, gave into the sentiments of the Ebionites, teaching Jesus Christ, though he altered and reformed them in some things, to deify himself the author of a sect.

His fundamental doctrines were, that Jesus Christ, who was born from the beginning of the world, had appeared from time to time under divers bodies; that he was a celestial power, or virtue, called the *Christ*, whereof the Holy Spirit was fuller (note the Hebrew word for spirit is feminine); and that both of them had descended into Jesus, the son of Mary, who was clothed with a corporeal appearance, but not with a real body.

The *Elcesaites*, according to St. Epiphanius, were by some also called *Sampsans*, from the Hebrew word *sams*, *sun*. Scalliger was notoriously mistaken, in holding that *Elia* was no more than *Elia*, or *Elia*; on which supposition he made the *Elcesaites* the same with the sect of *Elenses*, which is contrary to all antiquity.

Origin makes mention of the *Elcesaites*, in one of his homilies as a heresy newly risen. The retainers hereto, says he, do not admit all the books of the canon, but only some of them: they allow some passages out of the Old Testament and the Evangelists, but reject all the Epistles of St. Paul. Add, that they have produced a book, which they pretend descended to them from heaven; and maintain, that whoever perform what is enjoined

Vol. II. N° 109.

therein, shall obtain pardon of all their sins. See Eusebius, Hist. lib. vi. cap. 38. who remarks, that this heresy became extinct almost as soon as it arose.

St. Epiphanius is very full on the subject of this sect. Her. 10. where he observes that Elai was a Jew by birth; and that not being able to live according to the law of Moses, he invented new opinions, and gained followers. He was a professed enemy of virginity, and obliged all, who followed his doctrine, to marry. He tutored them to hypocrisy in times of persecution, pretending it was lawful to adore idols, provided the heart had no share therein.

Some have doubted, whether the *Elcesaites* should be reckoned among the Christian or Jewish sects; for though they acknowledged Christ as a great king, it is not certain whether they meant Jesus Christ, or some other pretended Messiah.

ELDER, a word used in some parts of the kingdom for fuel. Dist. Rust.

ELDER-tree, Sambucus, in *Botany*, a genus of the *pentandria caryophylla* class. Its characters are these: the flower has a small permanent empanement of one leaf, cut into five parts; it hath one concave, wheel-shaped petal, cut into five obtuse segments at the brim, which are reflexed; and five awl-shaped stamens, of the length of the petal, terminated by roundish summits, with an oval germ situated under the flower, having no style, in room of which is a swelling gland, crowned by three obtuse stigmas; the germen afterward becomes a roundish berry, with one cell, including three angular seeds. Linnæus enumerates four, and Miller five species.

The common *elder* is too well known to need a description. Of this there are the following varieties, viz. the white and green-berried *elder*, and the variegated-leaved *elder*. For the medical virtues of that species, called the *dwarf elder*, see *ELULUS*.

The common *elder* will grow on any soil, or in any situation; the trees are frequently seen growing out of old walls, or close to ditches, in very moist places, or from the hollow of another tree; for wherever the seeds are scattered, the plants will come up. The leaves and stalks are so bitter and nauseous, that few animals will browse upon them.

The young shoots of this tree are very full of pith; but as the trees grow old, the wood becomes very hard, and will polish almost as well as the box-tree; and is often used for the same purpose.

The bark, leaves, flowers, and berries of this tree, are used in medicine. The inner bark is esteemed good for dropsies. Sydenham directs three handfuls of the inner bark to be boiled in a quart of milk and water, till only a pint remains, of which one half is to be taken in the morning, and the other at night; and this repeated every day. Boerhaave recommends the expressed juice of the middle bark, given from a dram to half an ounce, as the best of hydragogues, when the viscera are sound. The leaves, which are said to be purgative and emetic, are outwardly used for the piles and inflammations. The flowers are inwardly used to expel wind; infusions made from them while fresh are gently laxative and aperient; when dry, they are said to promote the cuticular excretion, and to be particularly serviceable in cystitis and eruptive disorders; and the berries are esteemed cordial, and useful in hysterical disorders, and are frequently put into gargarisms for sore mouths and throats. Miller and Lewis.

Official preparations of the *elder*, are the *apex ferens sambuci*, the *oleum sambucinum*, the *unguentum sambucinum*, made of the leaves and inner bark, and also of the flowers, and the *symplicium sambuci*.

On the trunk of this tree frequently grows a fungus excrescence, wrinkled, and turned up like an ear, whitish on the outside, and black within, with several little veins. These are called *Jew's ears*, *auricula Judæorum*; they are accounted good for inflammations and swellings of the tonsils, sore throats, and quinies.

ELDER, marsh, or water. See *WAYFARING-tree*.

ELDER, Spanish. See *LIZARD's Tail*.

ELDERS, seniors, in the Jewish Church, were the most considerable persons, for age, experience, and virtue, among that ancient people. Moses, we read, assembled the *elders* of the people together, and acquainted them with what the Lord had commanded.

Long afterwards, those who held the first rank in the synagogues were usually called *ἡγούμενοι, ἡγούμενοι, elders*, in imitation of the seventy *elders*, whom Moses established for the judges of the Sanhedrim. Numbers xi. 16, 17, 24, 25. Exod. xxiv. 1, 9, 14. See *SANHEDRIM*.

The president, or chief, had, in a particular manner, the appellation of *elder*; being, as it were, the *decanus seniorum*, *dean* of the *elders*.

In the assemblies of the primitive Christians, these who

held the first place, or rank, assumed the denomination of presbyters, or *elders*: for the word *presbyter*, which occurs so frequently in the Old Testament, and which includes alike both bishops and priests, does properly signify *elder*. See M. Simon's observation thereon, in his Supplement aux Cereémonies des Juifs.

The president, or bishop, as being the chief of the *elders*, did likewise assume the denomination of *elder*: whence it is, that in the New Testament the name *bishop* is frequently confounded with that of *presbyter*. See BISHOP, and PRESBYTER.

For the like reason, the council of the first churches was called *presbyterium*, or council of the *elders*, where the bishop presided in quality of first *elder*, being seated in the middle of the other *elders*. The priests, or *elders*, who sat by him, had each his judge's chair, for which reason they are called, by the fathers, *episcopii cathedram*. Nothing of any importance was done till it had first been examined, and resolved, in this assembly, where the bishop only made one body with the other *elders*, or priests; the jurisdiction which we now call episcopal, not being then dependent on the bishop alone, but on all the *elders*, over whom he was only the president.

ELDERS is also a denomination still retained in the presbyterian discipline.

The *elders* are officers, who, in conjunction with the pastors, or ministers, and deacons, compose the consistory, or Kirk-sessions, meeting to consider, inspect, and regulate matters of religion and discipline. They are chosen from among the people, and are received publicly with some degree of ceremony. In Scotland, there is an indefinite number of *elders* in each parish; generally about twelve. See KIRK-Sessions, and PARISHES.

ELDIENIE, in *Ichthyology*, a name by which some call the small fish, known in English by the name of the MINNOW, and called by authors *varius*, from the various colour of its sides and belly.

ELIATIC philosophy, among the *Academics*, a name given to that of the *Stoics*, because taught at *Eliæ*, in Latin Vellei, a town of the Latins.

The founder of this philosophy, or of the *Eliatic sect*, is supposed to have been *Xenophanes*, who lived about the fifty-fifth Olympiad, or between five and six hundred years before Christ. This sect was divided into two parties, which may be distinguished metaphysically and physically, the one rejecting, and the other approving, the appeal to fact and experiment. Of the former kind were *Xenophanes*, *Parmenides*, *Melissus*, and *Zeno*, of *Eliæ*. They are supposed to have maintained principles not very unlike those of *Spinoza*; they held the eternity and immutability of the world; that whatever existed was only one being; that there was neither any generation nor corruption; that this one being was immovable and immutable, and was the true God; and whatever changes seemed to happen in the universe, they considered as mere appearances and illusions of sense. However, some learned men have supposed, that *Xenophanes* and his followers, speaking metaphysically, understood by the universe, or the one being, not the material world, but the originating principle of all things, or the true God, whom they expressly affirm to be incorporeal. Thus *Simplicius* represents them as merely metaphysical writers, who distinguished between things natural and supernatural; and who made the former to be compounded of different principles. Accordingly, *Xenophanes* maintained, that the earth consisted of air and fire, that all things were produced out of the earth, and the sun and stars out of clouds, and that there were four elements. *Parmenides* also distinguished between the doctrine concerning metaphysical objects, called *trials*, and that concerning physical or corporeal things, called *opinions*; with respect to the former, there was one immutable principle, but in the latter two that were movable, viz. fire and earth, or heat and cold; in which particular *Zeno* agreed with him. The other branch of the *Eliatic sect* were the atomic philosophers, who founded their system from their attention to the phenomena of nature; of these the most considerable were *Leucippus*, *Democritus*, and *Protagoras*. See EPICUREANS, and STOICS. See a further account of the opinions of these ancient philosophers, in Colwell's Intellectual System.

ELECAMPANE, *Isula*, in *Botany*, a genus of the *Jugosa*, or *polygamia superflua* class. Its characters are these: it has a radiated compound flower, with an imbricated empanement; the disk or middle of the flower is composed of hexapetaloid flowers; the border or ray of female half-flowers branched out like a tongue. The hermaphrodite flowers are funnel-shaped, and cut into five parts at the top; these have five short, slender stamens, which coalesce at the top; and they have only one long germin crowned with down. The female half-flowers have narrow, entire, tongue shaped petals, no stamens,

but a long crowned germin, with a hairy style. The germina in both flowers become a single, narrow, four-cornered seed, crowned with a down, sitting on a naked receptacle. *Linnaeus* enumerates twenty-four, and *Müller* fifteen species; the first of which grows naturally in several parts of England; but is cultivated in gardens for the sake of the roots. *Müller*.

Tournefort joins most species of this genus to the *after*, or *faravert*. Ray classifies it under the *hemium*.

The root of the *isula*, or *elecampans*, has been long famous in all disorders of the breast and lungs. It is also recommended as a sudorific and alexipharmic, and as such, has a place in most of the compositions of that intention. Taken freely, it is said to gently loosen the belly, and increase the urinary discharge. The dose of the dry root in substance is from a scruple to a dram, or two. An ointment made of the fresh roots and leaves with lard is also much recommended in the itch, and other cutaneous foulnesses. The roots yield in distillation an essential oil, which concretes into white scales, resembling camphir in many of its properties, and soluble in spirit of wine. An extract may also be obtained from the dry root, both by water and spirit; an ounce yielding by way of dram, and by spirit 2j.

ELECAMPANE *arg.* See *WINE*.

ELECT, from *elect*, *I elect, eligo*, in the *Scripture*, is applied to the primitive Christians, in which sense, the *elect* are those chosen and admitted to the favour and blessing of Christianity.

ELECT, in some systems of *Theology*, is a term appropriated to the saints, or the predestinated. In which sense the *elect* are those persons who are said to be predestinated to glory at the end, and to justification as the means. See ELECTION and PREDESTINATION, ARMINIANS, CALVINISTS, &c.

ELECT is likewise applied to archbishops, bishops, and other officers, who are chosen, but not yet consecrated, or actually invested with their office, or jurisdiction. The emperor is said to be *elect*, before he is inaugurated and crowned; a lord-mayor is *elect* before his predecessor's mayoralty is expired, or the sword is put in his hands.

ELECTARY, in *Pharmacy*. See *ELECTARY*.

ELECT, in *Church History*, a sort of heretic, who neither eat flesh nor married. See ANASTAS.

ELECTION, a choice made of anything, or person, where by it is preferred to some other.

There seems this difference, however, between *elect* and *electio*, that *electio* has usually regard to a company or community, which makes the choice; whereas choice is seldom used, but when a single person makes it.

We say, the *election* of a bishop, a member of parliament, &c. See BISHOP, PARLIAMENT, &c.

The most solemn *electio* is that of a pope, which is performed by the cardinals in four different ways. The first by the Holy Spirit, as they call it: when the first cardinal who speaks, having given his vote for any person, proceeds to the acclamation, and proclaims him pope, as by a sudden inspiration of the Holy Ghost. In which case he is deemed duly *elect*, if all, or at least two-thirds of the assembly be consenting thereto.

The second, by compromise, when the whole college pitches on three cardinals, to whom they give a power of nominating the pope; which power expires upon the burning out of a candle lighted on that occasion.

The third by way of poll or scrutiny, which last is the most usual; the cardinals throwing sealed tickets, wherein their votes are written, into a chalice, or cup, placed on the altar. Two thirds of the votes are required to determine an *electio* by scrutiny.

The fourth is by way of acclamation; when the votes being too much divided to admit any body, some of the cardinals desert from their fixed allegiance, and decide, that is, give their votes to him, who has already the majority by scrutiny.

The way of acclamation, however, is always added to the scrutiny; it being the constant practice for all the cardinals to give their votes, after the last scrutiny, to him whom they find to have the plurality already. So that all *electio* of popes are with the unanimous consent of all the cardinals. See CARDINALS, CONCLAVE, and POPE.

ELECTION of numbers, or quantities, in *Arithmetic* and *Algebra*, denotes the different method of taking any numbers or quantities given, either separately, or in pairs. &c. or it is the sum of all the combinations that can be made with a different number of quantities, in each set of combinations, out of any number of quantities proposed. Thus, the *election* of 3 quantities *a, b, c*, is 2^3 or $2 \times 2 \times 2$, *election* of 4 quantities 15 ; and if N represent the number of quantities given, $2^N - 1$ is equal to the number of *election* required: but as the *election*

gle quantities are equal in number to the given quantities, the number of proper *electors* will be $2^N - N - 1$.

See COMBINATION.

ELECTION of a clerk of statutes merchant, in Law, a writ that lies for the choice of a clerk assigned to take statutes merchant. It is granted out of chancery, on suggestion that the clerk, formerly assigned, is gone to dwell at some other place, or is under an impediment to attend the duty of his office, or that he has not had sufficient to answer his transgressions, if he should act amiss. *Fitz. Herb. Nat. Brev.* 164.

ELECTION of ecclesiastical preferment. *Electum* for the dignities of the church ought to be free, according to the stat. 9 Ed. II. cap. 14. If any persons, that have a voice in *electum*, take any reward for an *electum* in any church, college, school, &c. the *electum* shall be void. And if any persons of such societies resign their places to others for reward, they incur a forfeiture of double the sum; and both the parties are rendered incapable of the place. Stat. 31 Ed. II. cap. 6.

ELECTION of a vicar of the single, (electum vicarium singulare) in Law, a writ that lies for the choice of a vicar, where any of the vicars of the church are dead, or removed from their office. This writ is directed to the sheriff, and the vicar is to be elected by the freeholders of the tithing, in the same manner as cotenants. *New Nat. Brev.* 366.

ELECTION is also the fate of a person who is left to his own free will, to take or do either one thing, or another, which he pleases. See LIBERTY.

ELECTION, in Theology, signifies the choice which God, of his good pleasure, makes of angels or men, for the objects of mercy and grace.

The *electum* of the Jews, was the choice God made of that people to be more immediately attached to his worship and service, and for the Messiah to be born of them. And thus particular nations were *electum* to the participation of the outward blessings of Christianity.

ELECTION also, in the language of some divines, signifies a PREDESTINATION to grace and glory, and sometimes to glory only. And it has been enjoined as an article of faith, that predestination to grace is gratuitous, merely and simply *gratis, quia gratis data*. But the divines are much divided as to the point, whether *electum* to glory be gratuitous, or whether it opposes obedience and good works, i. e. whether it be before, or after, the provision of our obedience. See GRACE and REPROBATION.

ELECTION is also used for a part of Pharmacy: being that which teaches how to chuse the medicinal simples, drugs, &c. and to distinguish the good from the bad.

Some distinguish a general *electum*, which gives the rules and marks for all medicine in general; and a particular one for each medicine in particular. Pomet, in his History of Drugs, gives very good rules for this *electum*.

ELECTIVE, something that is done, or passes, by election. See ELECTION.

Some benefices are *elective*, others collative. Municipal offices in England are generally *elective*; in Spain, venal. Poland is an *elective* kingdom. All prelatures in France are *elective*, since the Concordat.

ELECTIVE attraction, in Chymistry. See AFFINITY.

ELECTOR, a person who has a right to *elect*, or choose another to an office, honour, &c.

The word is formed of the Latin *electus*, to *elect*.

We say the *electors* of a burgess, a knight of the shire, a grand master of an order, &c.

ELECTOR is particularly, and by way of eminence, applied to certain princes of Germany, in whom lies the right of electing the emperor, being all sovereigns, and the principal members of the empire.

The origin of *electors* is not well known: some refer it to an edict of Otto III. confirmed by Gregory V. about the year 966. But this opinion is contradicted by the whole tenor of history. From the earliest period in the history of Germany, the person who was to reign over all, was elected by the suffrage of all. Thus, Conrad I. was elected by all the princes and chief men, or by the whole nation; in 1204, Conrad II. was elected by all the chief men; and his election was approved and confirmed by the people; and at the election of Lotharius II. in 1175, fifty thousand persons of all ranks were present, and he was named by the chief men, whose nomination was approved by the people. Others refer it to Frederic II. who died in 1250.

The first author who mentions the seven electors is Martinus Polonus, in this reign; and this restrictive privilege was probably obtained by degrees. The princes of greater authority were first allowed to name the person whom they wished to be chosen emperor, and the people retained the right of approving or disapproving the wo-

mination; and when they had secured the right of voting first, or of *præsentationem*, as it was called, it became needless for the inferior ecclesiastics or barons to attend, merely to confirm their choice; more especially as their attendance would become troublesome and expensive. Besides, the assumed privilege of the seven electors, who possessed the most extensive territories, was strongly supported by their numerous dependents and allies; and they were considered as the representatives of all the orders which composed the highest class of German nobility. See Robertson's Hist. chap. v. vol. i. p. 455, &c. 8vo. edit.

Others have ascribed the origin of *electors* to Ralph of Hapthburgh founder of the House of Austria, in the year 1185.

It appears from the above account that their number was unsettled, at least till the time of Frederic II. in the thirteenth century. The golden bull, published by Charles IV. in 1356, fixed the number of *electors* to seven; three of them ecclesiastics, viz. the archbishops of Mentz, Treves, and Cologne; and four seculars, viz. the king of Bohemia, the count palatine of the Rhine, the duke of Saxony, and the margrave of Brandenburg. By the treaty of Munster, in 1648, this order was changed; the duke of Bavaria being put in the place of the count palatine, and an eighth electorate erected for the count palatine.

In the year 1690, a ninth electorate was created by the emperor Leopold, in favour of Elector of Hanover, under the title of elector of Brunswick. Some opposition was made to this election; and the princes of Germany stood out for some time, and refused to acknowledge it. But they afterwards acquiesced in it, and it has been since recognized by all the foreign princes. The king of France did it at last by the treaty of Rastatt.

The *electors* have not only the power of choosing the emperor, but they have actually exercised that of deposing him. Thus they deposed Adolphus of Nassau in 1298, and Wenceslaus in 1400.

The several functions of the *electors* are as follow: the *elector* of Mentz is chancellor of Germany; he convokes the states, and gives his vote before any of the rest. The *elector* of Cologne is grand chancellor of Italy, and consecrates the emperor. The *elector* of Treves is grand chancellor of the Gauls, and confers the imposition of hands on the emperor. The count palatine of the Rhine is grand master of the imperial palace, and presents the emperor with a globe at his coronation. The margrave of Brandenburg is grand chamberlain, and puts the ring on the emperor's finger. The duke of Saxony is grand marshal, and gives the sword to the emperor. The king of Bohemia, who was anciently only duke, is grand butler, and puts Charlemagne's crown on the emperor's head. Lastly, the *elector* of Hanover, now king of Great Britain, is arch-treasurer; though first created under the title of standard-bearer of the empire.

The *electoral* prince is the eldest son of an *elector*, and the presumptive heir of his dignity.

Electors are always addressed under the title of *electoral highness*.

The *electoral* college, consisting of all the *electors* of the empire, is the most illustrious and august body in Europe. See DIET.

ELECTORS of members of parliament. See BURGESS, and PARLIAMENT.

ELECTORAL crown, or coronet. See CROWN.

ELECTORATE, the dignity of an elector, with the territory, or dominions, to which that quality is annexed. See ELECTION.

Though the custom ordinarily be, in Germany, for the sons of princes to share their fathers' lands and territories among them, those wherein the *electorate* is annexed, are not used to be divided, but pass entire to the eldest son who succeeds to the *electorate*.

ELECTRIC, derived from *electrum*, amber, in Physics, is a term applied to those substances, in which the *electric* fluid is capable of being excited, and accumulated, without transmitting it, and therefore called *non-conductors*, in opposition to *conductors*, under which article the reason of the terms, and the difference between *electric* and conducting substances, are particularly explained. These are also called *electricæ per se*, and original *electricæ*. To this class belong glass, and all vitrifications, even of metals; all precious stones, of which the most transparent are the best; all resins, and resinous compositions; amber, sulphur, baked wood, all bituminous substances, wax, silk, cotton, all dry animal substances, as feathers, wool, hairs, &c. paper, white sugar, and sugar-candy, air; the vapour of water, when examined in a degree of heat, in which it is capable of condensing into water, and also that of quicksilver, as Dr. Priestley has very lately found (*Obs. on Air*, &c. 1779. p. 426); ice froze to the

13th degree below 0 of Fahrenheit's scale, and produced from distilled water, as has been lately discovered by Mr. Achard of Berlin; *oil*, *chocolate*, *calces of metals* and *semi-metals*, the *ashes of animal and vegetable substances*, the *ruff of metals*, all dry vegetable substances, and all hard stones, of which the best are the hardest. Substances of this kind are capable of being excited, so as to exhibit the electrical appearances of attracting and repelling light bodies, emitting a spark of light attended with a snapping noise, and yielding a current of air, the sensation of which resembles that of a spider's web drawn over the face, or any part of the body presented to it, and a smell like that of phosphorus, either by friction, or by heating and cooling, or by melting, and pouring one melted substance into another. The first is the most usual method of exciting *electricity*; the effect of the second was first observed with regard to the *rotaxmas*, and has been since found to extend to many other similar substances; and several particular circumstances have been found to attend the operation of melting sulphur, wax, &c. according to the nature of the vessels in which they are dissolved, and of the substances with which they are in contact, when left to cool.

Whenever an *electric* is excited by friction, it is necessary that the substance with which it is rubbed, called the *rubber*, should communicate with the earth or with bodies abounding with electricity, by means of good conductors; for if the rubber be insulated, i.e. if its communication with the earth be intercepted by *electricity*, the effect of friction will be inconsiderable, and the electrical power excited by it be very weak. An *electric* will not part with the power excited by friction, by bringing other *electric* substances into contact with it; and, therefore, a glass tube, or globe, surrounded by the air, which is an *electric*, retains its virtue for some time; but as the air is never a perfect *electric*, it will gradually lose it, by communication to the moisture, and other conducting particles, that float in this element. An insulated conductor may also receive the electrical power, communicated to it by the approach of excited *electricity*, will then exhibit similar appearances, and retain it in the same manner. But if any other conductor, communicating with the earth, be brought into contact with it, the electrical power will be conveyed away at once; whereas an excited *electric*, being itself a non-conductor, will lose only part of the power which it possesses from that portion of the surface, to which the conductor is immediately presented, and thus the whole is exhausted by degrees; and, therefore, the spark of fire is not so dense, nor the explosion so loud from excited, as from communicated *electricity*.

No *electric* can be excited, without producing electrical appearances in the substance by which it is excited, provided that substance be insulated; but the electrical powers of the excited *electric*, and of the insulated rubber, are directly the reverse of each other, and may be easily distinguished, by their exhibiting opposite effects. Thus, if a small ball of cork be suspended by a silken thread, and presented to the *electric*, it will be first attracted, and then repelled; but in this state of repulsion from the *electric*, it will be more violently attracted by the rubber, than by any other conducting substance, and *vice versa*. And if two such insulated balls of cork be presented either to the *electric* or rubber separately, they will repel each other; but if one of these balls be presented to the *electric*, and the other to the rubber, and they be then brought within a sufficient distance, they will mutually attract each other, and their electricity will be discharged: they have evidently the same effect of counterbalancing and destroying each other, as positive and negative quantities in algebra; and it has been observed, that two pieces of glass, or silk, possessed of these contrary electricities, will cohere together, and require a considerable force to separate them. Besides, these opposite powers may be distinguished by presenting any pointed conductor to the *electric*, supposed to be glass, and to the rubber of the common leather kind, in the dark; the light issuing from the *electric* to the point will appear like a star upon it; but the light issuing from the point to the rubber will be a lucid pencil or brush, diverging from the point towards the rubber. See *BRUUS*, *LUMINOUS CONDUCTOR*, and *STAR*.

We may also add, that a current of air may be perceived passing from these points, in both cases, in opposite directions.

Most *electric* may be made to acquire either of these electricities at pleasure, by using proper rubbers; but as the former of them was first discovered by rubbing glass, it was called the *vitreous*, and the latter, produced by resinous substances, as amber, sealing-wax, sulphur, &c. was called the *resinous electricity*. However, electricians,

afterwards concluding that excited glass acquired more than its natural quantity of the *electric* fluid by friction, and that excited wax or sulphur, or the insulated rubber, lost part of it, called the former *positive*, and the latter *negative electricity*; terms which are now generally used, and justified by the principal phenomena of this science. See *Theory of ELECTRICITY*.

The following table will shew what kind of electricity is excited in different bodies, when rubbed with different substances.

Back of a cat	Positive	Every substance with which it has been hitherto tried.
Smooth glass	Positive	Every substance hitherto tried, except the back of a cat.
	Positive	Dry oiled silk, sulphur, metals.
Rough glass	Negative	Woollen cloth, quills, wood, paper, sealing-wax, white wax, the human hand.
	Positive	Amber, air.
Tourmalin	Negative	Diamond, the human hand.
	Positive	Metals, silk, load-stone, leather, hand, paper, baked wood.
Hare's skin	Negative	Other fine furs.
	Positive	Black silk, metals, black cloth.
White silk	Negative	Paper, hand, hairs, weasel's skin.
	Positive	Sealing-wax.
Black silk	Negative	Hare's, weasel's, and ferret's skin, load-stone, brass, silver, iron, hand.
	Positive	Metals.
Sealing-wax	Negative	Hare's, weasel's, and ferret's skin, hand, leather, woollen cloth, paper.
	Positive	Silk.
Baked wood	Negative	Flannel.

Cavalle's Electricity, p. 17.

See a larger catalogue of this kind, in which the rubbers were woollen garments, and silk, by Mr. Henly, in the *Phil. Trans.* vol. lxviii. part 1. p. 122, &c.

It may be observed in general, that when different substances are rubbed together, the substance, whose electrical power is the strongest, acquires the positive, and the other the negative electricity; and when two bodies, differing in the smoothness or roughness of their surfaces, are rubbed together, the smoothest, which requires the least friction, acquires the positive; and the roughest, the negative electricity. We may also observe, that, if an unimpaired conductor be brought within the atmosphere, or sphere of action, of an excited *electric*, or an electrical body, it will acquire on the side exhibited to the *electric*, an electricity opposite to that of the electrified body; which increases the nearer it approaches, till at last the conductor receives a spark from the *electric*, and the equilibrium is restored. But if the conductor be insulated, both its sides will in the access appear to be electrified; that next to the *electric* acquiring an electricity opposite to that of the *electric* itself, and the remoter side possessing the same kind of electricity with the *electric*; and when the discharge is made, the electrical power of the insulated conductor, and of the *electric*, are of the same kind.

If an *electric* be brought near to an electrified body, the circumstances will be the same during the approach of one to the other; however, when the *electric* has received a small quantity of electricity from the electrified body, it will still, in some cases, exhibit strong electricities on different sides, and repeated changes may sometimes be observed from positive to negative electricity in the same *electric*; a phenomenon, which is explained by the non-conducting quality of an *electric*, and the disposition which bodies have to acquire an electricity contrary to that of another contiguous electrified body. See *Electrical ATMOSPHERE*.

ELECTRIC, charging and coating of. See *CHARGE*, and *COATING*.

ELECTRICAL air thermometer, is an instrument contrived by Mr. Kinnerly of Philadelphia, and used in determining the effects of the electrical explosion upon air. This instrument consists of a glass tube AB (*Tab. II. Electricity*, fig. 15.) about eleven inches long, and one inch in diameter, closed, air-tight, with brass caps, C and D, which may be screwed on or taken off at pleasure; and of a small glass tube, K, open at both ends, cemented into the brass tube, L, which screws into the upper part, C. The upper end of this tube has a brass ferrule with an air-hole, *a*, and the lower end is immersed in colored water at the bottom of the tube AB. Within this tube, AB,

AB, are fixed two wires, F and G; the wire F descends from a brass cap at the upper end, and the wire G passes through the lower cap into the pedestal E, to which the vessel, A B, is fixed by means of a male screw, D, that goes into a brass nut at E; and this wire may be raised or lowered at pleasure, by means of a male screw annexed to it, in order to produce a discharge from F to G. The wire, E, is a small round ferris, encompassing the tube K, and when air is blown into this tube, so as to raise the coloured water up to e, the gas-wire, e, is brought down to the top of the column, and the *thermometer* is ready for use. It is evident from the construction of this instrument, that, when the air within the tube AB is rarefied, the water will rise in the small tube, and the degree of its ascent will measure the degree of rarefaction. When the wires F and G are in contact, a large charge of electricity, from above thirty square feet of coated glass, produces no rarefaction in the air; the water in the small tube not being at all moved from the gas-wire; and therefore the passage of the *electric fluid* through conductors sufficiently large, neither rarefies nor displaces the air about them. But when the wires are about two inches asunder, the same charge raises the water to the top of the small tube; and a charge from a glass jar, containing about five gallons and a half, raises it to d, which fuldenfies is owing to a quantity of air actually displaced by the *electric fluid*. When the air condenses, the water in the tube subsides, till it is in equilibrium with the rarefied air; and then gradually descends, as the air cools, and settles at its former height. By generally observing at what height above the gas-wire e, the descending column of water last stopped, Mr. Knauss discovered the degree of rarefaction produced by the *electric explosion*. Franklin's Letters, &c. in 3d vol. sec. 4to, 1769.

ELECTRICAL apparatus consists of glass tubes, about three feet long, and an inch and a half in diameter, one of which should be sealed at one end, and furnished at the other end with a brass cap, and stop cock, in order to rarefy, or condense, the enclosed air; a piece of sealing-wax, or tubes of rough glass, or glass tubes covered with sealing-wax, or cylinders of baked wood, for producing the negative electricity; with proper rubbers, as black oiled silk, with AMALGAM upon it for the former; and soft, new flannels, or hare skins, or cat's skins, tanned with the hair on, for the latter; coated jars, or plates of glass, either single, or combined in a battery, for accumulating electricity; metal rods, as dischargers; an electrical machine; electrometers, and insulating stools, supported by pillars of glass, covered with sealing-wax, or baked wood, varnished or boiled in linseed oil. See these more particularly described under the articles *Electric Battery*, *Conductors*, *Dischargers*, *Electrical Machine*, *Electrometer*, &c. Signor Beccaria contrived a substitute for glass, which is an expensive article in the apparatus of an electrician, by mixing equal quantities of very pure colophonium, and finely pulverized marble, well dried, melting the mixture, and then spreading it on a piece of tin-foil, two or three inches beyond the edge of it, about one tenth of an inch thick; over this he laid another piece of tin-foil within about two inches of the edge of the mixture; and this coated plate served him instead of a plate of glass, possessed a greater power, retained it longer, was less liable to break, and easily repaired.

ELECTRICAL atmosphere. See ATMOSPHERE.

ELECTRICAL attraction and repulsion. See Experiments and Phenomena in ELECTRICITY and ELECTRIC.

ELECTRICAL balls. See BALLS and ELECTRIC.

ELECTRIC battery. See BATTERY, where the method of constructing a battery is described.

In cases which require a great force of electricity, batteries are commonly used; but experiments of this kind should be conducted with great care and caution. Metallic wires of a small diameter may be made red-hot and melted by the explosion of a battery; and the red-hot particles of the metal are scattered by the explosion in all directions; but if the force be very great, the wire will be entirely dispersed. If the wire be melted on a piece of glass, the glass will be marked by the explosion with all the prismatic colours; and a force which is just sufficient to render a wire, thrashed by weights, red-hot, will considerably lengthen it. A slender wire, enclosed in a glass tube, about a quarter of an inch in diameter, will be reduced, by a moderate discharge of a battery through it, into globules of different sizes, which may be collected from the inner surface of the glass tube; they will be funnel hollow, and to be little else than the mere *coria* of the metal. Mr. Henry, and others, have observed, that in melting wires of some inches in length, the red heat begins at the end in contact with the discharging rod, or with the positive side of the battery, and

proceeds gradually towards the convex of the battery, plainly evincing the direction of the electrical matter in the discharge. The conducting power of metals corresponding to the ease with which they are melted, the same ingenious electrician endeavoured to ascertain this, by causing an explosion to pass through metal wires of different kinds, but of the same diameter, but he was not satisfied with the result of his trials.

Dr. Priestley infers, from some experiments on the conducting power of different metals, that the order in which they are to be ranked, with respect to the power of electricity to melt them, is the following; viz. iron, brass, copper, silver, and gold; however, further experiments are still wanting for the absolute decision of this question. In comparing different explosions by their power to melt wires, it must be observed, that, in wires of some thickness, the forces that melt them will lie in the proportion of their lengths, and in wires of the same length, in the proportion of the squares of their diameters. Mr. Henry, having obtained loose grains of purified platinum, which had received the united force of chemical fire, laid them in contact with each other on a fine drap with a blunt-ended wire over the surface of a plate of white wax, about the length of half an inch, and at each end of the line of platinum, and in contact with it, he placed a thick wire, with its end nicely covered off and made perfectly smooth; and having covered the platinum with a piece of thick plate-glass, and it charged through it three jars, containing sixteen square feet of coated surface, he fused it into several beautiful filaments. Mr. Nairne has since repeated the experiment with equal success. Phil. Trans. vol. lxxv. part ii. art. 41. p. 445. 41b. See Priestley's History of Electricity, vol. ii. p. 370.

One of the most curious experiments in this department of electricity is that of making coloured rings on the surfaces of metal, by the electrical explosion. See COLOURS, and FAIRY CIRCLES.

We have already shown how earthquakes may be imitated by the explosion of an electrical battery. See EARTHQUAKE.

The effects of the lateral force of electrical explosion first taken notice of by Dr. Priestley, are best observed in the discharges of a battery; though they may be also seen in the discharge of a single jar.

If pieces of cork, powder of any kind, or any light bodies, be placed near the explosion of a jar, or battery, they will be moved out of their places at the instant of the discharge, in all directions from the centre of the explosion. A remarkable phenomenon of this kind happens in firing gun-powder by electrical explosion; for, let the powder be used to closely confined, if the explosion is made in the centre of it, a part of it only will be fired, and the rest will be dispersed with great violence; and the fragments of a smelted wire, placed in the midst of the powder, will fly about to a great distance from the place of explosion. The greater the force of the explosion, to much the greater will be the distance to which light-bodies will be removed; and therefore it is no wonder that very heavy bodies should be moved to considerable distances by strong balls of lightning. Dr. Priestley apprehends, that this lateral force is produced by the explosion of the air from the place where the explosion is made; for the electrical matter makes a vacuum of air in its passage; and this air being suddenly displaced gives a commotion to all the bodies that happen to be near it. This lateral explosion may be rendered visible, by placing a charged jar on a table, and bringing one end of an insulated metallic rod contiguous to its outside coating, and placing a body of about six or seven feet in length, and a few inches broad, within about half an inch of its other end. Then, if a chain be put upon the table, with one end about an inch and a half distant from the coating of the jar, and one knob of the discharging rod be applied to the other end of the chain, and the other knob to the wire of the jar, so as to make discharge, a strong spark will be seen between the insulated rod, which communicates with the coating of the jar, and the body near its extremity, which spark does not alter the electrical state of this body; and therefore it is imagined, that this lateral force flies from the coating of the jar, and instantaneously returns to it. This phenomenon may probably be owing to the interruption in the circuit; for in proportion to the interruption will be the degree of the lateral explosion. Hist. Electr. vol. ii. p. 336. 3vo. 1775. Phil. Trans. vol. lxx. p. 57.

Dr. Priestley tried the effects of the explosion of a large battery on some of the larger animals, as on a cat and dog, with a design of observing in what manner the animal system is affected by the electrical shock. He found that convulsions attended the stroke, which were followed

by a convulsive respiration, and a rattling in the throat, with other circumstances, for which we must refer to his History, Sec. vol. ii. p. 252. Bro. 1775.

It has been doubted whether, when small animals are killed by the electrical shock, any of the blood-vessels are ruptured; but Mr. Henry informs the editor, that, on giving the shock of a very large battery to a full grown duck, which was instantly killed, the animal bled freely at the mouth, which fully ascertained that fact. The duck was struck by the conductor on the crown of the head, and the charge made to pass through its legs.

We shall close this article with hinting at two circumstances, which should be attended to by those who make experiments with electrical batteries. The jars of a large battery are liable to be broken at the time of their discharge; and particularly if it be conducted of the thinner glass, which is capable of receiving a greater charge than the thicker. In order to avoid this inconvenience, Mr. Nairne never discharges a battery through a poor conductor, unless the circuit be at least five feet long; but the length of the circuit, though it may preserve the battery, proportionally weakens the force of the shock. Care should also be taken not to touch the wires of a battery with the hand, nor even that of a single jar, after the discharge, before the discharging rod be repeatedly applied to its sides; as there generally remains a *residue* of the charge, which is sometimes very considerable. This *residue* is occasioned by the electricity, which, whilst the jar, or battery, is discharging, spreads itself over the uncoated surface of the plate, near the coating; this will not be discharged at first, but gradually returns to the coating after the first discharge.

ELECTRICAL life was contrived by Dr. Franklin, to verify his hypothesis of the identity of electricity and lightning. It consisted of a large, thin silk handkerchief, extended and fastened at the four corners to two light strips of cedar, and accommodated with a tail, loop, and string, to as to rise in the air like those of paper. To the top of the upright stick of the cross a very sharp pointed wire was fixed, rising a foot or more above the wood; and to the end of the twine, near the hand, a silk ribband was tied. From a key suspended at the union of the twine and silk, when the kite is raised during a thunder storm, a phial may be charged; and electric fire collected, as is usually done by means of a rubbed glass tube, or globe. Phil. Trans. vol. xlvii. p. 305. or Franklin's Letters, p. 111.

The inside of papers, covered with varnish, or with well boiled linseed oil, in order to preserve them from the rain, with a black and cane bow, like those of school-boys, will answer the purpose extremely well, and are very useful in determining the electricity of the atmosphere. See CONDUCTORS.

ELECTRICAL machine is a part of the electrical apparatus, contrived for collecting a greater quantity of electricity, and exhibiting its effects in a more sensible manner than it was possible to do in any other way. The parts of which it consists are the electric, the moving engine, the resistor, and the prime conductor. The electric now commonly used is smooth glass; though in the earlier stage of this science, before the method of insulating the rubber, and thereby of producing negative electricity, was introduced, other substances, as sulphur, rough glass or sealing-wax, were used for this purpose. It is not yet absolutely determined what kind of glass is the most proper; the bell glass is generally used. Dr. Priestley suggests, that common bottle metal, on account of its great hardness, and exquisite polish, is fittest for the purpose of excitation. Thinner glass seems to be preferable to that which is thicker; but the workmen should be cautioned not to let the glass suddenly cool, which renders it liable to break in electrical operations. The common form of the electric is either that of a globe or of a cylinder. Each figure has its advantages and its inconveniences. In favour of cylinder, it is alleged, that more of their surface may be touched with the rubber; and, on the other hand, globes may more easily be blown true, so as to press the rubber equally; and they may also be made larger in diameter, whereby their axis, if they have any, is farther from the exterior surface, which is absolutely necessary to prevent the dis-

sipation of the electric fire. Globes are, on this account, made with an neck, cemented to a strong brass cap, in order to adapt them to a proper frame; and Dr. Priestley advises to preserve a communication between the external air, and the air within the globe, by means of a hole in this cap, so that both may be always of the same density. The most convenient size is from nine to twelve inches in diameter. Cylinders are also made with two necks, without any axis, and their common size is from four inches diameter, and eight inches long, to twelve inches diameter, and two feet long.

Some have recommended an internal coating of some electric substance, as resin, turpentine, &c. in order to increase the electrical power of the globe. The best composition for this purpose is prepared by boiling four parts of Venice turpentine, one part of resin, and one part of bees-wax, for about two hours, over a gentle fire, and stirring it often, with the addition of one fourth part of vermillion; which is afterwards left to cool. This mixture may be used, by breaking a sufficient quantity of it into small pieces, putting it into the glass, and holding the glass near the fire till it is melted, and, by continually turning the glass, equally spread over its surface in a coat of about the thickness of a six-pence. Phil. Trans. vol. lvi. p. 186.

There have been various contrivances for giving motion to the electric of a machine. Some have used multiplying wheels, which are easily turned by a winch. The common method is to fix a wheel, grooved round its circumference on the outside of the frame of the machine, which may be turned by a winch; and on the neck of the globe, or cylinder, to fix a pulley, whose diameter is about a third or fourth part of the diameter of the wheel; and a string of wooten, or a leather strap, is put over both the wheel and the pulley; so that by turning the winch the electric may make three or four revolutions for one revolution of the wheel. As the string relaxes by use, it may be proper to make the wheel moveable from the frame, so that it may be fixed by means of a screw at a proper distance, for a sufficient tension of the string; or the pulley may have several grooves, forming circumstances of different diameters for this purpose. Instead of the pulley and string, some have used a wheel and pinion, or a wheel and endless screw, which render the machine more neat and compact; though this construction is not without its inconveniences, which are not so easily remedied as those of the other.

The next principal part of a machine is the rubber, which excites the electric. Rubbers were formerly made of red ball flint, fluffed with hair, wool, flax, or brim; but Dr. Nouth has lately introduced silk cushions, fluffed with hair, over which a piece of leather is to be laid, rubbed with amalgam, which are preferable to the others. If the rubber is fixed on a metal plate, the plate should be free from all edges and points, and covered with silk, it should rest on a spring, so that it may be made to suit any inequality in the surface of the globe, which spring may, by means of a screw, be made to press more or less against the glass at pleasure. The rubber should also be insulated in any way that may best suit the construction of the machine, and the distance of the electric; and a chain or wire may be easily suspended from it, to communicate with the floor, whenever the insulation is not necessary; and thus positive and negative electricity may be produced at pleasure.

The prime conductor, which is a necessary appendage to the electrical machine, in order to collect the electricity from the electric, and the method of insulating it, have been already described. See PRIME CONDUCTOR.

To this general account of electrical machines, we shall subjoin a description of some of the principal now in use, illustrated by corresponding figures. We shall premise, however, a reference to Tab. II. *Electrical*, fig. 16, which represents Dr. Watton's machine, with a contrivance for whirling four large globes at once, and of adding the power of them all; though no such machines are now constructed. Such machines, furnished with suitable batteries, might be employed to very important purposes, and probably lead the way to many new discoveries in the science of electricity.

The machine represented in fig. 17, is the most compact and elegant, were it not liable to many insuperable objections. The globe A is turned with the winch B, by means of wheelwork enclosed in the brass box C; the rubber D is fixed to a spring, the position of which may be adjusted by the screw F; the conductor, G H, is a brass tube, with a round hollow ball at each end, which collects fire in the tube, piece I, fixed in the ball H. The barrel of the conductor is put into the brass socket K, the ball G being first taken off; and to this socket is joined the brass socket N, in which the upper end of the

glass tube *L*, is fixed with cement; and the lower end is cemented into the wooden foot *M*; and it is thus insulated. Machines of this kind may be secured to a table, and used with great ease; but they admit of little variety with respect to the size, shape, or number of the electricity, and the rubber is not insulated.

The machine exhibited in *Tab. III. Electricity*, fig. 18, was invented by Mr. Read, mathematical instrument maker at Knightbridge, and consists of a cylinder *A*, perpendicular to the horizon, and supported by a brass bow, which receives the upper end of the axis. It is moved by means of a pulley at the lower end of the axis, and a wheel *B*, which lies parallel to the table, and revolves four times for every single revolution of the wheel. The conductor *C* is furnished with points to collect the fire, and it is fastened to the wire of a coated rod *D*, which stands in a socket between the cylinder and the wheel. Mr. Lane's electrometer is annexed to the figure, which will be explained under the article *ELECTROMETER*. In this machine the conductor is fixed; but it admits no variety of globe or cylinder, and no insulation of the rubber.

The electrical machine constructed by Dr. Ingenhousz, consists of a cylinder *A*, about nine inches, or a foot, in diameter, which turns vertically, by a brass fixed to the iron axis that passes through the middle of it, and is rubbed by four cushions, each an inch and a half, or two inches long, placed at the opposite ends of the vertical diameter. The frame is a board about a foot square, which may be fastened by an iron crank to a table, supporting two smaller upright boards parallel to one another, and situated at top by a transverse piece; the axis of the plate rests on the middle of these boards, and to them the rubbers are fastened. The conductor is a brass tube, with two horizontal branches, extending from its extremity, and reaching within about an inch and a half of the extremity of the glass, and thus collecting the electricity from it. A machine of this kind was constructed about the same time by Mr. Remond, mathematical instrument maker in London. However ingenious the contrivance of this machine, it is liable to the inconvenience of not easily admitting the insulation of the rubbers.

This machine hath been greatly improved by Mr. Corbherdon, at Amsterdam. He uses two plates of glass, and has contrived to insulate his rubbers in an elegant manner. In short, he hath by these means constructed some of the most powerful, and at the same time portable, and elegant machines that have yet been exhibited.

The machine represented in *fig. 7. Tab. Electricity*, was constructed by Dr. Priestley, and is excellently adapted to all the purposes which the electrician can propose. The frame consists of two boards of mahogany, *a, a*, parallel to one another, and about four inches asunder; the lower board may be fixed to a table by iron cranks; two upright pillars of half an inch are supported by this board, one of which, *b*, being set through the upper, is fixed immovably to the lower board; but the other is made to slide in a groove, reaching almost the whole length of the upper board, so that it may be placed at any required distance from the other pillar, for the convenience of admitting globes, or cylinders, of different sizes; however, it is necessary only when an axis is used. In both pillars there are several holes, by means of which globes of different sizes may be mounted higher or lower, or two or more globes may be used at the same time; though it will be difficult to fix proper rubbers to them all. When a globe with one neck is used, a brass arm, with an open socket, *c*, is necessary to support the axis beyond the pulley; and this part may be put higher or lower, together with the brass socket in which the axis turns. The axis, *d*, is made to pass through the pillar *b*, so that it may be turned by a handle without the wheel. The frame being screwed to the table, may be placed nearer to, or farther from the wheel, as the length of the string in different states of the weather may require. The wheel is fixed in a frame by itself, as *e*, and thus it may have any situation with respect to the pulley, as may be most convenient; and it has several grooves for admitting more strings than one, if two or three globes, or cylinders, are used at once. The rubber, *f*, consists of a hollow piece of copper filled with horse-hair, and covered with a half skin; it is supported by a socket, which receives the cylindrical axis of a round plate of glass, the opposite part of which is inserted in the socket of a bent steel spring *g*. These parts are easily separated, so that the rubber, or the plate of glass, serving to insulate it, may be changed at pleasure. The spring may be either slipped along the groove, or moved in the contrary direction, so as to give it every desirable position with respect to the globe or cylinder; and it is also

furnished with a screw *h*, which makes it press harder or lighter, as the operator chooses. The prime conductor of this machine has been already detailed under the article *PRIME CONDUCTOR*.

When positive electricity is required, a wire or chain, *i*, connects the rubber with the table or floor; and in order to obtain negative electricity, that wire is connected with another cylindrical conductor, whilst the prime conductor in the figure is connected by another wire, or chain, with the table; and the Electricity observes, that the negative and positive powers are equally strong. *Phil. Electr. vol. II. p. 112, 113, 114.*

The machine *fig. 19. Tab. III. Electricity*, was constructed by Mr. Nairn, F. R. S., an ingenious instrument maker in London, for the grand-duke of Tuscany. The glass cylinder of this machine is twelve inches in diameter, and the cylindrical part, exclusive of the necks, is sixteen inches long; the rubber is fourteen inches long, and five broad, supported by two wooden frames, which are fixed on two glass rods lying horizontally under the cylinder, and serving to insulate the rubber; the conductor is five feet long, and twelve inches in diameter, supported on two stands, with solid glass pillars, having at the end of it a short brass rod with a ball; the ball which is represented as receiving the electrical spark from the conductor, it is of brass, and fixed to the end of a brass tube, that is moveable in a hole at the top of the stand; from the bottom of the stand a chain passes along the floor, till it is in contact with the chain hanging from the back of the rubber. The spark from this conductor would sometimes fly to the distance of fourteen inches. See *PRIME CONDUCTOR*. *Phil. Trans. vol. LIII. part I. p. 79.*

Another electrical machine, which we shall describe, is that represented in *fig. 5. Tab. Electricity*. This is of a convenient size, and, in a small compass, possesses the advantages of most other machines. The frame of the machine consists of the board *ABC*, which is capable of being fastened to a table by two iron cranks. On this board are raised two strong wooden pillars, *KI*, and *AI*, which support both the cylinder and wheel. From one of the brass caps of the cylinder *FF*, an axis of steel proceeds, which passes quite through a hole in the pillar *KI*, and has, on the outer side of the pillar, a pulley, *L*, fixed on its square end. In the circumference of the pulley there are three or four grooves, taking the variable length of the string *as*, which goes round one of them, and round the groove of the wheel *D*. The other cap of the cylinder has a small cavity, which fits the cylindrical extremity of a strong screw, that proceeds from the pillar *AI*. The wheel *D*, moved by the handle *E*, turns round a strong axis, projecting from almost the middle of the pillar *KI*. The rubber *G* is a thin quarter of cushion of hair, stuffed with hair, and fastened with silver strings to a piece of wood, adapted to the surface of the cylinder; its length is about four inches less than that of the body of the cylinder, and it sits about one fourth part of its circumference. It is terminated at its upper extremity by a piece of solid felt, which covers almost all the upper part of the cylinder; and at the lower part a piece of leather, well rubbed with amianth, is fastened, which, when turned on the cushion, interposes between it and the surface of the cylinder. The rubber is supported by two springs, screwed to its back, and proceeding from the wooden cap of a strong glass pillar, perpendicular to the board on which the machine rests, and made to slide, by a square wooden bale, in two grooves of this board; and thus the pillar may be fastened by a screw at any required distance from the cylinder, and the rubber made to press harder or lighter upon it. By means of this plate pillar the rubber is insulated; and when insulation is not required, a chain may be hung to it by a small hook, communicating with the leather, and falling down to the table or floor. The prime conductor of this machine, made of hollow brass, (*fig. 4.*) is supported by plate pillars, fixed by brass sockets in the board *CC*; and it receives the electric fluid through the points of the collector *L*, which is placed about half an inch distant from the surface of the cylinder. If the wheel *D* be turned by the handle *E*, in the direction *abc*, and the chain remain suspended from the rubber to the floor, the conductor *AB* will be electrified positively; but if the chain be removed from the rubber to the prime conductor, the rubber will be electrified negatively; and another conductor, like the former, applied to the rubber, will be charged negatively to the same degree, as that was charged positively. *Methods of this construction are made and sold by Mr. Adams, his majesty's philosophical instrument maker, &c. in Fleet-street, London. See Cavallo's Electricity, p. 154, &c.*

Dr. M. Van Marum, a late German writer, has constructed a machine, in which gum lac, in the form of a

on which electric acts: he remarked, that a dry air was most favourable to electrical appearances, whilst a moist air almost annihilates the electric virtue: he also observed the conical figure assumed by electrified drops of water: he considered electrical attraction separately from repulsion, which, he apprehended, had no place in electricity, as a phenomenon similar to the attraction of cohesion; and he imagined, that electricities were brought into contact with the bodies on which they act by their cellular, excited by friction.

The honourable Mr. Boyle added to the catalogue of electric fluidities; but he thought that glass possessed this power in a very low degree: he found, that the electricity of all bodies, in which it might be excited, was increased by wiping and warming them before they were rubbed; that an excited electric was added upon by other bodies as strongly as it acted upon them; that diamonds, rubbed against any kind of fluff, emitted light in the dark; and that feathers would cling to the fingers and to other substances, after they had been attracted by electricities. He accounted for electrical attraction, by supposing a plutonium effluvia emitted from electricities, which laid hold of small bodies in its way, and carried them back to the body from which it proceeded. Otto Guericke, the famous inventor of the air-pump, lived about the same time: this ingenious philosopher discovered, by means of a globe of sulphur, that a body once attracted by an electric was repelled, and continued in this state of repulsion till it had been touched by some other body: he also observed the sound and light produced by the excitation of his globe; and that bodies immersed in electric atmospheres are themselves electrified, with an electricity opposite to that of the atmosphere. The light emitted by electrical bodies was, not long after, observed to much greater advantage by Dr. Wall, who ascribes to light the electrical property which they possess; and he suggests a similarity between the effects of electricity and lightning.

Sir Isaac Newton was not inattentive to this subject: he observed, that excited glass attracted light bodies on the side opposite to that on which it was rubbed; and he ascribes the action of electric bodies to an elastic fluid, which freely penetrates glass, and the emission of it to the vibratory motions of the parts of excited bodies. Mr. Hauksbee, with whom commenced a new era in the history of this science, wrote in the year 1709, and first took notice of the great electrical power of glass, the light proceeding from it, though others had before observed the light proceeding from other electrified substances; and the noise occasioned by it, together with a variety of phenomena relating to electrical attraction and repulsion: he first introduced a glass globe into the electrical apparatus; and to the use of this many of his important discoveries were owing. After his time there was an interval of near twenty years in the progress of this science: till Mr. Stephen Grey established a new era in the history of electricity. To him we owe the capital discovery of communicating the power of native electricities to other bodies, in which it cannot be excited, by supposing them on silk lines, hair lines, cakes of resin, and glass; and a more accurate distinction than had hitherto obtained between electric and non-electric: he also showed the effect of electricity on water much more obviously than Gilbert had done in the infancy of this science. The experiments of Mr. Grey were repeated by M. du Fay, member of the Academy of Sciences at Paris, who added to the number many new experiments and discoveries of his own. He observed, that electrical operations are obstructed by great heat as well as by a moist air: that all bodies, both solid and fluid, were capable of receiving electricity, when placed on warm or dry glass, or sealing-wax; that those bodies which were of themselves the least electric had the greatest degree of electricity communicated to them by the approach of the excited tube. He also transmitted the electric virtue through a distance of 1236 feet; and first observed the electric spark from a living body, suspended on silk lines, and noted several circumstances attending it. M. du Fay likewise established a principle, first suggested by Otto Guericke, that electric bodies attract all those which are not so, and repel them as soon as they are become electric, by the vicinity or contact of the electric body. He also inferred from other experiments, that there were two kinds of electricity: one of which he called the *vitreous*, belonging to glass, rock crystal, &c. and the other *resinous*, as that of amber, gum lac, &c. distinguished by their repelling those of the same kind, and attracting each other. He observed, that communicated electricity had the same property as the excited; and that electric substances attract the air more than conductors.

Mr. Grey, resuming his experiments in 1734, suspended

several pieces of metal on silk lines, and found, that by electrifying them, they gave sparks, which was the origin of metallic conductors; and, on this occasion, he discovered a cone or pencil of electric light, such as is now known to issue from an electrified point. From other experiments he concluded, that the electrical power seems to be of the same nature with that of thunder and lightning.

Dr. Desaguliers succeeded Mr. Grey in the prosecution of this science. The account of his first experiments is dated in 1739. To him we owe those technical terms of *conductors* or *non-electrics*, and *electric per se*, which are explained in the course of this work. He first ranked pure air among the electric per se, and supposed its electricity to be of the vitreous kind. After the year 1742, in which Dr. Desaguliers concluded his experiments, the subject was taken up and pursued in Germany: the globe was now substituted for the tube, which had been used ever since the time of Hauksbee, and a cushion was soon after used as a rubber instead of the hand. About this time, some used cylinders instead of globes; and some of the German electricians made use of more globes than one at the same time. By thus increasing the electrical power, they were the first who succeeded in setting fire to inflammable substances. This indeed was first done by Dr. Laddol, in the beginning of the year 1744, who kindled, with sparks excited by the friction of a glass tube, the ethereal spirit of Frobenius. Mr. Winkel did the same by a spark from his own finger, and kindled French brandy and other spirits by previously heating them. Mr. Grabin fired the smoke of a candle just blown out, and lighted it again; and Mr. Boze fired gun-powder, by means of his inflammable vapour. Laddol the younger, about this time, demonstrated, that the luminous barometer was made perfectly electric by the motion of the quick silver: the electrical tar and electrical bells were also of German invention. Dr. Watson in England made a distinguished figure from this period in the history of electricity: he fired a variety of substances by the electrical spark, and first discovered, that they were capable of being fired by the repulsive power of electricity. In the year 1752, the accumulation of the electrical power in glass, by means of the Leyden phial, was first discovered. See *LEYDEN PHIAL*. For the method practised about this time, of measuring the distance to which the electric shock may be conveyed, see *ELECTRIC CIRCUIT*. Dr. Watson made a very important discovery in this science, that the glass tubes and globes did not contain the electric matter in themselves, but only served as *symplicities* or *dissimulators*, as he expresses it, of that power, which was also confined towards the end of 1746, by Mr. Wilson, who made the same discovery, that the electric fluid did not come from the globe, but from the earth, and other non-electric bodies about the apparatus. Dr. Watson also discovered what Dr. Franklin observed about the same time in America, and called the *par and minus in electricity*. He likewise demonstrated that the electric matter passed through the substance of the metal of communication, and not merely over the surface.

We must omit other experiments and conclusions drawn from them by Mr. Wilson, Mr. Smoot, Dr. Mises, in England; and by the Abbé Nollet, with regard to the effect of electricity on the evaporation of fluids, on solids, and on animal and other organized bodies, in France: The history of natural electricity, commenced in the year 1747.

Whilst the philosophers of Europe were busily employed in electrical experiments and pursuits, those of America, and Dr. Franklin in particular, were equally industrious and no less successful. His discoveries and observations in electricity were communicated in several letters to a friend; the first of which is dated in 1747, and the last in 1754. A summary of his system will be delivered under the articles *THEORY OF ELECTRICITY*, *LEYDEN PHIAL*, and *POINTS*. See also *CHARGING*, *CONDUCTORS*, *ELECTRICS*, &c.

The similarity between lightning and electricity had been suggested by several writers on this subject; but Dr. Franklin first proposed a method of bringing the matter to the test of experiment, by raising an electrical fire by this means from the clouds, in 1752, a month after the electricians in France had verified the same theory, and independently of any knowledge of what they had done: and to him we owe the practical application of this discovery, in securing buildings from the damage of lightning, by erecting metalline conductors. See also *LIGHTNING*.

In the subsequent period of the history of this science, Mr. Canton in England, and Signor Beccaria in Italy, acquired distinguished reputation. They both discovered,

independently of one another, that air was capable of receiving electricity by communication, and of retaining it when received; and they had various contrivances for this purpose. Mr. Canton also, towards the latter end of the year 1753, pursued a series of experiments, which prove, that the appearances of positive and negative electricity, which has hitherto been deemed essential and unchangeable properties of different substances, as, e. g. of glass and sealing-wax, depend upon the surface of the electric, and that of the rubber. This hypothesis, verified by numerous and incontestable experiment, occasioned a controversy between Mr. Canton and Mr. Delaval, who still maintained, that these different powers depended entirely on the substances themselves. About this time, some curious experiments were performed, by four of the principal electricians of that period, viz. Mr. Canton, Dr. Franklin, Messrs. Wilcke and Epinus, in order to ascertain the nature of electric atmospheres; the result of which may be seen under the article *Electric Atmosphere*.

The theory of two electric fluids, always co-existent and counteracting each other, though not absolutely independent, was maintained by a course of experiments on silk flockings of different colours, communicated to the Royal Society by Mr. Symmer, in the year 1759, which were farther pursued by Mr. Cignus of Turin, who published an account of them in the *Memoirs of the academy at Turin* for the year 1765.

Many instances occur in the history of the science about this period, of the astonishing force of the electric shock, in melting wires, and producing other similar effects; but the most remarkable is an experiment of S. Beccaria, in which he tried revivified metals. Several experiments were also made by Dr. Watson, Mr. Smeaton, Mr. Canton, &c. on the passage of the electric fluid through a vacuum, and its luminous appearance, and on the power which particular substances possess of retaining the light communicated to them by an electric explosion. Mr. Canton, S. Beccaria, and others, made many experiments to identify electricity and lightning, to ascertain the state of the atmosphere at different times, and to explain the various phenomena of the *AURORA borealis*, *HALE-SHOWERS*, *HURRICANES*, &c. on the principles of this science.

Those who are desirous of farther information with respect to the history of electrical experiments and discoveries, may consult the excellent work of Dr. Priestley, entitled, "*The History and Present State of Electricity*," &c. Ed. 3. 1775. However, Dr. Priestley is not a mere historian; his work contains many original experiments and discoveries made by himself. He ascertained the conducting power of charcoal, and of hot glass; the electricity of fixed and inflammable air, and of oil; the difference between new and old glass, with respect to the diffusion of electricity over its surface; the lateral explosion in electrical discharges; a new method of fixing circular-coloured spots on the surfaces of metals, and the most probable difference between electrics and conductors; besides a variety of other particulars, too numerous to be recited in this abstract of the history, and yet of considerable importance with regard to the advancement and extension of the science of electricity. We shall endeavour, in the course of this work, to do justice to the merits of other electricians, to whom the science is under any peculiar obligations. The name of Mr. Henry often occurs in articles appropriated to this part of natural philosophy; to him we owe several curious experiments and observations on the electrical and conducting quality of different substances, as CHOCOLATE, VAPOUR, &c. the reason of the difference between them; the fusion of platinum; the nature of the electrical fluid, and its course in a discharge; the method of estimating the quantity of it in electrical bodies by an electrometer; the influence of POINTS, &c. &c.

ELECTRICITY, Experiments and Phenomena in. It may be premised in general for the use of young electricians, who have not access to other treatises on this subject, that every part of the electrical apparatus should be kept clean and dry; that, when the air is dry and the weather frosty, experiments are performed with the greatest ease and advantage; that very hot weather is unfavourable to electrical experiments; that, when the air is damp, they should be performed in a room well dried with a fire. If a glass tube is used, its power may be increased by a small quantity of bees wax drawn over its surface, and the hand should be kept two or three inches below the upper part of the rubber. The globe, or cylinder of a machine, should be first wiped with a clean hot flannel, or an old silk handkerchief; the sliken part of the rubber should be well dried; and the leather that is spread over it should be first rubbed with tallow, and then with

AMALGAM. It may not be improper here to mention the use of Dr. Huggins's amalgam, which is attended with several advantages. 1. It excites a stronger electricity; and 2. Does not fly off from the rubber by the motion of the electric. The composition is four parts of mercury to one of zinc. These are melted together in an iron ladle, over a slow fire. Put in first the zinc, and by degrees add the mercury. It forms a hard mass when cold, which may be warmed again when used; or it may be scraped off with a dull-edged knife, and spread upon the rubber, which is first to be prepared with a little tallow. See an account of Mr. Canton's amalgam, under the article *AMALGAMATION of Tin*.

The rubber, thus prepared, should be made to communicate, when the room is very dry, with moist earth or water, by good conductors; and if the cylinder and rubber are in good order, the which be turned, and no conductors communicate with the electric, the electric fluid will be felt on the knuckle held within a small distance of it, like a current of air, attended with a spark and a crackling noise. When the machine has been used for some time, the electric will collect black spots from the amalgam, or surfaces of the rubber, which must be carefully removed, or they will gradually increase, and prevent its excitation. An incrustation of the same kind will be formed upon the rubber, by which it will be considerably improved; and if this be moistened or scraped, no addition of such amalgam will be necessary. If the coated jars, which are designed for use, be warmed a little, they will better receive and retain the charge. Candles should be placed at a considerable distance from the prime conductor, lest their flames should attract and disperse the electric fluid. The electrical operator should be careful in the use of his machine, jars and battery, that he may sustain no injury by any sudden or unexpected discharge. Effectually to prevent this, we would always recommend the use of a discharging rod, with a handle of glass. With these precautions, there is no part of science that will afford a greater variety of amusing experiments than electricity. We shall select the following as a specimen.

1. If a smooth glass tube be excited by a proper rubber, and the knuckle be moved lengthways from one end of the tube to the other, without touching it, you will hear a continued snapping or crackling noise, and if the room be darkened, sparks of light may be observed wherever the tube frays; and a light may be seen following the hand that rubs the tube. When the tube is in good order, pencils of the electric matter will dart into the air from several parts of it spontaneously, and make a very beautiful appearance. If a rough tube be used with a proper rubber, the electric matter will be seen to spread upon its surface on the approach of the knuckle or any other conducting substance in a very agreeable manner. A large stick of sealing-wax shews this phenomenon to great advantage.

2. If a small light feather be brought near an excited tube, either of smooth or rough glass, it will be attracted, jump to the tube, and flick close to the surface of it, till it be saturated with the electric matter, which, as it is a bad conductor, it receives slowly: it will then be repelled by it, and may be kept suspended or driven about the room by the electrified tube for a considerable time, unless it parts with its electricity to some conducting substance; and in this state of repulsion, the same side of the feather will be always presented to the tube; because, being a bad conductor, the superinduced electricity will be forced by the action of the tube to that side which is farthest from it; and that side will, of course, be most repelled: the charged bottle produces the same effect. If one person holds in his hand an excited smooth tube, and another holds an excited rough tube, or any other electric negatively electrified, at the distance of about one foot and a half, a feather introduced between these two tubes, possessing opposite electricities, will leap alternately from one to the other; or, if a finger is held at eight or ten inches from either tube, the feather will alternately jump from the tube to the finger, and from the finger to the tube. This experiment may be varied, by turning the wheel of an electrical machine with one hand, and holding the other about three or four inches from the end of the prime conductor; then, if a small lock of cotton be let fall on the hand near the conductor, it will jump from the hand to the conductor, and from the conductor to the hand again, being alternately attracted and repelled, and assuming an ebbing form, though its motion will be so quick, that little else besides its colour can be seen.

3. If two feathers of cork balls be suspended, one by a sliken, and the other by a linen thread, an excited tube will attract them both, but repel only the former; and if the

The silk thread be well moistened, the feather suspended by it will be attracted, but no more repelled by the tube; the electric matter in both cases being instantly discharged by the conducting moisture and linen thread. If the small ball suspended by a silk thread of about eight inches in length, be held in the hand, about eight inches from an electrified prime conductor, whose electricity, either positive or negative, is not very strong, it will not be attracted; because, by being insulated, it is incapable of communicating part of its electric matter to, or receiving any from other bodies, and thus of acquiring an electricity opposite to that of the conductor. But if the finger, or any conducting body, be presented to that side of the ball which is farthest from the prime conductor, it will move towards the conductor, having either received or lost electricity, from the body presented to it; and after having touched the prime conductor, it will be repelled by it, both possessing the same kind of electricity, and having either more or less than their natural share of it. However, if the insulated ball be brought very near the prime conductor, or the prime conductor be strongly electrified, it will be attracted without presenting it to any conducting substance; for in this case, the natural electricity of the ball will be forced into the air, or accumulated on the side remotest from the conductor electrified positively; or the redundancy in the ball will be acquired from the air, or its natural quantity will be accumulated on the side nearest to the conductor, electrified negatively. If the silk ball be suspended by a linen thread, it will be attracted at a much greater distance, because the electric fluid will easily pass to it, or from it along the threads; as the prime conductor is electrified positively or negatively.

4. To a ring of wire, at least a foot larger in diameter than the globe of the machine, let pieces of fine linen thread, about five inches long, be tied at the distance of about two inches from each other. Let this ring be held horizontally round the globe, the conductor being first removed, and the globe turned, the threads will be attracted, and point towards the centre of the globe, resembling the spokes of a wheel; in this case, the electric fluid passes freely from the person who holds the ring to, or from the globe, as it is electrified negatively or positively.

5. If a large plummy feather, as *l* (fig. 17, Tab. II. Electricity) be stuck into the prime conductor, and the globe be turned, its fibres will repel each other, and expand in all directions; but if any conducting substance be made to touch the prime conductor; or, if the point of a needle be brought near the feather or the conductor, it will shrink, the electricity being thus taken off; and if the point of the finger be held near the feather, it will cling round it, and bend to the motion of the finger round it.

6. If the conductor, in fig. 17, be placed, so that the points *i* may almost touch the globe of the machine; and Mr. Canton's ELECTROMETER, consisting of small cork or pith balls *O* and *P* annexed to the ends of a linen thread be suspended over the wire *N*, the threads will hang perpendicularly and parallel to one another, and the balls will touch; but if the globe be turned, the balls will be electrified, and repel each other, more or less in proportion to the degree of electricity communicated to the conductor. They are in this case electrified positively, or they receive more than their natural quantity of the electric fluid, which cannot be dissipated in the air as fast as they receive it, and therefore they repel each other; but if the prime conductor were electrified negatively, they would then have less than their natural quantity, and the case would be still the same; no electric substance applied to the conductor can bring them together; but if the prime conductor be touched with some conducting substance uninsulated, the redundancy would be carried off, or the deficiency supplied; and then the balls would immediately come together.

7. The attraction or repulsion of light electrified bodies may be beautifully represented, by suspending the brass-plate *X* from the prime conductor, directly over the plate *Y*, and about three inches from it. See fig. 17. On the lower plate, place any light bodies, as bran, feathers, pieces of paper, or of leaf-gold, and then work the machine; upon which these light bodies will move to and fro between the plates, being first attracted by the upper plate, and then repelled, and having discharged themselves on the lower, they will be alternately attracted and repelled again. If small images, in the shape of men and women, be laid on the lower plate, the images will dance from one plate to the other in an amusing manner. If a piece of leaf gold be cut with a pretty large angle at one extremity, and a very acute one at the other, it will need no lower plate, but will hang by

its larger angle at a small distance from the conductor; and by the continual waving motion of its lower extremity, have the appearance of something animated, nibbling at the conductor, and therefore called by Dr. Franklin the *golden plover*. If the electrical *WILLIS*, already described, be hung from the same conductor, the laughing and dancing will accompany each other; and the amusement may be heightened, by occasionally touching the prime conductor with a finger or brass rod, which would make both to cease at once; and when the finger or rod is removed, both will be renewed. If the application of the finger or rod be artfully concealed, the figures might be made to dance, and the bells to ring, seemingly at the word of command. In this experiment, the light bodies, and the lower plate, being within the atmosphere of the upper electrified plate, become possessed of a contrary electricity, by communicating part of their natural quantity to the conductors with which they are connected; and thus being differently electrified, attract each other; but when these bodies touch the upper plate, they are endued with the same electricity, and are instantly repelled to the lower plate, which, being electrified with a contrary electricity, assists in repelling them back again to the upper one. If the lower plate *Y*, and its stand, be removed, and the light bodies be put upon a clean dry pane of glass, and held by one corner under the plate *X*, the experiment would not succeed; because they cannot part with any of their natural quantity of the fluid, and become possessed of an electricity contrary to that of *X*; but if a finger, or any conductor, be presented to the lower side of the glass, the attraction and repulsion will take place, because the bodies will now part with their electricity to the upper surface of the glass, and charge it; the electric fluid belonging to the lower surface being repelled and carried away by the conductor. If the prime conductor were electrified negatively, the effect would be the same; but the electricity of the plates would be reversed, the upper plate being electrified negatively, and the lower plate electrified positively. If a person, standing on an insulating stool, and having in his hand a chain fastened to the prime conductor, stretch the other hand over the light substances on the lower plate, they will perform the dances already described.

8. Let a bent wire *CDE* (fig. 20, Tab. III.) be fastened to the outside of a coated jar, and be so bent as to have its knob *E* at the same height with the knob *A* of the jar; let a piece of cork be cut in the shape of a spider, and linen threads be drawn through it with a needle, and cut to a proper length to represent its legs; and then suspended by a silk thread, so as to hang exactly in the middle between the knobs *A* and *E*; charge the jar, by bringing the knob *A* in contact with the prime conductor, and place it exactly where it stood before it was charged; the spider will now begin to move from knob to knob, stretching his legs towards each ball as he approaches it, and grasping each ball with them when he touches it, as if he were really animated, and continue its motion for a considerable time, till the jar is almost discharged. The spider is first attracted by the knob *A*, which communicates with the inside of the bottle, and receiving part of its electricity, is repelled, and discharges it on the knob *E*, communicating with the outside of the jar; and it is then alternately attracted and repelled by *A* and *E*, till the discharge is nearly completed, and the equilibrium between the opposite electricities of the inner and outer surfaces of the jar is nearly restored.

9. Let a metal cup, almost full of water, be suspended by a loop or bow from the prime conductor, and the wheel of the machine be turned, so as to electrify the water; and a finger be held then perpendicularly over the water, and very near it, the electrified water will rise in a cone towards the end of the finger, and, in a dark room, a stream of fire will be seen to issue from the water to the finger. If one leg of a glass syphon be put into this water, and the other leg be drawn out into a capillary bore, that the water may only just drop out of it, and the water be electrified, it will run in a continued stream, which, in the dark, will be beautifully illuminated. If an un electrified person with his finger, or a piece of metal, touch the prime conductor, the stream will stop, and the light disappear; and when the metal is removed, both will be renewed.

10. Electric attraction and repulsion may be exhibited by means of the electric light, by fixing two pointed wires, one in the prime conductor, and the other in the rubber; when the wheel is turned, the point of the former wire will be illuminated with a BRUSH or PENCIL, and that of the latter with a STAR: if an excited glass tube be brought near the first wire, the brush will be turned aside or repelled by the atmosphere of the tube;

tube; and if it be held directly opposite to the point, the brush will vanish: but if the excited tube be brought near the point of the wire, fixed upon the rubber, the star will turn towards the tube, the wire in this case attracting and receiving the electricity of the tube. If an excited stick of sealing wax or other substance negatively electrified be applied in the same manner, the appearances will be directly the reverse.

11. If a fly, as D (fig. 4. Tab. Electricity) made of small brass wires and fixed in a brass cap, or put upon the pointed wire K, and lowered to the prime conductor, and the wires *a, b, c, d*, are pointed, and bent in the same direction; when the wheel of the machine is turned, a flame will be seen at each point, and the fly will turn round in the direction of the letters *a, b, c, d*, contrary to that of the points of the wires; for the air, contiguous to the points, becomes possessed of a strong *electricity*, of the same kind with that of the points, and therefore the air and the points will repel each other. The experiment may be rendered more striking, by fastening the figures of horses cut in paper to the wires, in such a manner, that the points may be in their tails, and then the horses will seem to pursue each other; whence the experiment is called the electrical horse-race. If a circular plate of metal be cut into the shape of a star, so that every point may be at the same distance from the centre, and the centre be made to turn freely on a point, like the wires in the preceding experiment, a small flame will be seen at every point; and if the star be turned round, it will exhibit the appearance of a lucid circle, without any discontinuance of the light.

12. The effects of electrical attraction and repulsion may be represented in a very striking manner, by electrifying a hoop of metal, suspended from the prime conductor, about half an inch above a plate of metal, and parallel to it; and placing a round glass bubble, blown very light, upon the plate near the hoop; the bubble will be immediately attracted to the hoop, and the part which touches it acquiring electricity from it, will be repelled; but, as the electric virtue is not diffused over the whole surface of the glass, part of it will be again attracted by the hoop, whilst the electrified part goes to discharge its electricity upon the plate; and this will occur a revolution of the bubble round the hoop, as long as the electrification is continued. In a dark room the glass ball will be beautifully illuminated. Two balls may be made to move round the same hoop, one on the inside and the other on the outside, in the same, or in opposite directions: if more hoops are used, a greater number of bubbles may be made to revolve, and a kind of planetarium or orrery be constructed, with a ball over the centre of the hoop, to represent the sun in the centre of the system.

13. If a metal rod with a round knob be presented to the electrified prime conductor, the electric matter will pass with violence from the one to the other; an electric spark, with the appearance of fire, will be seen darting between them, and a report, usually compared to a snapping noise, will be heard. The longest and broadest spark will be drawn from that end of the prime conductor which is farthest from the cylinder, or from the knob I of the rod B I fixed at the end of it. See fig. 4. Tab. Electricity.

This spark will issue in a great variety of crooked directions, exactly resembling the course of lightning; and the representation of it may be seen, fig. 10. Tab. III. A friend of Dr. Franklin supposes, that the spark is thrown out of a straight course by the density of the air, increased by the action and reaction of the two fluids, which are repulsive of one another. Franklin's Letters, p. 167. If the brass plate N (fig. 17. Tab. II.) be hung on the prime conductor, and the room be darkened, streams of fire will be seen to issue from the plate to the knuckles, held near the edge of it, and to follow the hand moved round its edge, when the conductor is electrified. The electric light may be made to flash between two metallic plates, if they are held back to back, parallel to one another, and about two inches asunder, the one by an insulated person connected with the prime conductor, and the other by a person standing on the floor. When the wheel of the machine is turned, flashes of light may be observed between the two plates so dense and so frequent, that any thing may be distinguished in a dark room. Sparks may be also drawn from any part of the body of a person insulated and connected with the prime conductor. They may be communicated from a smooth ball of metal annexed to a wire held in the hand of the insulated person to any other on the floor.

14. If two persons be insulated, and one of them be electrified positively, and the other negatively, either of them touching a person standing on the floor will give a

moderate spark; but if they touch one another, the spark will be much stronger, and they will both be unelectrified, the redundancy of the one supplying the deficiency of the other; but if both persons had been electrified either positively or negatively, there would have been no spark on their touching one another.

15. There are various methods of setting fire to inflammable spirits by the electric spark. This may be easily done, by suspending from the prime conductor a thin rod, with a small knob at its end, and then passing some spirit of wine, a little warmed, into a metal spoon, which should be held about an inch below the knob; if the wheel is turned, a spark will proceed from the knob and kindle the spirits.

If a person standing on an insulated stool, communicating with the prime conductor, holds the spoon in his hand, and another person on the floor brings his finger, or a piece of ice within a small distance of it, the spirits will be set on fire; or, the spirits may be held by the person on the floor, and the insulated person may communicate the spark by any conductor. Many other substances which throw out an inflammable vapour, may be kindled in the same manner.

16. Gun-powder may be fired by filling a small cartridge of paper or the tube of a quill with it, and inserting two wires, one at each end, so that their ends within the quill or cartridge may be about one fourth or one-fifth of an inch from one another; then, if the charge of a phial be conveyed through these wires, the spark passing from the inner end of one to that of the other, will set fire to the gun-powder. Steel-filings mixed with the powder will make it take fire more readily.

17. The electric light is most beautifully exhibited in glass tubes and phials, exhausted of their air. Thus, if a glass tube, about two inches in diameter, and about two feet long, with a brass cap fixed to one end, and a stop-cock or valve to the other, be exhausted of its air, it will appear to be full of light, whenever a spark is taken by it from the prime conductor, or an electric is discharged through it. Thus also, if a wire be made to pass through a tall receiver of an air-pump, and the end of the wire within the receiver be moderately pointed, and the other end furnished with a knob; when the receiver is exhausted of its air, and the knob of the wire brought into contact with the prime conductor, every spark will pass through the receiver in a large diverging body of light, from the wire to the plate of the air-pump. Dr. Watson has given us a particular account of several curious phenomena of electricity in vacuum, in the Philosophical Transactions, vol. xliii. p. 362, &c. The electric fluid, in its passage through an exhausted tube, nearly three feet in length, and almost three inches in diameter, assumes a very agreeable spectacle in a darkened room. We may observe, not as in the open air, bristles or pencils, of rays an inch or two in length, but contractions extending through the whole length of the tube; that is, in his experiment, thirty-two inches, and of a bright silver hue. These did not immediately diverge, as in the open air, but frequently, from a base apparently flat, divided themselves into less and less ramifications, and resembled very much the most lively contractions of the aurora borealis. At other times, when the tube has been exhausted in the most perfect manner, the electrician has been seen to pass between two brass-plates, contrived so, that they might be placed at different distances from each other, in one continued stream, of the same dimensions through its whole length. The same experiments were tried with a Torricellian vacuum, very ingeniously contrived by lord Charles Cavendish.

The apparatus (see fig. 21. Tab. III. Electricity) consisted of a cylindrical glass tube of about three-tenths of an inch in diameter, and of seven feet and a half in length, bent in such a manner, that thirty inches of each of its extremities were nearly straight, and parallel to each other, from which an inch fringe, which was likewise of thirty inches. This tube was carefully filled with mercury; and each of its extremities being put into its basin of mercury, so much of the mercury ran out, until, as in the common barometrical tubes, it was in equilibrium with the atmosphere. Each of the basins containing the mercury was of wood, and was supported by a cylindrical glass, of about four inches in diameter, and six inches in length; and these glasses were fastened to the bottom of a square wooden frame, so contrived, as that its top was suspended by silk lines, the tube filled with mercury before mentioned, so that the whole of this apparatus might be moved together without inconvenience. The Torricellian vacuum then occupied the space of about thirty inches. In making the experiment, when the room was darkened, a wire from the prime conductor of the electrical machine communicated with one of the basins of mercury; and any conductor touching

reaching the other basin, while the machine was in motion, the electricity pervaded the vacuum in a continued arch of lambent flame; and, as far as the eye could follow it, without the least divergency. 8. Secondly observed, that no electric light is visible in a barometer, in which there is a perfect vacuum, and hence infer, that electric light is visible only by means of some vibrations which it excites in the air; and Mr. Walth has lately discovered, that an electric spark would no more pass through a vacuum of the more perfect kind, made in the above-described sealed barometer by the assistance of Mr. de Luc, than through a thick of solid glass. Mr. Naime constructed a barometer on purpose to repeat this experiment; but his was a common straight tube, in which the mercury was sealed, and he affirms, that it was as perfect a vacuum as art could make; but the vacuum of this became perfectly luminous at three feet from the large conductor to the grand duke of Tuscany's machine. Note, Mr. Walth's was the atched barometer of Lord Charles Cavendish before mentioned, and the design of Mr. de Luc in preparing it, was to render the illuminated vacuum more beautiful. See *AURORA AEREA* and *LUMINOUS CONDUCTOR*.

18. There have been many contrivances for giving various forms to the appearance of the electric spark in its passage from one conductor to another. This may be done by means of a board, and a number of wires, in the following manner: let two holes be made through the board, about one-fourth of an inch on each side of the spot where a spark is desired; let the extremities of the wires, neatly rounded, come through these holes, and be brought near together, exactly over the place; and let the wires on the backside of the board be disposed, as that an electric spark must take them all in the same circuit. When they are thus prepared, all the points will appear luminous at once, whenever a spark is taken by them at the prime conductor. In this manner, says Dr. Priestley, beautiful representations may be made of any of the constellations, as of the Great Bear, Orion, &c. and thus also may the outlines of any drawing, as of figures in tapestry, be represented.

A spiral line of fire may be exhibited by the instrument in fig. 22. Tab. III. composed of two glass tubes, C D, one within another, and closed with two knobbed brass caps, A and B; the innermost tube has a spiral row of small round pieces of tin-foil stuck on its surface, at the distance of about one-thirtieth of an inch from each other. If one end of this instrument be presented to the electrified prime conductor, every spark will be seen to pass with a spiral motion from one of these pieces to the other round the small tube. Pieces of tin-foil may also be disposed of on a flat piece of glass A B C D (fig. 23.) so as to represent flowers, letters, &c. and they may be illuminated by holding either extremity C or B, in the hand, whilst the other is presented to the electrified prime conductor.

19. There are various ways of receiving and transmitting the electric shock. If a person puts one hand to the coating of a charged jar, and the finger of the other hand to the wire, he will receive a shock through his arms and head. If a number of persons join their hands, or for the sake of varying the experiment, tread on one another's toes, or lay their hands on each other's heads, and a person at one end of the circuit touch the outside of a jar, whilst a person at the other extremity touches the wire, the shock will be felt by all at the same time. The shock may also be communicated, if a basin of water be placed between every two of the persons who are to receive it, and they dip the fingers of the hands in the water, that would otherwise have been joined. See *CIRCUIT*. Electric shocks may likewise be given to any particular part of the body, without affecting the rest, by bringing that part only into the electrical circuit: thus, if a chain connected with the outside of a jar charged by the prime conductor, be tied with a silk string or ribbon to the elbow, and another chain be applied in the same manner to the shoulder, and brought into contact with the prime conductor, the shock will only be felt from the shoulder to the elbow. See *METHOD OF ELECTRIZING* and *ELECTROFUGATOR*.

A very convenient apparatus hath been contrived for this purpose by Mr. Henry, which hath been much approved. A curious apparatus hath also been contrived by Mr. Partridge, which he very properly calls *directors of the shock*, and by which it may with great facility be determined to any part of the body. Mr. Birch hath very considerably improved the electrical apparatus for medical purposes, for an account of which, see *Adam's Essay on Electricity*, p. 328, &c. octavo. 1785.

20. If a few sheets of a quire of paper, or the cover of a book or card, be interposed in the circuit of an electrical explosion, they will be perforated by the discharge, and the hole will give a strong smell of sulphur.

21. The direction of the electric fluid in a discharge, may be shown, by causing the explosion to pass over the

surface of a card, in the following manner: by two wires, one on one side of the card, and the other under it, in the same direction, and with their extremities about an inch distant; then by connecting one of the wires with the outside of a charged jar, and the other wire with the knob of the jar, the electric fluid will run over that surface of the card, upon which the wire lies that is connected with the positive side of the jar; and in order to pass to the extremity of the other wire, it will break a hole through the card just over the extremity of the wire that is connected with the negative side of the jar. This is a curious experiment of Mr. Lallin, but the honourable Frederic Chilian Malmberg, consul of Ratis at Copenhagen, has admirably improved this experiment, by first painting the card in a line about half an inch broad on each surface with vermilion. Mr. Henry has presented an account of it to the Royal Society; for which, see *Phil. Trans.* vol. lxxii. part ii. 276, 492, 25. The course of the electric fluid may also be exhibited by the following experiment of Mr. Henry: a small phial, represented fig. 24. Tab. III. is coated on the outside, about three inches from the bottom, with tin-foil; to the top is cemented a brass cap with a hole and valve, and from the cap a wire proceed within the phial, terminating in a blunt point. When the phial is exhausted of its air, a brass ball is forced on the cap to defend the valve, and prevent air from getting into the exhausted phial. If this phial be held by its bottom, and the brass knob be presented to and held in contact with the prime conductor electrified positively, the electric fluid will cause a pencil of rays to proceed from the wire within the phial, as in fig. 201 and if it be discharged, a star will appear in the room of the pencil, as in fig. 241: but if this phial be held by the brass cap, and its bottom be made to touch the prime conductor, then the point of the wire within it will appear illuminated with a star, when charging, and with a pencil, when discharging. All these appearances will be reversed, when it is presented to a conductor electrified negatively. See *LUMINOUS CONDUCTOR*.

22. The direction of the electric fluid may also be exhibited by fixing to the end of the prime conductor, a remnant from the machine, a brass rod six inches long, with a brass ball at its extremity, about three-fourths of an inch in diameter, and when the wheel of the machine is turned, let the flame of a wax taper be presented to the ball, and it will be blown almost horizontally from the ball, and in the direction of the electric fluid; but if a like wire and ball be fixed to the insulated rubber, the flame of a wax taper presented to the ball, will be blown upon the ball, shewing the true course of the fluid in its passage to the rubber that is receiving it. See *EXPERIMENTS WITH THE ELECTRICAL RUBBER*. See *ELECTRICAL THEORY* and *UNIFORM DISCHARGE*.

Experiments with the Leyden Phial. See *LEYDEN PHIAL*. *Experiments on the Use and Efficacy of POINTS.* See *POINTS*. *ELECTRICITY, MEDICAL.* It is natural to imagine, that a power of such efficacy as that of *electricity* would be applied to medical purposes; especially, since it has been found, invariably, to increase the sensible perspiration, to quicken the circulation of the blood, and to promote the glandular secretion; (though from a late experiment it has been inferred, that simple *electricity* does not accelerate the pulse; accordingly, many influences occur in the later period of the history of this science, in which it has been tried, with considerable advantage and success. Among the variety of cases to which it has been applied, there are none in which it seems to have been prejudicial, except those of pregnancy and of the venereal disease. In most disorders, in which it has been used with perseverance, it has given, at least, a temporary and partial relief, and in many, effected a total cure. The first instance that occurs of its salutary effects, is that of a woman, who was cured in a quarter of an hour of a contracted finger, by M. Krautewitz, at Halle, as early as the year 1744. It was afterwards applied in a variety of paralytic cases, by M. Jallabert of Geneva, in 1769; M. Sauvages, of the academy in Montpellier, in the course of whose experiments, it appeared, that electrification increases the circulation of the blood about one-sixth. Mr. Parrich Brydone in Scotland, in 1757; the Abbe Nollet, and others; in several of which cases perfect relief was obtained, but the beneficial effect does not appear to have been permanent. One instance occurs, related by Dr. Haer, of Shrewsbury, and recorded in the Philosophical Transactions, vol. xlviii. part ii. p. 783, in which electrification was injurious, and brought an universal palsy on a young person, whose right arm was paralytic; and though this palsy was removed by a course of medicine, the diseased arm remained incurable. It also appears, from a number of experiments made by Dr. Franklin in paralytic cases, that no permanent advantage was derived from *electricity* in this disorder; and Mr. Wesley, who has

been long engaged in a course of medical electricity, observes, that though many paralyses have been helped by it, no palsy of a year's standing has been thoroughly cured by it. However, a remarkable instance more lately occurs, in which an hemiplegia was cured by this means, under the direction of a physician at Greenwich. The patient was in such a state, that boiling water might be applied from her hand to her shoulder, and from her shoulder to her foot, on the diseased side, without being felt. This person was electrified, by drawing sparks from the pained side, and giving shocks, beginning with stronger shocks, till she began to feel them, and continuing moderate ones, for 18 days; and in that time, during 31½ hours, the number of shocks was 144; and this perseverance was attended with such success, that her feeling was quite restored, and that she became capable of walking, and of writing with the hand, the use of which she had lost. Dr. de Haen observes, that with respect to partial palsy, electrification never did the least harm; and that one of two persons, who had received no benefit from it in six entire months, were yet much relieved by persevering in the use of it; and that some persons discontinuing it, after having received some benefit, relapsed again; but afterwards, by recurring to the use of electricity, recovered, though more slowly than before.

Dr. Hart, in 1766, mentions a cure performed on a woman, whose hand and wrist had been for some time rendered useless, by a violent contraction of the muscles; but the most remarkable case of this kind is that related by Dr. Watson, Phil. Trans. vol. lili. p. 10. The patient, about seven years of age, was seized with an universal rigidity of her muscles, so that her whole body felt more like that of a dead corpse than of a living person. Dr. Watson electrified her, at convenient intervals, from the middle of November 1761 to the end of January 1765; when every muscle of the body was perfectly flexible, and subservient to her will, so that she could stand, walk and run like other children of her age. Mr. Miles Partridge has lately communicated to the Royal Society a surprising instance of the cure of a very great degree of contraction and rigidity in the lumbosacralis muscle, by means of electrical sparks and shocks. Phil. Trans. vol. lxxviii. part i. p. 67, &c. Mr. Wilson mentions a single instance, in which he has cured deafness of fourteen years continuance; but he acknowledges, that he tried similar experiments on six other deaf persons without success. Mr. Lovet and Mr. Wesley have extended the medical application of electricity to a greater variety of cases than any others. Mr. Lovet observes, in his Essay, that electricity is almost a specific in all cases of violent pains; of however long continuance, in any part of the body; as in obdurate head-aches, the tooth-ach, the sciatica, the cramp, and disorders resembling the gout; and in the last-mentioned kind to cure rheumatisms, or a swelling of the muscles, and hysterical disorders; he adds, that it cures inflammations, and a fistula lachrymalis; that it has stopped a mortification, and dispersed extravasated blood; that it has been of excellent use, in bringing to a suppuration, or in discharging without suppuration, obdurate swellings of various kinds, even those that were scrophulous; that it has cured the falling-sickness, and several kinds of fits, and a disorder that seems to have been a *puta ferax*. He advises to begin, in general, with simple electrification, especially in hysterical cases; then to proceed to take sparks, and lastly to give moderate shocks. Mr. Wesley observes, that he has scarce known an instance, in which shocks all over the body have failed to cure a tertian or quartan ague; he mentions a case of blindness cured and relieved by it, and hearing given by it to a person who was born deaf; and he farther says, that it has cured bruises, removing force, the dropsy, and a palsy in the tongue; and that it has brought away gravel from the kidneys. In hysterical cases, he recommends the patient's being simply electrified, by sitting on casks of resin, at least for half an hour morning and evening; and then taking small sparks from him, and afterwards giving shocks, more or less strong, as the disorder requires. Dr. Antonius de Haen, in his Ratio Medendi, cited by Dr. Priestley, Hist. Electricity, vol. I. p. 485, &c. informs us, that a paralytic and trembling of the limbs, from which every cause is gone, never failed to be relieved by electricity; and that it also certainly cures St. Vitus's dance; that it has been of some use in cases of deafness; but failed in its application to a *puta ferax* and strumous neck. Mr. Hay, Surgeon of London, mentions several cases, in which the power of electricity has been successfully applied to an AMAUROUS. The machine was used twice a day; the patient was placed on a stool with glass legs, and had sparks drawn from the eyes and parts surrounding the orbits; especially where the superciliary and infra-orbital branches of the fifth pair of nerves spread themselves. After this operation had been continued for half an hour,

the patient was made to receive for an equal time light shocks through the affected parts, which were sometimes directed across the head, from one of the temples to the other, but chiefly from the superciliary and infra-orbital branches to the occiput. Mac. Obs. and Inq. vol. vi. p. 106. In rheumatic cases, Mr. Ferguson observes, that he has generally found electricity successful, by continuing to take sparks from the places where the pain lies, till the skin has been red and pimpled, and the patient has felt a glowing warmth where the sparks were drawn off; and the same method has also proved effectual in old fractures. The use of electricity has been lately recommended in cases of sudden death. See DROWNING.

In all cases where shocks are given, gentle ones should be first used; and if the disorder continues, they may be gradually increased; and they should be confined to the affected part. The efficacy of electricity in the tooth-ach is so great, that it seldom or ever fails to give immediate relief, unless the tooth be very much decayed. The following instrument will serve for this purpose: it consists of two wires, A E and B E, fixed in the piece of baled wood H, and bent at C D and F G, and at A and B, as in fig. 25. Tab. III. Electricity. If the affected tooth be brought within the two wires at E, and the ring A or B be connected by a chain, with the outside of a charged jar, and the other ring be connected by a chain with the knob of the jar, the shock will pass through the wires, and consequently through the tooth. The modes of applying electricity to the human frame, formerly used, were by the shock and sparks, and sometimes, though rarely, by simple electrification. These modes are now varied and multiplied, according to the circumstances of the patient, and the nature of his disorder. Under the conduct of Mr. Buch, an eminent surgeon, who has particularly directed his attention to the improvement and application of medical electricity, and of every gentleman of the profession, we have reason to expect every degree of efficacy and success of which it is capable. For an account of their medical apparatus, and of various modes of applying it in different disorders; see Adams's Ess. on Electricity, chap. 15, octavo. 1785.

Dr. Cullen says, that electricity, when properly applied, is one of the most powerful stimulants that can be used to act upon the nervous system of animals. Mr. Buch considers electricity, applied under the form of a fluid, as a sedative, under that of a spark or friction, as a stimulant, and by way of a shock, as a disobscure, in its action. Under this head of medical electricity, it may be proper just to mention those medicated tubes, the imaginary virtues of which were first discovered by Signior Pirati at Venice, and which were most recommended in the years 1747 and 1748, both in Italy and by Mr. Wmiller at Leipzig. These gentlemen imagined, that odorous substances, confined in excited glass vessels, would transpire through the pores of the glass, and communicate their medicinal virtues to the atmosphere of a conducter, and to all persons in contact with it; and that these substances would yield their virtues by being laid in the hands of persons electrified; and they pretended that many cures were wrought in this way, by the operation of medicines, without being taken into the stomach; but the whole was soon discovered to be a fallacy; and it was inconclusively proved, that no effluvia could pass from the included substances through the pores of excited glass; and that no method was known for causing the power of medicine to insinuate itself into the human body by electricity. Dr. Franklin, by proving that glass was impervious to the electric fluid itself; and that its electricity was collected from the rubber, &c. evinced the absurdity of every attempt to transmit the effluvia of any substances through the glass. See Franklin's Letters, p. 82, &c.

ELECTRICITY, theory of. It will be needless to recite the ancient hypotheses on this subject, such as that of the sympathetic power of the Peripatetics; that of odorous effluvia emitted by excited bodies, and returning to them again, adopted by Gilbert, Galenus, Sir Kenelm Digby, &c. or that of the Caristians, who ascribed electricity to the globules of the fire elements, discharged through the pores of the rubbed substance, and in their return carrying with them those light bodies, in the pores of which they were entangled. These hypotheses were framed in the infancy of the science, and of philosophy in general, and have been long since exploded. In the more advanced state of electricity, there have been two principal theories, each of which has had its advocates. The first we shall mention is that of two distinct electric fluids, repulsive with respect to themselves, and attractive of one another, adopted by Mr. du Fay, on discovering the two opposite species of electricity, viz. the vitreous and resinous, and since new-modelled by Mr. Symmer. These two fluids are supposed to be equally attracted by all bodies, and to exist, in intimate union, in their pores; and in this state to exhibit no mark of their existence. The friction of an electric,

Electric, by a rubber, separates these fluids, and causes the vitreous *electricity* of the rubber to pass to the electric, and then to the prime conductor of a machine, and the glass *electricity* of the conductor and electric to be conveyed to the rubber; and thus the quality of the electric fluid possessed by the conductor and the rubber is changed, but the quantity remains the same in each. In this state of separation, the two electric fluids will exert their respective powers; and any number of bodies charged with either of them will repel each other, attract those bodies that have less of each particular fluid than themselves, and be still more attracted by bodies that are wholly destitute of it, or that are loaded with the contrary. According to this theory, the electric fluid makes a double current; one fluid passing to an electrified conductor from any substance presented to it, whilst the same quantity of the other fluid passes from it; and when each body receives its natural quantity of both fluids, the balance of the two powers is restored, and both bodies are unelectrified. This also, when a phial is charged by a conductor, the vitreous *electricity* of that fluid which is connected with the conductor is transmitted to the opposite side connected with the rubber, and an equal quantity of the vitreous *electricity* is returned from this side to the other; so that all the vitreous *electricity* is conveyed to one of the sides, and all the resinous to the other. In this state they mutually attract each other through the substance of the intervening glass, are thus prevented from being drawn away by any force that can be applied to them separately, and rush to one another by means of proper conductors. For a further account of the explanation of some of the principal phenomena of *electricity* by this theory, we shall refer the reader to Dr. Priestley's History, vol. ii. § 3, who, with a philosophical liberality, has dated it in its full force, though he adopts the other theory, which we shall now offer in as few words as the nature and importance of it will allow. This is commonly distinguished under the denomination of *positive and negative electricity*, and was first suggested by Dr. Watson, and digested, illustrated, and confirmed by Dr. Franklin; and has been since known by the appellation of the Franklinian hypothesis. This theory supposes, that all the phenomena of *electricity* depend on one fluid, *vis generis*, extremely subtle and elastic, dispersed through the pores of all bodies, by which the particles of it are so strongly attracted as they are repelled by one another. When bodies possess their natural share of this fluid, or such a quantity as they are capable of retaining by their own attraction, they are then said to be in an unelectrified state: but if the equilibrium is disturbed, and they either acquire an additional quantity from other bodies, or lose part of their natural share by communication to other bodies, they exhibit electrical appearances. In the former case they are said to be electrified positively, or *plus*; and in the latter, negatively, or *minus*. This electric fluid is supposed to move with great ease in those bodies that are called conductors, and with extreme difficulty and slowness in the pores of *electrics*; whence it comes to pass, that all *electrics* are impenetrable to it. Moreover, *electrics* are supposed to contain always an equal quantity of this fluid, so that there can be no over-charge or increase on one side without a proportionable decrease or loss on the other, and *vice versa*; and as the electric does not admit the passage of the fluid through its pores, there will be an accumulation on one side, and a corresponding deficiency on the other. See *CHARGE*. When both sides are connected together by proper conductors, the equilibrium will be restored by the redundant fluid's running from the over-charged to the exhausted surface. Thus also if an electric be rubbed by a conducting substance, the *electricity* is only conveyed from one to the other, the one giving what the other receives; and if one be electrified positively, the other will be electrified negatively, unless the loss be supplied by other bodies connected with it, as in the case of the electric and insulated rubber of a machine. The manner in which this effect is produced, has not yet been sufficiently explained; S. Beccaria supposes, that the surface of the electric is enlarged by the action of the rubber, and rendered capable of receiving a greater quantity of the electric fluid from it, which additional *electricity* appears on the surface of the electric, when the rubber is withdrawn, and the capacity of the electric is again contracted. This theory serves likewise to illustrate the other phenomena and operations in the science of *electricity*. Thus, bodies differently electrified will naturally attract each other, till they mutually give and receive an equal quantity of the electric fluid, and the equilibrium is restored between them. Beccaria supposes, that this effect is produced by the electric matter making a vacuum in its passage, and the contiguous air afterwards collapsing, and thereby pushing the bodies together. Bodies having the same kind of *electricity*, whether it be positive or negative,

will repel each other; because neither the augmentation nor diminution of the electric fluid on the surface of any body can take place, unless that surface be contiguous to an electric, which can acquire a contrary *electricity* to a small distance; and therefore the augmented or diminished quantity, in endeavouring to diffuse itself over every part of the surface of electrified bodies, on account of the attraction subsisting between the electric fluid and all the particles of matter, will make the bodies recede from each other, so that a quantity of air may be interposed between their surfaces, sufficient to acquire a contrary *electricity* at a small distance from them.

The influence of points in drawing or throwing off the electric fluid, depends on the less resistance which it finds to enter or pass off through fewer particles than through a greater number, whose resistance is united in flat or round surfaces. The electric light is supposed to be part of the electric fluid, which appears when it is properly agitated; and the sound of an explosion is produced by vibrations, occasioned by the air's being displaced by the electric fluid, and again suddenly collapsing.

As to the nature of the electric fluid, philosophers have entertained very different sentiments; some, and particularly Mr. Wilson, have supposed, that it is the same with the ether of Sir Isaac Newton, to which the phenomena of attraction and repulsion are ascribed; whilst the light, smell, and other sensible qualities of the electric fluid are referred to the grosser particles of bodies, driven from them by the forcible action of this ether; and other appearances are explained by means of a subtle medium diffused over the surfaces of all bodies, and retaining the entrance and exit of the ether, which medium is supposed to be the same with the electric fluid, and to be more rare on the surfaces of conductors, and more dense and residing on those of *electrics*; but Dr. Priestley has shown, that though they may possess some common properties, they have others essentially distinct; the ether is repelled by all other matter, whereas the electric fluid is strongly attracted by it. Others have had recourse to the element of FIRE; and from the supposed identity of fire and the electric fluid, as well as from the similarity of some of its effects, the latter has been commonly called the electric fire; but most electricians have supposed, that it is a fluid *vis generis*. The honourable Mr. Cavendish has published an attempt to define and explain some of the principal phenomena of *electricity* in a mathematical, systematical manner from the nature of this fluid, considered as composed of particles which repel each other, and attract the particles of all other matter, with a force inversely as some less power of the distance than the cube, whilst the particles of all other matter repel each other, and attract those of the electric fluid, according to the true law. Phil. Trans. vol. lxi. part ii. p. 384-397. A similar hypothesis and method of reasoning have been also proposed by Mr. Tinnin, in his Tentamen Theoricæ Electricitatis & Magnetismi.

Dr. Priestley concludes, from experiments made with a view of determining the effects of the electrical explosion on different kinds of air, that the electric matter either is, or contains *phlogiston*, since he found that both produced similar effects. Mr. Henry also apprehends, that the electric fluid is a modification of that element, which, in its quiescent state, is called *phlogiston*; in its first active state, *electricity*; and when violently agitated, fire; and he has collected a variety of facts and observations, which seem to render this hypothesis at least probable. It uniformly appears, that bodies possessing an equal quantity of *phlogiston*, or those of the same kind, as glass or metal, acquire little or no *electricity* by friction; and as the difference in this respect is greater, so much the more *electricity* does the one body acquire from the other; and that those bodies which possess a greater quantity of *phlogiston* give the electric fluid to those that have less of it, or acquire a negative *electricity* when rubbed with such bodies; and that those which have little *phlogiston* acquire *electricity*, or are electrified positively, by the use of the same rubbers. Perhaps we may be allowed to enlarge our views, and consider the sun as the fountain of the electric fluid, and the zodiacal light, the tails of comets, the *Aurora borealis*, lightning, and artificial *electricity*, as its various and not very dissimilar modifications. See to this subject, besides Dr. Priestley's Hist. of *Electricity*, vol. ii. part iii. § 1, 2, 3. Wilson's Essay towards an Explication of the phenomena of *Electricity*, deduced from the Ether of Sir Isaac Newton, p. 5, 1746. Wilson and Hoadley's Obs. &c. p. 55, 1750. Franklin's Essay on the Cause of *Electricity* 1746. Priestley on Air, vol. i. p. 180, 274, &c. Phil. Trans. vol. lxxv. part i. p. 129, &c. and Mr. Eeles's Letters on the same subject.

ELECTRICITY, uniting, is a term introduced by Signior Beccaria, to express a particular phenomenon in this science: if two electrified *electrics* are joined together, they will be found to adhere, and their *electricity* dis-

appear;

appear; but as soon as they are separated, they recover their *electricity*. That, in an experiment of Mr. Lavoisier, first proposed by Mr. Tates, if two glass plates with plates further be laid on one another, and their outward surfaces be coated with tin-foil, and they are then charged, they will adhere very firmly to each other; but if they are separated, that same, whose coating was presented to the prime conductor, in charging, will be positively electrified on both sides; and the other, whose coating was connected with the conductors, communicating with the earth, will be electrified negatively on both sides. If these plates be again laid together and discharged, they will appear, when separated, to be electrified; but the first plate will be negative on both sides, and the second positive. And if they are separated after the discharge in the dark, flashes of light will be seen between their inward surfaces; and these flashes will appear for a considerable time, whenever they are laid together, their coating is touched, and they are again separated; but they will gradually diminish, and at last vanish. Mr. Henry observes, that crown-glass will answer the purpose of this experiment as well as plate-glass, and that Dutch plates, treated in the same manner, and kept a little time before they are separated, will have each a positive and negative surface, and that the electricity of each surface is reversed in the discharge. He adds, that if a glass, dry, uncoated plate of looking-glass be placed between the two first plates, it will appear, after charging, to be negatively electrified on both sides; but if it be placed between the Dutch plates, it acquires, like them, a positive electricity on one surface, and a negative electricity on the other. *Beccaria's Artificial Electricity*, part ii. § 6. Phil. Trans. vol. lxxv. part ii. p. 517, &c. 12. vol. lxxvi. part i. p. 28, &c. See ELECTROPHORUS.

ELECTROMETER, named of *electro*, and *metron*, *measures*, is an instrument contrived for measuring the quantity, and determining the quality of electricity in any electrified body. Mr. Canton, previous to the invention of instruments of this kind, estimated the quantity of electricity in a charged phial, by presenting the phial with one hand to an insulated conductor, and giving it a spark, which he took off with the other; and he proceeded in this manner till the phial was discharged, and then determined the height of the charge by the number of sparks. The most simple *electrometer* is a linen thread, called by Dr. Desaguliers the *thread of trial*, which, if brought near to an electrified body, will be attracted by it; but this will do little more than determine, whether the body is in any degree electrified or not; without determining with any precision its quantity, much less its quality. The able Nollet used two threads, and measured the degree of electricity by the angle of their divergence exhibited in their shadow on a board placed behind them.

Mr. Künig's *Electrometer* is already described under the article *Electrostatic Attraction*.

Mr. Canton's *Electrometer* consists of two balls of cork, or pills of clay, nicely turned in a lathe to about the size of a small pea, and suspended on fine linen threads, about six inches long, which may be wetted in a weak solution of salt. See fig. 26. *Tab. IV. Electricity*. These may be kept in small boxes, of the length of the strings, that they may lie in them without being bent; and they may be thus carried in the pocket and will be ready for use. See *Philos. ELECTROMETER*.

If the box containing these balls be insulated, by placing it on a drinking glass, or any other electric substance, and an excited smooth glass tube be brought near them, they will first be attracted by it, and then repelled both from the glass, and from each other; but on the approach of excited wax, they will be attracted, gradually approach, and come together; and *vice versa*. This apparatus will also serve to determine the electricity of the clouds and air, by holding them at a sufficient distance from buildings, trees, &c. for if the electricity of the clouds or air be positive, their mutual repulsion will increase by the approach of excited glass, or decrease by the approach of amber or sealing-wax; and if negative, their repulsion will be diminished by the approach of excited glass, and increased by amber or sealing-wax. See an account of Mr. Canton's curious experiments with this apparatus in the Phil. Trans. vol. xlviii. part i. part ii.

If two balls of this kind are annexed to a prime conductor, as in fig. 19. *Tab. II. Electricity*, they will serve to determine the degree and quality of its electrification, by their mutual repulsion and divergence. *Electrometers* of this kind may be combined, as in fig. 27. *Tab. IV.* in which D represents a pillar of wax, glass, or baked wood resting on a wooden base A. From the top, project four arms of glass, or of baked wood, supporting four *electrometers*; two of which, D, D, are filken threads, about eight inches long, to each of which a small downy feather is annexed; the other two, C, C, are formed of a stick of glass, as A, about six inches long, covered with sealing-wax, and terminated at the upper end by a

ring, from the lower and are suspended two fine flax threads, &c. about five inches long, each of which has a small cork or pill ball, about an eighth of an inch in diameter. The balls, in the figure, are represented in a state of electrification and repulsion; the plate being annexed to an insulating handle, by which it may be transported, whenever it is used, without the least A. B. Cavallo's *Electr.* p. 164.

ELECTROMETER, the *discharging*, represented in fig. 28. *Tab. III.* was invented by Mr. Lane. It consists of brass work, G, the lower part of which is inclosed in the pillar F, made of wood, baked, and bored in lined oil, and bored cylindrically about two-thirds of its length; the brass work is fixed to the pillar by the screw H, moveable in the groove, so that it may be raised higher or lower, to the height of the jar D requires. Through the brass work is made to pass a steel screw, I, the distance of whole threads is about one twenty-fourth of an inch, to the end of which, and opposite to K, a polished hemispherical piece of brass, fixed to the prime conductor, is fixed a well polished ball of brass, M. To this screw is annexed a circular plate, O, divided into twelve equal parts, and in every revolution of the screw, pointing to the divisions of the scale N: each of which divisions is equal to each turn of the screw. The use of this *electrometer* is to discharge a jar, D, or any battery connected with the prime conductor, without a *discharging rod* (see *Theory of Discharge*); and to give shocks successively of the same degree of strength; and on this account it is particularly adapted for medical purposes. Then, if a person holds a wire, fastened to the screw H in one hand, and another wire fixed to E, a loop of brass wire passing from the frame of the machine to a tin-plate, on which the phial D stands, he will perceive no shock, when K and M are in contact; and the degree of explosion, as well as the quantity of electricity accumulated in the phial, will be regulated by the distance of K and M from each other. Phil. Trans. vol. lxxv. p. 215. The surfaces of the balls, K and M, are very liable to lose their polish by explosion, and in this case the instrument becomes unfit for use. But this is an inconvenience, to which the *quadrant ELECTROMETER* of Mr. Henry is not subject. This instrument consists of a stem C, (fig. 28. *Tab. IV.*) terminating at its lower end with a brass ferrule and screw D, by means of which it may be fixed to a hole in the prime conductor, or to a knob of a jar or battery, or to a stand, as occasion requires; and at its upper end in a ball E. B represents a graduated semicircle of ivory, on the centre of which the index A, being an exceeding light rod, with a cork ball at its extremity, reaching to the brass ferrule of the stem, is made to turn on a pin in the brass piece L, so as to keep near the graduated limb of the semicircle. The stem and index are box, well rounded, and made smooth with emery paper. When the *electrometer* is not electrified, the index hangs parallel to the stem C; but as soon as it begins to be electrified, the index, repelled by the stem, will begin to move along the graduated edge of the semicircle (see E, fig. 4. *Tab. Electricity*), and mark, with the utmost exactness, the degree in which the prime conductor, &c. is electrified, or the height to which the charge of any jar or battery is advanced. This instrument, being made of materials that use very imperfect conductors, will not dissipate the electricity which it receives. Phil. Trans. vol. lxxv. p. 359, &c.

Mr. Henry hath also very much improved Mr. Lane's *electrometer*, by taking away the screw, the double milled nut, and the sharp-edged graduated plate. His improved discharger is made as follows: a spring tube is supported by a socket of brass, which slips upon a supporter of glass. Through the spring tube passes, in an horizontal direction, a thick rod, or tube, of metal, furnished with a ball at each end. Two or three inches, at one end of this tube, are divided into tenths of an inch; and when the instrument is to be used, the ball at one end of the rod is made to touch the end of the spring tube, in which the horizontal rod, or tube, moves, and the ball at the other end of the same rod, or tube, at the same time, touches the prime conductor. The rod being then drawn back to any given distance, the end of the spring tube, through which it passes, cuts the divisions upon the rod, or tube, and shows to the one-tenth of an inch the distance the ball near the conductor has been separated from it, and consequently the length of the space of air through which the charge of electricity is to strike.

Mr. Henry's discharger of this kind has two tubes, one sliding within the other, in order to lengthen, and thus accommodate it to larger apparatus.

The following *ELECTROMETER* was contrived by Mr. Cavallo for observing the electricity of the atmosphere. It consists of a common jointed sliding-rod, A, B, fig. 29. *Tab. IV.* without the ball, or smallest joint. From the extremity of this rod proceeds a slender glass tube C, covered with sealing-wax, and having a cork D at its end,

eng, from which a pitch-ball *electrometer* is suspended. HGL is a piece of twine, fastened to the other end of the rod, and supported at G by a small string FG. At the extremity of the twine L, a pin is fastened, which, when pushed into the cork D, renders the *electrometer* E insulated. In this state the instrument, held by the end A, is projected upwards from an higher window into the air, so as to make an angle of about 50° or 60° with the horizon; and when it has been kept in this situation for a few seconds, the pin is disengaged from the cork D, by pulling the twine at H, which then falls into the situation LK, leaving the *electrometer* insulated and electrified with an electricity contrary to that of the atmosphere. The instrument is withdrawn, and the quality of the electricity examined without any obstruction from wind or darkness.

The same ingenious electrician has contrived a *Rain-Electrometer*, which is a strong glass tube, ABCI, fig. 30, about two feet and a half long, with a tin funnel, DE, cemented to its extremity, and defending part of it from the rain. The tube is covered with sealing-wax from A to B, and also under the funnel. FD is a piece of cane, round which several brass wires are twisted in different directions, so as to catch the rain, without resisting the wind; the cane is fixed into the tube, and a slender wire passes from it through the tube to the strong wire AG, thrust through a piece of cork at the end A of the tube; from a ring at G, at the end of this wire, a pitch-ball *electrometer* is suspended. The instrument is fastened to the side of a window-frame, by strong brass hooks at CB, the part FC is out of the window, and the end F a little elevated above the horizon; the remaining part passes into the room through a hole in a glass of the sash. This instrument is frequently electrified, when it rains, especially by flying showers; and the divergency of the *electrometer* shews the quantity and quality of the electricity it receives. Mr. Cavallo observes, that the rain is generally electrified negatively, and sometimes to such a degree, that he has been able to charge a small coated phial at the wire AG.

Mr. Cavallo has also described a convenient *Pocket Electrometer*. The case of this *electrometer* is a glass tube, fig. 31, and 32. Tab. IV. about three inches long and three-tenths of an inch in diameter, half of which is covered with sealing-wax; to the uncovered end a loop of silk is fixed, which serves for occasionally suspending the *electrometer*; and to the other extremity a cork is adapted, which, by tapering at both ends, may be made to fit the tube with either extremity. From one end of the cork two linen threads proceed, somewhat shorter than the glass tube, and bearing little cones of pitch of elder. When the instrument is used, the cork is inserted in the tube, so that the cones of pitch may hang outward, as in fig. 31. When it is carried in the pocket, the cork slips in, and the cones hang freely within the tube, as in fig. 32. This *electrometer* may be kept in a case, like a common tooth-pick case, fig. 33, closed at one end A, with a piece of amber, which will serve to electrify the instrument negatively; and at the other end with a piece of ivory, fastened to a piece of amber B C; the amber insulates the ivory, which, in this insulated state, by being rubbed against woollen cloths, acquires a positive electricity, and will serve to electrify the *electrometer* positively. Phil. Trans. vol. lxvii. part i. p. 48, &c. part ii. p. 399, or Cavallo's *Electr.* p. 370, &c.

Mr. Cavallo has invented a third *electrometer*, perfectly enclosed in a phial, which is a very curious invention, and very sensible in its operation. For an account of a lately invented *electrometer* by Mr. Brook, see Phil. Trans. vol. lxvii. part ii. p. 384.

ELECTROPHORUS, derived from *ἤλεκτρον*, and *φορέω*, *I bear*, is an instrument, or machine, invented by M. Volta, of Como, near Milan, in Italy, for exhibiting perpetual electricity. This machine consists of two plates, (see fig. 34) one of which, B, is a circular plate of glass, covered on one side with some resinous electric, as bees-wax and resin, or equal parts of resin, shell-lac, and sulphur, and the other, A, is a plate of brass, or a circular board, coated with tin-foil, and furnished with a glass handle I, which may be screwed into its centre by means of a brass or wooden socket. If the plate B be excited by rubbing it with new white flannel, and the plate A be applied to its coated side, a finger, or any other conductor, will receive a spark on touching this plate; and if the plate A be then separated, by means of the handle I, it will be found strongly electrified with an electricity, contrary to that of the plate B. By replacing the plate A, touching it with the finger, and separating it again, it will be found electrified as before, and give a spark to any conductor, attended with a snapping noise; and by this means a coated phial may be charged. The same phenomena may be repeatedly ex-

hibited, without any renewed excitation of the electric plate B. The electric power of B has continued for several days, and even weeks, after excitation, though there is no reason for imagining that it is perpetual. Mr. Cavallo prepares this machine, by coating the glass-plate with sealing-wax; and with a plate of this kind, no more than six inches in diameter, once excited, he has given a charge to a coated phial, which was sufficient to pierce a card; the other plate, separated from it, has emitted strong flashes to the table on which the electric plate rested, and to the surrounding air; and the power has been so strong, that the two plates have adhered together, and the coated glass has been sustained by the upper plate. Instruments of this kind have been made with plates twelve or fifteen inches in diameter, which have afforded a succession of sparks at the distance of three inches or more; and some, five feet in diameter, have given strong sparks at the distance of more than twelve inches.

Mr. Adams, philosophical instrument maker to his majesty, prepares machines of this kind with plates formed from a composition of two parts of shell-lac, and one of Venice turpentine, without any glass plate.

The action of these plates depends on a principle discovered and illustrated by the experiments of Franklin, Canton, Wilcke, and Spina, that an excited electric repels the electricity of another body, brought within its sphere of action, and gives it a contrary electricity. Thus the plate A, touched by a conductor, whilst in contact with the plate B, electrified negatively, will acquire an additional quantity of the electric fluid from the conductor; but if it were in contact with a plate electrified positively, it would part with its electricity to the conductor connected with it. See an account of several curious experiments made with this machine, by Mr. Henly, and Mr. Cavallo, and Dr. Ingenhousz, in the Phil. Trans. vol. lxvi. part ii. p. 513, vol. lxvii. part i. p. 116, &c. and part ii. p. 389, &c. and vol. lxviii. part ii. p. 1027, & p. 1049. See *Fascinating Electricity*.

ELECTRUM is sometimes used for *AMBER*.

ELECTRUM more frequently signifies a mixed metal, of great value among the ancients.

ELECTRUM MINERALE is a name given by some chemists to a metallic mass formed of tin and copper, and martial regulus of antimony, to which gold is sometimes added.

The mass is powdered, and detonated with nitre and charcoal, to a kind of *forma*; then powdered whilst hot, and digested in spirit of wine; whence a tincture of a red colour is obtained, which is esteemed a deobstruent.

ELECTUARY, in *Pharmacy*, a form of medicine, composed of powders and other ingredients, incorporated with some conserve, honey, or syrup; to be divided into doses, like boluses, when taken.

Vossius observes, that all the remedies preferred for the sick, as well as the confections taken by way of regale, were called by the Greeks *μαγνὰτα*, and *μαγνῆται*, of the verb *μαγνῆω*, *I lick*; whence, says he, was formed the Latin *electuarium*, and afterwards *electuarium*. This conjecture he supports from the laws of Sicily, where it is ordained, that *electuaria*, syrups, and other remedies, be prepared after the legal manner. The Hollandists, who relate this etymology, seem to confirm it. Ad. Sancti. Mart. tom. ii. p. 131.

Electuarium are either soft, or solid; and of each kind, some are alterative, others corroborative, others purgative, &c. The *soft* are of the consistence of honey, and may consist of three ounces of powder to a pound of honey, or conserve, and syrup.

The purgatives are usually of the soft kind; but the corroborative only admit of 1, or 1½ ounce of powders, to five or six ounces of conserve, with a proper quantity of syrup. Among the *soft electuaria* of the shops are reckoned lenitive *electuaria*, Venice treacle, mithridate, the confection of hameath, that of alkerkes, the catholicon, diacprunum, diaphenicum, Galen's *hieracium piperis*, &c. which see explained under their respective articles.

Among the solid *electuaria*, are reckoned those of carthamus, rose juice, violet juice, &c. M. Lemery reckons up about a hundred and twenty sorts of *electuaria*, and beside these there is an infinite variety in extemporaneous prescriptions.

To make *electuarium* in perfection, where a syrup is the basis of the composition, as in the *electuaria* of salafra, and the like, the syrup should be prepared in a close vessel, that none of the virtues of the ingredient may be lost; the powders, to be afterwards added to this, should be fresh, and very finely sifted; the gums, when there are any in the composition, should be well cleaned, and dissolved in their proper menstrua; and the whole must be reduced to a smooth mass, of such a consistence, as will neither be subject to candy nor ferment.

Where syrups are used only to bring *electuarium* into form,

care must be taken that they are not boiled too high; for that will subject them to canker in the *chellury*, and spoil the whole, as the being too low boiled, or thin, will leave them subject to ferment in hot weather, and afterwards grow sour, so as to change, invert, or destroy the nature of the medicine.

Electuaries made of the pulp of fruits, are less disposed to keep than others, on account of the great tendency these subjects have to ferment and putrefy. Hence a leavener *chellury* can never keep long, especially if made too thin.

Just the contrary of this is the case, however, with the capital *chelluries*, as Venice treacle, mithridate, and the like; for these require to be some time made, that the ingredients may digest or ripen, as it were, and grow mellow together, as the gums and spices that are in that composition keep it from any decay, provided the honey doth not candy, which some prevent by using it unclarified; and if these *chelluries* prove too dry, they are to be moistened with Canary wine, and thus they improve by keeping. This, however, is not the case with the *chelluries*, which lose of its stringency as the ingredients become mellow together; and this is much better made up with sugar of roses, or syrup of diacodium, instead of honey. Shaw's *Lectures*, p. 209.

The way of powdering and sifting the ingredients for *chelluries* is liable to lose their finer and lighter parts, in form of a light dust, and that of grinding them in a mortar has the same inconvenience, with the addition of a great quantity of stony matter mixing itself from the mill-stones with the powder. The best way would certainly be, by means of two iron rollers moving against one another in a close box, as in the making of chocolate, and to grind together all the ingredients, with the honey and wine, and bringing all at once to a proper consistence. Perhaps, indeed, a much better way than all, though a very troublesome one, would be to get out the full virtues of all the ingredients separately, in the form of extracts and essential oils, &c. and mix these with a proper quantity of honey, and, by this means, to concentrate the medicine, so that it might be given agreeably in very small doses.

ELECTUARY *Electuarius*, a new name given, in the London Pharmacopoeia, to the composition commonly called *chellurian* or *chellurianum*. The composition is also to much altered, that instead of an ounce, a dram and a half is now a common dose. The prescription for it is this: take scammony, an ounce and a half; cloves and ginger, of each six drams; oil of caraway seeds, half a dram; honey, half a pound; mix all into an *electuary*. Pomeroy's *London Disp.* p. 336.

ELECTUARY for the *Dysenteria*, for the *Epilepsy*, for the *Gonorrhoea*, for the *Piles*, for the *Pelvis*, for the *Rheumatism*. See *DRACONTIA*, *EMULSION*, *GONORRHOEA*, *HÆMORRHOIDS*, *PALSY*, and *RHEUMATISM*.

ELEEMOSYNA *Corporum*, or *pro Aratro*, or *Aratri*, in our *Sacred Constitutions*, a penny which King Edward ordered to be paid for every plough in England, towards the support of the poor. Sometimes it is also called *eleemosyna regis*, because first appointed by the king.

ELLEMOYNA is also used for the possessions belonging to churches. See *ALMS*, and *FRANK ALMOSYNA*.

ELEEMOSYNARIA. See *ALMS*.

ELEEMOSYNARIUS, in our *Old Writers*, is used for the almoner, or peculiar officer who received the eleemosynary rents and gifts, and distributed them to pious and charitable uses. There was such an officer in all religious houses. The bishops also used to have their almoners, as now the king has. *Linn. Provinc. lib. i. tit. 12*. See also Du Cange, *Gloss. Lat.*

ELEEMOSYNARY *Corporation*. See *CORPORATIONS*.

ELEGANCE, **ELEGANCY**, from *eligi*, *I chose*, denotes a manner of doing, or saying things politely, agreeably, and with choice.

With choice, so as to rise above the common manners; politely, so as to strike people of delicate taste; and agreeably, so as to diffuse a relish which gratifies every body.

ELEGANCE, in *Oratory*, is one of the three parts of general elocution, and respects the purity and perspicuity of the language. By the former a discourse is rendered correct, and by the latter intelligible; and both extend to the selection of single words, as well as to their construction in sentences. See *PURITY*, and *PERSPICUITY*.

Poetical *elegance*, *elegancia poetica*, are of service to scholars in making their verses; by being too regular in the grammatical construction, we lose certain licences, wherein the *elegance* of language consists. *Elegance*, though irregular, is better than regularity without *elegance*.

The *elegance* of a painting is not founded on the correctness of the design, as appears in Raphael, and the an-

tique. It is most felt in works otherwise careless and inaccurate; as in Correggio, where, in spite of all the defects as to justness of design, there is an *elegance* even in the manner of the design itself, as well as in the ease of the attitudes, &c.

The *elegance* of a design is a manner which embellishes and heightens objects, either as to their form, or colour, or both; without destroying or perverting the truth.

ELEGIA, in *History*, a name given, by some authors, to the *aranda scriptura*, or *writing read*, common in Greece and Italy.

ELEGIAC, in the *Latin Poetry*, something that belongs to *elegy*.

Elegiac verses, *Elegiacs*, are alternately hexameters, and pentameters.

Quintilian esteems Tibullus the chief of the *elegiac poets*; but the younger Pliny gives the preference to Propertius. They have each of them reason on their side; and one might make a third choice, as just as either of them. See *ELEGY*.

ELEGIT, in *Law*, a judicial writ, given by the statute *Westm. 2. c. 13* *Edw. 1. cap. 18*, which lies for him who has recovered debt or damages, or upon a recognisance in any court, against one not able in his goods to satisfy, and directed to the Sheriff, commanding him to make delivery of half the party's lands, and all his goods, oxen and beasts for the plough excepted.

This writ should be sued out within a year and a day after the judgment.

The creditor shall hold the moiety of the said land so delivered to him, till his whole debt and damages are satisfied; and during that time he is tenant by *elegit*. See *TENANT*.

ELEGY, *Elegia*, a mournful, and plaintive kind of poem. Voellus, after Didymus, derives the term from *ἐλεγειν*, *to grieve*, *to lament*.

The first inventor of the *elegy* is not known: some say it was one Theocritus of Naxos, or, according to others, of Eretria, who, in the heat of his plenty, first produced this kind of composition. But there is no wonder that we are at this time in the dark as to the matter; Heracle assures us it was a point not settled among the grammarians even in his time, who the author was.

*Quis tamen exiguus elegos emiserit autor,
Grammatici certant, et adhibe sub judice lit.*

The chief writers of *elegy* among the Greeks, are Callimachus, Parthenius, and Euphorion; and among the Latins, Ovid, Catullus, Tibullus, and Propertius.

The Flemish have distinguished themselves among the moderns for this kind of Latin verse. The *elegy* of Bidermann, Grotius, and especially Scedonius and Valles, seem worthy of the purest antiquity. The contents of la Suse has distinguished herself for *elegy* in the French tongue.

In the English, we have nothing considerable of the *elegiac* kind, but what we have in Milton. The English and French *elegy* are chiefly in Alexandrine verses.

In process of time, *elegy* degenerated from its original intention; and not only matters of grief, but also joy, wishes, prayers, expostulations, reproaches, and almost every subject, were admitted into *elegy*.

The office of *elegy* is well delivered by M. Boileau:

*La plaintive elegie en long habito de deuil,
Sépult, les croceux noirs, gémir sur un cercueil;
Elle peint des amans le joy, & la tristesse;
Flatte, menace, irrite, oppose une main forte.*

In mourning weeds sad *elegy* appears,

Her hair dishevelled, and her eyes in tears:

Her theme, the lover's joys, but more his pains;

By turns she flings, soothes, threatens, and complains.

The diction of *elegy* ought to be clean, easy, perspicuous, expressive of the manners, tender, and pathetic; not oppressed with sentences, points, &c. No apostrophes are allowed; and the sense ought to be generally closed in every dithyramb, or two lines; at least, in Latin compositions.

ELEMENTARY, something that relates to the principles or elements of bodies.

The elements of a body are also called the *elementary principles* thereof. See *PRINCIPLE*.

The whole space, included within the concave, or orbit of the moon, is called the *elementary region*, as being the seat, or sphere, of the four vulgar elements, and the bodies compounded thereof.

The author of the *Comte de Gabalis* gives the name *elementary people* to a kind of beings who are supposed to inhabit the elements, and are only known by what they call the *philosophers*, or *sages*. According to these persons, the element of fire is inhabited by salamanders; water, that is, the

the sea and rivers, by nymphs, or oridians; earth by gnomes and gnomides; and air by sylphs and sylphides. ELEMENTARY Air, Fire, Geometry, Music. See the sub-antiva.

ELEMENTS, in *Physics*, the first principles or ingredients of things, whereof all bodies are compounded; and into which they are all resolvable.

Elements are conceived as the most simple, homogeneous parts or corpuscles; of an adscitible and mixture whereof, all the bodies we see, consist.

Authors generally talk wildly, and inconsistently, of the elements, and confound them with the principles of things, yet there is great difference; and we find by experience, that all things cannot indifferently be made of all; that stones, for instance, and marble are not convertible into flesh, nor are fit to nourish or augment an animal body; it seems to follow, that all the variety of bodies could never arise from the first simple combination of the two principles, matter and form; but only some infinitely simple beings, or corpuscles, which being variously intermixed, might constitute all other bodies. Now these most simple of all beings, thus formed of the first determination and concretion of principles, are what the philosophers properly call elements; so that elements and principles have this difference between them, that a principle, as matter, is a kind of incomplete nature; but an element is a perfect or complete one.

Hence it follows, that there must, of necessity, be more elements than one; since otherwise all things would be equally simple, and there would be no such thing as a compound in nature. Most of the ancients, not aware of this, confound element with principle; by which means the elements are sometimes represented as corruptible, and sometimes as incorruptible. The reasoners to incorruptible elements, mean precisely by element what we mean by the first matter. In effect, their elements are their atoms, or corpuscles, which are supposed indivisible, incorruptible, &c.

Democritus is held to have been the first author of this tenet; which accordingly is adhered to by Epicurus, and many of their descendants, the Epicurean and corpulent philosophers. Among those who hold the elements corruptible, some will only have one, and some several. Of the former, the principal are Heraclitus, who held fire; Anaximenes, air; Thales Milesius, water; and Hesiod, earth; as the only element. Hesiod is followed by Bernardus, Telesius; and Thales, by many of the chemists.

Among those who admit several corruptible elements, the principal are the Peripatetics; who, after their master Aristotle, contend for four elements; viz. fire, air, water, and earth. Aristotle took the notion from Hippocrates; Hippocrates from Pythagoras; and Pythagoras from Ocellus Lucanus, who seems to be the first author of the dogma.

The Cartesianists only admit three elements; which they pretend are all that could arise from the first division of matter. See CARTESIAN Philosophy.

Our great Sir Isaac Newton considers the primary elements of bodies on the atomical system; thus, all things considered, it seems probable, that God in the beginning formed matter in solid, massive, hard, impenetrable, moveable particles, of such sizes and figures, and with such other properties, and in such proportion to space, as most conduced to the end for which he formed them; and that these primitive particles, being solid, are incomparably harder than any porous bodies compounded of them; even to very hard as never to wear out; no ordinary power being able to divide what God made one in the first creation. While the particles remain entire, they may compose bodies of one and the same nature and texture in all ages; but should they wear away, or break in pieces, the nature of things, depending on them, would be changed; water and earth, composed of old worn particles, and fragments of particles, would not be of the same nature and texture now, with water and earth composed of entire particles in the beginning. And, therefore, that things may be lasting, the changes of corporeal things are to be placed only in the various separations, and new associations and motions, of those permanent particles; compound bodies being apt to break not in the midst of solid particles, but where those particles are laid together, and only touch in a few points. It seems to him likewise, that these particles have not only a *vis inertiae*, with the passive laws of motion regulating therefrom, but are also moved by certain active principles; such as gravity, and that which causes fermentation, and the cohezion of bodies. See COHEZION, EARTH, FERMENTATION, GRAVITY, and PRINCIPLE.

ELEMENTS, in *Chemistry*, are the principles, or component parts, of natural bodies, into which they are resolvable by fire, &c.

The effect of chemistry is, to analyse or resolve bodies into their elements.

The chemical elements are divided into active and passive. The chemists are somewhat divided as to their elements. Some to the vulgar Peripatetic elements, water, which they call phlegm; and earth, which they call *caput mortuum*, add three more; viz. salt, sulphur, and mercury. Salt they hold the principle of taste; and sulphur, of smell and inflammability; as to mercury, which they also call spirit, some hold it the principle of colours, but others deny this; and, in effect, they agree in nothing, but that it is the most subtil and spirituous part.

Other chemists consider fire, air, water, and earth, as the only proper elements, or simple bodies; alleging, that by the most complete and accurate analyses which have been made, nothing has been ever ultimately produced but from one or more of these four substances, according to the nature of the decomposed bodies; and that they really act as such in all chemical operations. Macquer.

The elements of fossils are, 1. Mercury, as the base. 2. Sulphur, as the coagulator, or binder. 3. Salt. 4. Earth. The elements of metals, are sulphur and mercury alone; mercury as the base, or matter, and sulphur as the binder, or cement. The elements of fossil salts are an acid spirit, and insipid earth. The elements of earths are an oil, a little acid salt, and a calx. The elements of sulphurs are an acid spirit, an oil, and an earthy or metallic matter. Boerhaave.

But, after all, it must be added, that there is no assigning any precise number of chemical elements; some bodies yielding more, and others less. And ever these very elements themselves are reducible, by a further process, into other elements. Thus, by repeated distillations of wine, we successively get a spirit of wine, a rapid water, a fusid water, a more acid water, oil, bitter yellow spirit, and a *caput mortuum*, which is resolvable into earth, oil, &c. Now, are these so many several elements? Add, that what they account an element, now that it is separated, is very different from what it was when it existed in the mixt; as appears hence, that upon returning all the elements a body is resolved into, the mixture will bear no resemblance to the first body.

In effect, these elements seem rather to be produced by the fire, than separated by it. Beside, that they are convertible, or at least resolvable, into one another. Thus spirit of wine is found to yield an acid, an oil, and a water; and salts yield either an acid, or an alkali, with phlegm. What makes the notion of the chemical elements still more precarious, is, that a pot-herb and a poisonous herb, shall sometimes yield elements perfectly alike; more so, than the same plant analysed at two different times. M. Homberg has considered the difficulties charged on elements with great attention.

The result of numerous experiments made to ascertain the matter is, that the four principles, salt, oil, water, and earth, are always found in all plants, in what manner soever analysed; that these principles are more or less volatile, or fixed, according to the different manners of analysing; that this difference arises, not only from the different force of fire, but also from the fermentation of the mixt, preceding the analysis; that a vehement fire rendering different elements equally volatile, confounds them in the analysis; that the fire evaporates, and absolutely loses several parts; and that to have the elements as pure as may be, only fermentation, and a gentle fire, must be used.

ELEMENTS are also used, figuratively, for the grounds and principles of arts and sciences.

Thus we say, letters are the elements of speech; he does not know the first elements of grammar.

The ELEMENTS of mathematics have been delivered by several authors in their courses, systems, &c. The first work of this kind is that of Peter Herigon, in Latin and French, published in 1664, in ten tomes; wherein are contained the elements of Euclid, Euclid's Data, Apollonius Pergaeus, &c. with the elements of arithmetic, algebra, trigonometry, architecture, geography, navigation, optics, spherics, astronomy, music, perspective, &c. The work is remarkable for this, that, throughout, a kind of real and universal characters are used; so that the demonstrations may be understood by such as only remember the characters, without any dependence on language or words at all.

Since Herigon, the elements of the several parts of mathematics have been laid down by others, particularly the Jesuit Schottus, in his *Corpus Mathematicum*, in 1674. Sir Jonas Moore, in his *New System of Mathematica*, in 1681; De Chales, in 1674; Ozanam, in his *Cours de Mathématique*, in 1699; and, above all, Christ. Wolfius, in his *Elementa Matheseos Universae*, in two vols. 4to. the first published in 1713, and the second in 1715; a work

a work never enough to be commended. There has been another edition of this excellent work published at Geneva, in five volumes in quarto; the first volume in 1732, the second in 1733, the third in 1735, the fourth in 1738, and the fifth in 1741.

The *Elements* of Euclid are the first and best system of geometry. We have abundance of editions and comments on the fifteen books of Euclid's *Elements*. Oronzio Pinco first published the first six books in 1530, with notes, to explain Euclid's sense. The like did Pictorius in 1557. Nic. Tartaglia made a comment on all the fifteen books about the same time, with the addition of some things of his own; and the like did Fran. Florinus Candelas, a noble Frenchman, in the year 1558, with considerable additions, as to the comparison and inscriptions of solid bodies; which work was afterwards republished, with a prolix comment, by Clavius, whose edition has since been reprinted, at various places and times.

Dr. Gregory published an edition of all Euclid's works, including his *Elements*, in Greek and Latin, in 1703, folio. But as the whole library books do not seem necessary, especially for young mathematicians, some authors have chosen only the first six, with the eleventh and twelfth at most. It would be endless to relate the several editions thereof; there is a French one of Dr. Chales, and a Latin one of And. Tacquet, the best edition of the former of which, is that of Paris in 1709, by Orsani; and of the latter, that of Cambridge in 1703, by Mr. Whiston. Mr. T. Simpson's *Elements* of Geometry is an excellent compendium of this kind; and Dr. Simpson of Glasgow published in 1756, a Latin edition of the six first, and eleventh and twelfth books of Euclid, with notes.

ELEMENTS, in the *Higher Geometry*, are the infinitely small parts, or differentials, of a right line, curve, surface, or solid. Thus, (*Tab. Analysis*, fig. 18.) the small space PMmp, formed by the two ordinates PM, pm infinitely near each other, and the arc Mm of the curve, is the element of the space APM, Pp is the element of the abscissa AP, Mm that of the curve AM, &c. See DIFFERENTIAL, FLUXION, &c.

ELEMENTS, in *Astronomy*, are those principles deduced from astronomical observations and calculations, and those fundamental numbers, which are employed in the constructions of tables of the planetary motions. Thus, the elements of the theory of the sun, or rather of the earth, are his mean motion and eccentricity, and the motion of the apogee. The elements of the theory of the moon are its mean motion, that of its node and apogee, its eccentricity, the inclination of its orbit to the plane of the ecliptic, &c.

ELEMI, or **ELERY**, in *Pharmacy*, a pellucid resin, of a whitish colour, intermixed with yellowish particles, and often much of the colour and consistence of wax; of a pretty brisk bitter, though not disagreeable taste; and a smell somewhat like that of fennel.

It is usually called *gum elemi*, though very improperly, inasmuch as it is a resin, and readily engrossed, and dissolves in oleaginous liquors, which are the characters of a resin, not a gum. It totally dissolves in redified spirit of wine, and in distillation with water, fifteen ounces of gum yield one ounce of essential oil. It flows from incisions made in the trunk and large branches of a large and tall tree, of the olive kind, growing in Ethiopia, and Arabia Felix. It is also found in Apulia, a province in the kingdom of Naples.

Pomet in his *Hist. and Lemery* in his *Dictionary of Drugs*, describe *elemi* as a white resin, bordering on green, odoriferous, and brought from Ethiopia, in cakes of two or three pounds a-piece, and usually wrapped up in the leaves of the Indian cane.

It is excellent in difficulties of the head; and is proper to digest, resolve, and suppurate. It is held a kind of natural balsam; and is sovereign in the cure of all sorts of wounds.

One of the best officinal digestives, commonly called the ointment or liniment of Arcæus, consists of six parts of the *elemi*, five or six of turpentine, and twelve of lard, or a mixture of lard and tallow melted together.

The true *gum elemi* is that above described; but there are several spurious sorts, some natural, and others factitious, frequently sold for it.

The factitious, or counterfeit, is usually made of resin washed in oil of spike: though the ill smell, and white colour of this might easily discover the fraud. The natural gums, obtained for *elemi*, are,

1. A gum brought from the American islands, in cogs of different weights, covered up with the leaves of a plant unknown in Europe.

The second may be taken for common resin, but for its smell, which is somewhat fetid, and more aromatic. The third is of an ash colour, bordering on brown, brought over in large pieces, and very dry and friable.

Pomet does not take any of these for different genuine gums, but rather supposes them to be originally resin, only impure, and coarse, since melted down, and made up by the fire.

ELENCHUS, in *Antiquity*, a kind of ear-rings set with large pearls.

ELENCHUS, *Elenchus*, in *Logic*, by the Latins called *argumentum*, and *inquiritio*, is a vicious or fallacious argument, which deceives under the appearance of a truth, the same with what is otherwise called *sophism*.

ELEOCARPUS, in *History*. See **ELIOCARPUS**.

ELEOSACCHARUM, rather **ELIOSACCHARON**, *Eleosaccharon*, in *Pharmacy*, a mixture of sugar with a distilled oil, in order to bring it to mix with some aqueous fluid for present use.

Grind an ounce of fine and dry sugar to an impalpable powder, in a glass mortar, with a glass pestle; then add to it, by degrees, a dram of any essential oil, or half a dram; if the oil be very tenacious; continue rubbing them together till the oil be thoroughly mixed, and drain into the sugar. The oil, in this operation, usually diffuses a fragrance to a great distance; wherefore to prevent the loss of its finer parts, the operation should be performed as quick as possible, and the mortar covered, and the pestle surrounded by a clean linen cloth; and if a little quantity of the white of an egg be added in the grinding, and mixed in with the sugar and oil, the oil thus becomes more easily miscible, but the mixture will not keep so long without growing rancid. Toss sugar, which is a pure soap, or a true essential oil salt, divides the glutinous tenacity of the oil, interposes itself between the principles thereof, unites them closely with itself, and makes an extemporaneous soap, which may be commodiously diluted with water for medicinal uses. Though this mixture is not so perfect as an actual soap, or true essential salt, yet it suffices for use; nor is there reason to apprehend any inconvenience from the sugar in this preparation; for sugar is unjustly said to be unwholesome, as there are no solid proofs extant of this; on the contrary, it is a wonderful salt that perfectly mixes with water, and ferments therewith into wine, and yet, what is surprising, it appears oleaginous and perfectly inflammable in the fire, whence it is known to consist of oil and salt.

If these *eleosaccharum* be carefully prepared, and put up in clean dry glasses, exactly closed with glass stoppers, they may be preserved perfect a long time; and in this manner very effectual medicines may be easily carried from place to place, and, upon occasion, directly used upon a journey, by mixing a small quantity of them in a glass of wine. An *eleosaccharum*, or mixture of the same nature, at least, might be also made, by mixing an essential oil with a fixed alkaline salt, by grinding, by which means also a kind of soap is obtained; but alkalies, thus mixed, destroy the grateful properties of the essential oils, and change their natural taste and odours. Such mixtures also would presently resolve in the air, and thence be easily altered; but, by the method with sugar, the physicians may always readily prepare a medicine rich in virtues. If the *eleosaccharum* of mint, for instance, be dissolved in mint water, then strengthened with an addition of spirit of mint, and the mixture sweetened with syrup of mint, the whole virtues of the plant will be thus obtained. Boerh. Chem. part ii. p. 100.

ELEOSELINUM, in *Botany*, a name by which some authors have called the paludarium or snailage. Ger. Emac. Ind. 2.

ELEPHANT, *Elephas*, in the Linnaean system of Zoology, the name of a distinct genus of the *bruta*, in the class of *mammalia*. The characters which make the distinction of this genus, are, that the elephant has no *dentes incisores*, or cutting-teeth, and that the *canines*, or dog-teeth, of the upper-jaw are very long; that it has a very long, flexible proboscis, and almost naked body. The proboscis is a long cartilaginous trunk, formed of many rings, and terminated with a small moveable hook. This trunk serves the animal instead of a hand, to convey any thing into the mouth, and to defend it from its enemies; the nostrils are at the end of the proboscis, which is the organ of feeling and of smell, both which senses the elephant possesses in a very exquisite degree. Besides the proboscis, the elephant has two large tusks projecting from the upper-jaw, and bending a little upwards. The largest of those imported into England are seven feet long, and weigh a hundred and fifty-two pounds each. The eyes of this animal are small, its ears large and pendulous; the back is arched; the lips are thick and clumsy; the neck short; the feet are round and undivided, but terminated at their margins with five small hoofs. The knees are flexible; it has two paps on the breast; the tail resembles that of a hog, and the skin is very thick and callous, and, when dressed, impenetrable by

or a snuff-bell, of a dusky colour, and has a few feathered hairs on it. The elephant is the largest of all land animals, and is said to be twelve or even fifteen feet high. See Tab. Quadrupeds, fig. 2.

Elephants are found both in Asia and Africa; but those of Asia are the largest, though they are much more numerous in Africa. They are said to go a year with young, and to bring forth one at a time; they live, according to Tavernier, in his Voyages, a hundred and twenty or a hundred and thirty years, and are thirty years before they attain their full growth. The elephant, notwithstanding its enormous size, is exceedingly swift, and so strong, that, after being tamed, they have been employed to carry pieces of artillery, small towers, with a number of people in them, and also vast loads. The Indians have from very early times employed them in their wars; Poros, as Quintus Curtius informs us, lib. viii. cap. 41. opposed the passage of Alexander over the Hydaspes, with eighty-five of these animals; and M. de Baulon apprehends, that some of the elephants taken by that monarch, and afterwards transported into Greece, were employed by Perseus against the Romans. The elephant, notwithstanding its size and strength, is the most docile and tractable of all animals. Naturalists relate many instances in which they have discovered a sensibility of benefits, a resentment of injuries, a modesty, and an ambition, of a very surprising degree.

The figure of an elephant is found on many of the ancient medals. Julius Cæsar, towards the end of the Roman republic, being prohibited from putting the figure of his own head on their coin, substituted that of the elephant; thus flattering his ambition by a very trivial circumstance; as in the Punic language, *Elephas* signified an elephant. The elephant was afterwards used as a symbol of foreign power, of eternity, and of piety towards the Deity.

Elephant's taming. The method of taking and taming this creature, in the island of Ceylon, is as follows: the natives pitch upon a proper place for a warren, or park, which is broad at the entrance, and grows narrower farther in, till, at the end, it is so narrow, that an elephant cannot turn himself, and it runs on of this narrowness so far, that twenty elephants may stand in it one behind another. When the inclosure of this warren is finished, all the people of the neighbouring places assemble, and make a circumference round the woods, where they know there are elephants, which takes in, perhaps, sixty miles. The men now stand at twenty-five yards distance, and kindle fires between them, and make all the noise they can, by blowing, blowing horns, beating drums, and the like, and, by degrees, approach nearer and nearer the warren. The elephants run from the fires and noise, and consequently can go no where but towards the warren; the men, who every where surround them, except on the warren side, follow upon them in this manner, till they come together, and make a ring, and the elephants are driven into the inclosure. When these creatures perceive that they are thus taken, they make resistance, and often run upon the men; but there are always near the warren fences of poles, lying flat upon the ground, which the hunters need only raise up, and they keep in the prey, so that they can neither escape, nor injure them: they then pursue the elephants with firebrands, and drive them into the narrow part, where they cannot turn.

There are, from this place, taken one by one, and led to the stable, each between two tame elephants bred for that purpose, the points of whose long teeth are cut; and there, if the wild elephant be troublesome, will lay hold of his trunk with theirs, and beat him with their teeth. A man, sitting upon each of the tame elephants, directs them by a staff with a hook at the end, with which he occasionally touches their heads, and orders them as he pleases, without bridle, or any other furniture. When they are brought into the stable, they are led between two posts, with halles put ahead before their breasts, and under their bellies, and are so tied, that they cannot stir, nor lie down upon the ground; for, if permitted to lie down, they would become sorrowful, and refuse to eat, and would die. They are here fed with the trunks of plantains, a food they much delight in, and when they have been kept thus about six weeks, they become tame enough for sale. If not sold at that time, they feed them about six weeks longer in the stable with cocoa leaves, and they are, at the end of that time, perfectly tame as a mule, and will eat grass with the oxen in the fields. Phil. Trans. N.º 272. § 1.

The elephants of Ceylon have been so long hunted, that they now know men for their mortal enemy, and seldom fail to seize upon and kill him wherever they meet him; but if a man lie upon the ground, and pretend to be dead, they never meddle with him. Several people have

in this island, lain asleep while elephants passed by them, and some have only pretended sleep, and a perfect stillness has always been found to preserve them, even though the creature came up to examine them.

Elephant. *Elephas*, gives the denomination to an ancient and honourable military order, conferred by the kings of Denmark on some best persons of the highest quality, and extraordinary merit.

It is called the *order of the Elephant*, from its badge, which is an elephant, with a castle on its back, set with diamonds, and hung on a watery sky coloured ribbon, like the George in England.

There are different sentiments as to the origin and institution of this order; the first is that of Hoenning and Hoenningius, who attribute it to Christian IV. who was elected king in 1584. The second, that of Selden and Imhof, who derive it from Frederic II. elected in 1547. Gregorio Len goes back as far as Frederic I. who reigned about the year 1530. Bernard Robolinus will have king John to be the author, who began to reign in 1478. Antichimus, Rolfeus, and Loelcher, hold it to have had its rise under Christian I. father of Frederic I. Lastly, Voeglius, Becman, and Niecherodius, maintain Cæsar VI. to have been the first institutor; and the occasion thereof to have been the crusades. This prince, according to the chronology of Swaving, reigned towards the close of the twelfth century, from the year 1168, to 1191. This, at least, we are certain of, that the order was instituted in the year 1595, there being a painting full of it, done that year, by count Reinden, a knight of this order. And we have even authentic evidences of the marriage of Mantua, being created knight of the same order, by Christian I. in 1574. There are bulls of pope Pius II. and Sixtus IV. confirming the statutes of the order, authorizing the holding of assemblies, or chapters, in the chapel of Roschild, and setting the privileges of the knights.

The order, was at first called the *order of St. Mary, wife of St. Mary*; though it seems to have had the appellation of the elephant as early as Christian I. who is the figure of an elephant to often struck on his coins, medals, &c.

The manner of its institution is thus related; king Cæsar having sent a fleet against the Saracens in 1189, which took Sidania and Ptolemais, a protestant among the Danish cruises killed an elephant; in memory of which extraordinary accident the order was erected. This account is rendered the more probable by this; that it is referred to an era, when nothing was more common than to take the spoils of a vanquished enemy for armories or cognizances; and accordingly, some of the principal arms of the like kind now on foot, e. g. the lions of the Low-Countries, had their rise at the time of the crusades, as is shown by Heuterius and Hoenningius; which circumstances greatly corroborate the opinion of those who ascribe the order to king Cæsar.

To the collar of the order hangs an elephant, with a silver turret on its back; and underneath the elephant, an image of the Holy Virgin, interceding with *Immaculata*. See the abbot Jollinani, *Hist. de tutti gli Ord. Milit. e Caval.* tom. II. cap. 72.

The chapel of Roschild was founded by Christian I. for the assemblies or chapters of this order to be held in. It was first called the *Chapel of the Three Kings*; *Capella Trium Regum*; afterwards Frederic I. gave it the name of the *Royal Chapel*.

The order was reformed by Frederic II. who created abundance of knights at the ceremony of his coronation, which is the only time when the Danish kings make any knights of the *Elephant*. Christian V. augmented and enriched it very considerably. In the year 1604 a grand chapter of the order was held at Frederichsborg, in the chapel of the knights, wherein six German princes were admitted into the order.

We have a multitude of writings on the subject of this order, whosoever that of Janus Burchardus may serve for all the rest; it is the best, most ample, and learned. It was published at Copenhagen in 1705, under the title of *Breviarium Equestris, seu de Illustrissimo, & Insublimissimo Ordine Elephantino, &c.*

Elephant's tusk. Many teeth and bones of animals have been found in a fossil state, both in Siberia, and on the banks of the Ohio, in North America. The French academicians, on comparing some of these with the bones of real elephants, determined, that they belonged to the same species of animal; but Dr. Hunter has discovered, on a more accurate examination, that they are very different from those of the elephant, and belong to another animal. The tusks of the true elephant have a slight lateral bend; but those brought from America have a larger twist, or spiral curve, towards the smaller end; the grinders of the latter are made like those

those of a carnivorous animal, being furnished with a double row of high and conic processes, as if designed to masticate, and not to grind its food; whereas, those of the elephant are flat, and ribbed transversely on their surface; besides, the thigh bone is of a very disproportionate thickness to that of the elephant, and has some other anatomical variations. And though the American tulks, when cut and polished by the workmen in ivory, did not differ in texture and appearance from the true ivory, Dr Hunter concludes, that genuine ivory must be the production of two different animals, and not of the elephant alone; and that the animal to which these bones belonged may be the supposed elephant or mammoth of Siberia, and other parts of the world, which is yet unknown. Phil. Trans. vol. viii. art. 5.

Elephant's foot, in Batavia. See ELEPHANTOPUS.

Elephant's head, in Batavia, a species of the rhinoceros. See LOBOWORT.

Elephant-scorpion, a name given by some authors to a species of insects, commonly known in Ireland by the name of Cane-worm, and supposed to be poisonous to cattle which feed on it. See Cane-worm.

Elephant's nose, or elephant's snail, as it is called by the Dutch, is a species of the acur or needle-fish, caught in the East Indies, so called from the resemblance of its snout to the trunk of an elephant. It is a very singular species, the lower jaw running out into a very long and sharp-pointed spine, it is round-bodied, and beautifully variegated with spots, and has on each side a green line running from head to tail. It is caught in salt-water. Ray's Ichthyogr. app. p. 4.

Elephant, river, see HYPOPHANTAS.

Elephantiasis, in Aethiopia, a kind of leprosy, called also *lepra Arabum*, in contradistinction to the *lepra Græcorum*, which is another disease.

The *elephantiasis* is thus denominated, because those seized therewith have their arms and legs big swollen, and tumorous; the skin bloated, yet rough to the touch, and all wrinkled and rugose like the skin of an elephant.

The *elephantiasis* is a disease unknown in our parts of the world, at least in these days. Some authors call it *elephantiasis*, and others *faturnia*. The Greeks call it *exopiasia*, and sometimes *lepra*, *elephant*; also *exopiasia* and *exoparagria*. The *elephantiasis Græcorum*, or *lepra Arabum*, is described by Dioscorides as a contagious disease, infecting the body with a variety of evils.

In the *lepra Arabum*, the skin is beset with a dry scabby crust: as in the former case the salts, being left deliquescent of their humidity, are not so active, and therefore affect only the cuticle; in the latter case these salts, with their vehicle, crowding faster than they can be evaporated through the pores of the skin (being still in force, and so more caustic) corrode deeper, and cut not only the cuticle, but the excretory vessels, and surface of the skin itself, which thereby exudes a liquor somewhat thicker than usual; which, when the thinnest and most aqueous parts are evaporated, are condensed into that crust or scab, which is the distinguishing character of this disease.

Galen defines the *lepra*, an effusion of thick disorderly blood, that corrupts the whole habit of the body. Avicenna calls it an *arterial cancer*.

The *lepra* always begins within-side, a long time before it appears without-side. It was frequent in Europe in the tenth and eleventh centuries, but seems at present almost extinct: unless we allow the venereal disease to be the same with the *lepra*, as was the opinion, among many others, of the learned Pitcairns; and has been lately endeavoured to be proved by Mr. Becker, in a discourse expressly on the subject, in the Philosophical Transactions.

The symptoms of the ancient *lepra*, as laid down by Galen, Aretæus, Pontanus, Ægineta, Cardan, Varado, Gordon, Phaetius, and others, are as follow: the patient's voice is hoarse, and comes rather through the nose than the mouth; the blood is full of little white shining bodies, like grains of millet, which, upon filtration, separate themselves from it; the serum is scabious, and deliquescent of its natural humidity, inasmuch, that salt applied to it does not dissolve; it is so dry, that vinegar poured on it boils; and is so strongly bound together, by little imperceptible threads, that calcined lead thrown into it swims. The face resembles a coal half extinct, unclouded, shining, and bloated, with frequent hard knobs, green at bottom, and white at top. The hair is short, stiff, and brinded, and not to be torn off without bringing away some of the rotten flesh to which it adheres: if it grows again, either on the head or chin, it is always white. Atward the forehead run large wrinkles or furrows, from one temple to the other; the eyes are red, and inflamed, and shine like those of a

cat; the ears swollen, and red, eaten with ulcers towards the bottom, and encompassed with little glands; the nose sunk, because of the rotting of the cartilage; the tongue dry, and black, swollen, ulcerated, divided with furrows, and spotted with grains of white; the skin covered with ulcers, that die and revive on each other, or with white spots or scales, like a fish; it is rough, and insensible, and when cut, instead of blood, yields a limpid liquor. It arrives in time to such a degree of insensibility, that the wrist, feet, or even the large tendon, may be pierced with a needle, without the patient's feeling any pain. At last the nose, fingers, toes, and even privy members, fall off entire; and by a death's-dance to each of them, anticipate that of the person. It is added, that the body is so hot, that a flesh's application in the hand for an hour, will be dried and withered as it exposed to the sun for a week.

Matthew Prior says, that in Christendom there were fifteen thousand hospitals for leprosy; but for some time having been discontinued for two hundred years, the revenues of those hospitals were abused, and some of the leprosy members, to be entitled to the provision, which occasioned their regulation in some countries, and their entire suppression in others.

In France, they were united to the order of the religious of St. Lazarus and Mount Carmel in 1664, and the administration of them given to the knights of that order. See LAZARUS. In England they have been converted to other purposes.

Formerly the cause of leprosy were committed to the ecclesiastical tribunals; and it was prohibited to prosecute the leper before a lay-judge, in regard they were under the protection of the church, which separated them from the rest of the people, by a ceremony still to be seen in the ancient rituals.

As to the cure, that which proved effectual in those southern countries, is found to fail among us, where the strongest medicaments, and the most powerful mercurials are necessary. Bathing is judged to be of good use in the *lepra*. Dogs and hares are said to be subject to this disease. Among the Indians, a white man is depicted, this passing with them for the mark of a leper.

The *elephantiasis* of Madeira appears at first in the form of tubercles on any or all parts of the body; in time they ulcerate; if they happen on the head or eye-brow, the hairs fall off, but not on the head. The legs swell, and are hard, white scales cover them, and fissures appear in different parts, though in some instances the legs are emaciated, and full of ulcers. Many other very disagreeable symptoms are observed in different patients. None are observed to receive this disorder from other by contact; but the children of the diseased are generally subject to it. The bark, attended with a proper enbrocation and blistering, have effected a cure of this disorder, after mercurials and antimonials have failed.

London Med. Trans. vol. i. p. 13, &c. See LEPROSY.

Elephantine, something that relates to, or partakes of the qualities of elephants.

The term is chiefly applied to certain books of the ancient Romans, wherein were recorded the transactions of the emperors, and the proceedings, acts, &c. of the senate. This we learn from Pollio and Vopiscus, in the Life of the Emperor Tacitus, where he observes, that in the sixth press of the Ulpian library, was kept one of these *libri elephantini*; wherein, for a long course of time, were written down the decrees and edicts of the senate.

In some of these books, were registered all the acts and proceedings of the senate, and the magistrates of Rome; in others, the proceedings and events in the provinces, the armies, &c. There were about thirty-five large volumes of them, so many as there were tribes. In them were likewise contained the births, and classes of the citizens, with the musters, and all things belonging to the census. They were renewed every five years with the censuses, and were all anciently kept in the *marium*, or public treasury, in the temple of Saturn.

Vigenere, and several others, believe these books to have been called *elephantine*, by reason of their enormous bulk: but Laisius, on the seventeenth chapter of the eleventh book of Suetonius, gives us a different etymology; and shews us, they were called *elephantine*, because composed of ivory leaves or tablets, which every body knows is a production of the elephant. See DIPTYCHA.

Elephantopus, of India, and elsewhere, elephant's foot, in Batavia, a genus of the *Juncea* polygamia *perfoliata* class. Its characters are these: the flowers are collected in one common involucre, each containing four or five florets, which are tubulous, and divided into five equal parts; they have five very short hairy stamens in the bottom is situated an oval germ, which afterwards, becomes a single compressed seed, crowned with bristles, and sitting on a naked placenta.

There

There are two species, natives of the East and West Indies.

EL PHAS, *see* ELEPHANT.

ELEPHARI, in the *Matéria Medica*, a name used by some authors for the common small cardamom of the shops.

ELEVATIO, in *Periphr.*, the same as *arsis*. See *ARIS*.

ELEVATION, the altitude or height of any thing. See ALTITUDE.

The word is formed from *elevare*, to raise or lift up.

ELEVATION of a star, or other point, in the sphere, is an arch of the vertical circle, intercepted between such star, or other point, and the horizon.

Hence, as the meridian is a vertical circle, a meridian altitude or elevation, i. e. the elevation of a point in the meridian, is an arch of the meridian, intercepted between that point and the horizon.

ELEVATION of the pole, denotes the altitude of the pole above the horizon of any place, or an arch of the meridian, intercepted between the pole and the horizon.

Thus, in *Tab. Astronom.*, fig. 4. A Q being supposed the equator, H R the horizon, H Z P N the meridian, and P the pole, P R is the elevation of the pole.

In which sense elevation stands opposed to depression or depth. See DEPRESSION.

The elevation of the pole is always equal to the latitude of the place; that is, the arch of the meridian intercepted between the pole and the horizon, is always equal to the arch of the same meridian, intercepted between the equator and the zenith. Thus, the north pole is elevated $51^{\circ} 32'$ above the horizon of London; and there is the same distance, or number of degrees, between London and the equator; so that London is likewise in $51^{\circ} 32'$ of northern latitude.

To observe the elevation of the pole of any place, see POLE and LATITUDE.

ELEVATION of the equator, is an arch of the meridian, less than a quadrant, intercepted between the equator and the horizon of the place.

Thus A Q, as before representing the equator, H R the horizon, P the pole, and H Z P N the meridian; H A is the elevation of the equator. See EQUATOR.

The elevations of the equator, and of the pole, together, are always equal to a quadrant; consequently, the greater the elevation of the pole, the less the elevation of the equator, and vice versa.

Thus, in the figure just cited, P A is supposed by the construction a quadrant; and H A + A P + P R a semi-circle; consequently, H A + P R is a quadrant.

ELEVATION of the equator, to find the elevation of the pole, after the manner hereafter directed, under the article POLE.

Subtract the elevation found from a quadrant, or 90° ; what remains is the elevation of the equator. Thus, the elevation of the pole $51^{\circ} 32'$, being subtracted from 90° , leaves the elevation of the equator $38^{\circ} 28'$.

ELEVATION, in *Architecture*, denotes a draught or description of the principal face or side of a building, called also its *aspect* or *prospective*. See ORTHOGRAPHY.

ELEVATION is also used in some writers of perspective for the scenography, or perspective representation of the whole body or building. See SCENOGRAPHY.

ELEVATION, in the *Ritual religion*, is applied to that part of the mass wherein the priest holds or raises the host, with the cup above his head, for the people to adore it, after having first consecrated and adored it himself.

Whilst the priest officiates at mass, a bell is rung at the elevation, to apprise the people to call their eyes upon their new-formed Saviour and adore him.

St. Lewis decreed, that they should fall on their knees at the elevation, in imitation of certain religious whom he does not name. The Chartreux, and the religious de la Trappe, still observe this ceremony of prostrating themselves at the elevation.

ELEVATION, angle 51° , in *Astronomy*, is the angle A R B (*Tab. III. Astronom.*, fig. 47.) comprehended between the line of direction of a projectile A R, and the horizontal line A B. See PROJECTILE and ANGLE.

ELEVATION of a cannon or mortar-piece, is the angle which the chase of the piece, or the axis of the hollow cylinder, makes with the plane of the horizon.

ELEVATOR, ELEVATORIUM, in *Surgery*, an instrument used to raise up bones, as those in fractures of the skull, when beaten or crushed in with blows, or the like.

There are, denoted *elevari*, and *elevari* with three feet, called *elevari tripaludes*. See *Tab. III. Surgery*, fig. 35. The feet A, A, A, of this instrument may be brought nearer or farther from each other, as occasion requires. These feet are applied to the found parts of the head, and the screw B C is made to lay hold of the depressed part of the cranium, by turning round the handle D D, after a

small hole has been made in the middle of it with a sharp awl; then, by turning the screw E E, the screw at B is raised by degrees, and with it the depressed part of the cranium. The method of doing this is represented in fig. 36. See TREPANING and fig. 37. The *elevari* made lever-wise, is a new invention; its use is in drawing teeth. One extremity of it is flat, to rest on the gum at the bottom of the tooth; and the other hooked, like one of the branches of a pelican, to lay hold of the tooth. In *Tab. II. Surgery*, fig. 22, is represented the *elevari* for the cornea, in the operation of couching.

ELEVATOR, in *Anatomy*, is a name common to several muscles, which do the office of raising or lifting up the parts they belong to, of equal import with the ATTOL-LENS and LEVATOR. Such are the

ELEVATOR *ala nasi*, a muscle, or pair of muscles of the nose, of a pyramidal figure, very narrow, though fleshy at its origination, on the fourth bone of the upper jaw, and very broad and thin at its termination on the side of the ala nasi. Its action is to pull the ala upwards, and turn it outwards. See *Tab. Anat. (Mysl.)* fig. 1. a. c.

It is called by Winslow the *transversarius of inferior naris*, and by Albinus the *compressor naris*. Celsus has described it under the name of the *parvus nris muscularis*, and Fallopius under that of *musculus alar carnosus nris*, and Nicolaus by that of *musculus nris*.

ELEVATOR *naris*, or *aristola nasalis*, is in reality no more than a part of the muscle of the scalp, with some flesh-fibres in it, as it descends over the temporal muscles to the upper part of the concha. Its action is scarce visible; the arteries being hardly perceived in men to have ordinarily any motion at all. See *Tab. Anat. (Mysl.)* fig. 6. n. 3. fig. 1. v. 13.

ELEVATOR *humeri*, in *Anatomy*, a name given by some authors to a muscle, now generally known under the name of the DELTOIDES.

ELEVATOR *labiorum compositus*, a muscle of the lips, arising from the fourth bone of the upper jaw, and terminating at the angle of the lips, under the zygomaticus. See *Tab. Anat. (Mysl.)* fig. 1. n. 4.

ELEVATOR *labii inferioris*, is a muscle that arises from the second bone of the under jaw, below the incisores. It descends, and passes under the zygomaticus, and is inserted into the under lip.

This, assisted by a small, but strong pair of muscles, arising from the gum of the dentes incisivi, and descending directly, is inserted into the lower part of the skin of the chin, and serves to pull the skin of the chin upwards, and consequently to thrust up the lip.

ELEVATOR *labii superioris*, arises from the upper part of the second bone of the upper jaw, and descending obliquely, is inserted into the upper lip, above the dentes incisivi; it draws up the lip. See *Tab. Anat. (Mysl.)* fig. 1. n. 3. and n. 5.

ELEVATOR *oculi*, one of the muscular recti of the eye, serving to draw it upwards. See RECTUS and EYE.

ELEVE, a term purely French, though of late used also in our language. Literally it signifies a disciple or scholar, bred up under any one, being formed from the Italian, *allievo*, an apprentice or novice.

It was first used by the French writers, in speaking of painters; such a painter was an *élève* of Da Vinci, of Raphael, &c. From painting, it came to be applied to such as studied or learned any other art under a master. In the Royal Academy of Sciences, there were twenty *élèves*; and in that of inscriptions, ten *élèves*. The *élèves* are to act in concert with the pensionnaires. See ACADEMY.

The denomination *élève*, however, has been since superfluous, and that of *adjuvant* substituted in its room; because every body did not know the sense annexed to it by the academy; and now the pensionary academists have not, or formerly, each of them an *élève*; but the *élèves* are become *adjoints*, or associates of the academy.

ELEUSINIA, in *Antiquity*, the mysteries of the goddess Ceres, or the religious ceremonies performed to her honours; thus called from *Eleusis*, a maritime town of the Athenians, wherein was a temple of that goddess, famous for the celebration of these mysteries. See CEREBALIA.

Some writers call the city where the *Eleusinae* were celebrated, *Eleusina* or *Eleusis*; Harpocration confirms this orthography, in deriving its name from *Eleusina*, a son of Mercury; to which opinion Pausanias likewise adheres, in his *Attica*. Others, who write it *Eleusa*, *Eleusa*, suppose it thus called, because Ceres, after running over the world in search of her daughter, stopped here, and put an end to her pursuit. Diodorus Siculus, lib. v. will have the name *Eleusis* to have been given this city, as a monument to posterity, that corn, and the art of cultivating it, were brought from abroad into Attica.

The *Eleusinae* were the most solemn and sacred ceremonies in use among the Greeks; for which reason they were

were called *mysteria*, by way of eminence. They are said to have been instituted by Ceres herself, at Eleusis, in memory of the zeal and affection wherewith the Athenians received her.

This is the account Iliades gives in his Panegyric; but Diiodorus Siculus affirms, *na. lib. vi.* that the *Eleusinia* were instituted by the Athenians, in gratitude to Ceres, for having instructed them to lead a less barbarous and rustic life: yet the same author, in the first book of his *Bibliotheca*, relates the thing in another manner.

A great drought, says he, having occasioned a miserable famine throughout all Greece; Egypt, which had that year reaped a most plentiful harvest, bestowed part of the *fruits thereof* upon the Athenians. It was Eleutheros that brought this extraordinary supply of corn; in commemoration of which beneficence, Eleutheros was created king of Athens, who introduced the Athenians to these mysteries, and the manner of celebrating them.

This account comes near to what we are told by Herodotus and Pausanias, viz. that the Greeks acquired the knowledge of their gods and their religion from the Egyptians.

Theophrastus, *lib. i. Graecorum Afflicti.* writes that it was Orpheus, not Eleutheros, who made this establishment, and who instituted for Ceres what the Egyptians practised for Isis, which sentiment is confirmed by the scholiast on the *Alecinis* of Euripides.

Eleusis, the city where these mysteries were celebrated, was so jealous of the glory thereof, that, when reduced, to the last extremity by the Athenians, it would not surrender but on this condition, that the *Eleusinia* should not be taken away; though these were no religious ceremonies peculiar to the town, but were held common to all Greece.

The matter of these mysteries, as related by Amobius, and Lactantius, was an imitation, or representation, of what mythologists teach of Ceres. They lasted several days; during which, the people ran about with burning torches in their hands; sacrificed abundance of victims, not only to Ceres, but also to Jupiter; made libations from two vessels, one of them to the east, and the other to the west; marched in pomp to *Eleusis*, making pauses from time to time, wherein they sung hymns, and sacrificed victims; and this they performed, not only in going to *Eleusis*, but in returning back to Athens. For the rest, they were obliged to keep it an inviolable secret; and the law condemned to death any one who should dare divulge their mysteries. Tertullian, in his book against the Valentines, relates, that the figure drawn in the *Eleusinia*, and which was so expressly prohibited to the public, was that of a man's privy parts. Theophrastus, Arrius, and Clemens Alexandrinus, likewise make mention of it; but they say it was the figure of a woman's privities.

The day after the feast, the senate assembled at *Eleusis*, apparently to examine whether every thing had been managed according to order.

There were two kinds of *Eleusinia*, the greater, and the less; these we have hitherto been speaking of were the greater.

The lesser were instituted in favour of Hercules; for that hero desiring to be initiated into the former, and the Athenians not being able to gratify him therein, because the law prohibited any stranger being admitted; being loth, however, to give him an absolute denial, they instituted new *Eleusinia*, in which he assisted. The greater were held in the month Boedromion, which answered to our August; and the lesser in the month Arctemision, which happened in our January. People were only brought to partake of these ceremonies by degrees; at first, they were to be purified, then admitted to the lesser *Eleusinia*; and at last initiated in the greater. Those, who were yet only at the lesser, were called *epheboi*; and those admitted to the greater, *epheboi*, or *epheboi*, i.e. *initiated*. They were usually to undergo a probation of five years, before they passed from the lesser to the greater. Sometimes, indeed, they were contented with a single year; immediately after which, they were admitted to the most secret religious parts of the ceremony. Neustrius has an express treatise on the *Eleusinia*, where most of these points are proved.

ELIUM, *ELIUM*, in *Antiquity*, a Greek word, signifying *literary*, or *scholarship*. It was used by the Greeks as a surname, or epithet of Jupiter, given him on occasion of his having gained them the victory over Mardonius, general of the Persians, and killed, at the same time, 300,000 men of his army; and, by that means, delivered them from the danger they were in of being brought under the Persian yoke.

The word is formed from *elein*, *free*.

There were also seals consecrated on this occasion, in ho-

nour of Jupiter *Eleutherius*, and called *Eleutheria*. They were held every five years, with races of trained horses, &c. The Scholiast on Pindar, Olymp. Odes. says they were celebrated at Platae, the place where the victory was obtained.

The Samians had another festival of this name, in honour of the god of Love, and slaves, when they celebrated their liberty, were wont to keep a stated festival in remembrance of the happy day on which they were made free. Pater's *Archaeol. Graec.* lib. iii. cap. section. l. p. 388.

ELIS, or ELVA, called also *Fairies*, the names of spirits, honoured among the Saxons, with a kind of sacrifice called *Alfrit*.

ELVA-ARMED, a name given by the people of Fife, in Scotland, to certain stone weapons which they find, and which have been in use before tools and weapons of iron were used there. It is not only in Scotland that these are found, but in America, and many other places also. They are styled by some *arrows*, and *thunder-stones*, and are supposed to have fallen from the clouds in flames of thunder; others, not less erroneously, suppose them to be natural flint; but their true origin is from the workmanship of man, out of common flint, and other stones. Woodward's *Cat. Foss.* ii. p. 52.

ELIHANNE, in *Babylon*, a name given by some authors to the signetum *Aegyptiacum*, or *egyptian*.

ELICA *pyramis*, in *Natural History*, is a mountain by the people of the East Indies; it is a conical mountain, found very frequently in that part of the world, and given internally, after calcination, in *medicines*, &c.

ELICE, or HELICE, in *Botany*, a name by which the ancient Greek writers have sometimes called the willow, though its more general name among them is *Salix*. Hesychius gives many instances of the willow being called *elice*.

ELICYSUM, in *Babylon*. See CUDWEE.

ELICIT, or ELICITE, in *Medicine*, is applied to an act of the will, immediately produced by, and of the will, and received within the time.

Such are willing, willing, loving, hating, &c. These acts are denominated *elicited*, because, being before in the power of the will, they are now brought forth into act. But they are so far intrinsically, that some authors consider them as the will itself; and deny they ought to be distinguished from it, any more than light is to be distinguished from the sun.

ELIDRON, a word used by the early writers in *Medicine*, in several different senses; some using it as the name of matter, others of raptures, and others of crude mercury. Some of the chemical writers have also made it express a certain mixed metal, composed of three parts; one silver, another brass, and the third gold.

ELIGENDO *Veridicus*. See VERIDICUS.

ELIGIBILITY, in the *Remains of the Greek Language*. A bull of eligibility is a bull granted by the pope, to certain persons, to qualify them to be chosen, or invested with an office, or dignity, whereof they were before incapable, by reason of want of age, birth, or the like.

The word is formed of the Latin *eligere*, to choose; whence the word *eligibility*, &c.

In several churches in Germany, a person, who is not of the chapter, cannot be elected bishop, without a bull of eligibility.

ELIGH *morbus*, a name given by some medical writers to a fistula.

ELIGNA, a name given by Nicolaus Myrepsus, and some other authors, to that form of medicine now called a *lithia*, or *lithiatis*.

ELIQUATION, in *Metallurgy*, is a separation of the different parts of mixed bodies, by the different degrees of fire required to melt them. When the nature of ores, or of metallic mixtures is such, that while one part of them melts in the fire, the other, more refractory, and difficult of fusion, remains still solid; the first, when the mass is placed in a mild fire, flows out of the intricacies of the other, and is thus separated from it. The perfection of this operation requires a different fluidity of the parts that constitute the mass. Lead, for instance, melts into one mass with copper, by a strong fire, whereas these metals cannot dissolve each other in a moderate one; but if the mass, composed of both these, thus blended together, is afterwards exposed to a mild fire on an inclined plane, the lead alone melts, the copper becoming only brittle and spongy, and remaining in its solid form, even when the lead has run out of it. This separation, however, is not so perfectly made, but that there ever remains some lead in the copper, and some small part of the copper is also carried away with the lead; wherefore, it is necessary for this experiment, that the metals are not mixed in too minute proportions; for

ELK, in *Zootomy*, a species of the genus *vacca*. The *vacca*, or *elk*, is an animal so differently described by the authors, that it is evident they either knew very little of it, or of different varieties have described different animals under this name. Four only we, that the *elk* resembles the horse; but that it is distinguished by the length of the neck, and largeness of its ears. Solinus says that it resembles the camel; and both authors add, that its body is so large, that it cannot feed without rooting back with its head. Pliny, from report, affirms the same of the reindeer, an animal of Scandinavia. Some have compared the *elk* to the goat, and others to the stag. Some say it has a dirty yellowish colour; but Cæsar, in his *Commentaries*, represents it as variegated with spots. Pausanias tells us, that it resembles the stag; but we see the camel in the length of its neck. In the *lowermost* of the *elk*, it is a species of the *vacca* or *maia*, with horns having short beards bending into long and broad points, one pair of which is plain, and the others furnished with several sharp angles. It has no horns under the throat, it has a small excrescence.

The *elk* is a wild beast, found in the forests of Maffroy, Swedavia, and Prussia; but more abundantly in Canada, and most parts of North America.

It is about the size and figure of a male, only its front is higher, its tail shorter, its feet cloven, and that it bears a large ramus, or horn, like that of a deer. That animal, in the Royal Academy of Sciences, was five feet long in its body, its tail is brown, about the length of that of a goat, and being very simple, is used for pointing out its nine inches long, and four broad; and its tail not above two inches in its neck short and thick; the first being long and hard, though thin, so that, according to Cæsar, it will turn a mullet ball; its feet very hollow, especially that of the female; the forefeet, especially of the male, are unclawed, and are often brought in by the feet, and the fragments of its horns exceeding strong, which has occasioned some authors to say, that its legs had no joints at all; and that it was this which it is ready at finding on the ice, to save itself from the wolves. It neither runs, nor bounds, but it is in a slow kind of the swiftest running of a deer. See *Tob. H. Quadrupedi*, No. 16.

The hunting of the *elk*, is one of the principal and most agreeable employments of the savages of Canada, Acadia, &c. They choose a time when the snow is on the ground, in which the beast is apt to sink and stick. When they have killed enough with their firearms to feed for several days, they say them, and find the skins to the man of Querey, who drags them out, like the buffalo skin.

The *vacca* likewise take care to cut off the left hind-foot of each beast, especially if it be a female; the hoof of which foot is then applied as a remedy for the falling-sickness.

Authors authors tell us, that to catch the *elk*, the northern people search the occasion when it falls down at the equinox, which it frequently does; and that they lay a half of a beam at once recover enough to put in half four in the way, which cures it immediately. And hence it is, that the nation of its virtue in the cure of this disease had its rise. The Germans call it *stend*, that is, misery, because of the misery it is reduced to, in falling to sleep into the equinox, though it has its remedy always about it, which has been reason to suspect, that the virtue stands out to be a fiction.

Accordingly, Olaus Magnus says it is the outer hoof of the right foot that the *elk* puts in its ear to cure the epilepsy, which being impossible, it should soon and if it cannot shake off by any other.

He adds, that the horns which the *elk* deals are so strong, that with one hind-foot it will even break the trees; and with its fore-feet pierce the hunters through and through, though they are inoffensive animals, unless they are wounded, or in the voting season.

Pomer gives us the marks to distinguish the genuine *elk* from others, but as their virtue is very equivocal, and to say imaginary, there is no great harm in being mistaken.

ELK, in *Ornithology*, a name by which many have called the *vacca* ferus, or wild swan. See *SWAN*.

ELK, is mentioned in our *Statutes*, as a kind of yew to make bows of. 32 Hen. VIII. cap. 9.

ELL, was a measure, under different denominations, in different countries.

The *ell* is the standard, or measure, whereby cloths, stuffs, laces, &c. are usually measured, or estimated, and where, in good measure, to the yard of England, the yards of Italy, the vara of Spain, the palm of Sicily, &c.

Navius will have the *ell* to be the space contained be-

tween the two hands when stretched forth; but Aristotle makes it only the cubit.

The *ell*, which occurs most frequently in England, are English and Flemish; the *ell* English contains three feet nine inches, or one yard one quarter English measure; the *ell* Flemish contains twenty-seven inches, or three quarters of a yard; so that the *ell* English is to the *ell* Flemish as five to three.

M. Ricart, in his *Traité de Commerce*, reduces the *ell* thus: an hundred *ells* of Amsterdam are equal to ninety-eight three quarters of Linbark, Antwerp, and Brabant; to fifty-eight and an half of England, France; to an hundred and twenty of Edinburgh, Frankfurt, Leipzig, and Cologne; to hundred and twenty-five of Breslaw; to an hundred and ten of Bergen and Dronhems; and an hundred and seventeen of Stockholm.

ELLIPOMACROSTYLIA, in *Natural History*, the name of a genus of crystals. The word is derived from the Greek, *ellipso*, imperfect, uneven, long, and *stylon*, a column, and expresses an imperfect crystal, with a long column. The perfect figure of crystal being a column terminated by a pyramid at each end, those which want this character are esteemed imperfect; and accordingly the bodies of this genus are defined to be imperfect crystals, with single pyramids, one end of their column being united to some solid body, and composed of thin and slender hexangular columns, terminated by hexangular pyramids. Of this genus there are several species. See *Tob. H. Fossili*, *Class. 2*.

ELLIPOMACHYSTYLIA, in *Natural History*, the name of a genus of crystal. The word is derived from the Greek, *ellipso*, imperfect, uneven, thick, and *stylon*, a column, and expresses a crystal of the imperfect kind, with a thick column. The bodies of this genus are crystals, composed of an hexangular column, considerably thick and short, and united irregularly at one end to some solid body, and terminated at the other by an hexangular pyramid. Of this genus there are only two known species. See *Tob. H. Fossili*, *Class. 3*.

ELLIPSI, in *Geometry*, one of the conic sections, popularly called an oval.

The word is formed from the Greek, *ellipso*, deficiency, a denomination which the ancient Greek geometers gave this figure, because, among other properties, this is one, that the squares of the ordinates are less than, or defective of, the rectangles under the parameters and abscissas.

The *ellipse*, defined from its form, is a regular continued curve line, including a space that is longer than broad, wherein are two points equally distant from the two extremes of the length, from which, two right lines being drawn to any point, situated at pleasure in the *ellipse*, their sum is equal to the length of the *ellipse*.

Thus, in the *ellipse* AEBDM, *Sec. (Xc)*, *Conic. fig. 21*, the lines F a and f a drawn from the two points F and f, equally distant from the two extremities A and B, are equal to A B.

Or, taking the *ellipse*, as geometers frequently do, for the space contained or included within this curve line, it is defined a figure, contained under one single oblong line, and having two unequal axes or diameters, A B and D E. The greater axis of the *ellipse*, or the right line representing the length of the *ellipse* A B, or of the space included by the *ellipse*, is called the *transverse axis* or *diameter*; and the lesser axis, representing the breadth of the *ellipse* D E, the *conjugate* or *second axis*. The two axes always bisect each other at right angles. See *AXIS*.

The two axes are the two greatest diameters of the *ellipse*; but there are an infinity of other different diameters. See *DIAMETER*, *Sec.*

ELLIPSE, *centre of*, is the point C, wherein the two axes intersect. See *CENTER*.

The two points F and f, in the greater axis, equally distant from the extremities thereof A and B, are called the *foci*, or *whorls* of the *ellipse*; from which two lines, drawn to the circumference of the *ellipse*, as already observed, are equal to the greater axis. See *FOCUS*.

The *ellipse*, considering it as a conic section, that is, as a curve, arising from the section of a cone, is best defined from its genesis, or the manner of its production, thus: an *ellipse* is a curve line, produced by cutting the right cone A B C (*fig. 21. N° 2*) by a plane, passing through both its foci, in such manner, that the axis of the section D E meets with the diameter of the base A B produced to F; so that the cutting plane be not parallel to the base, in which case the section will produce a circle; or again, by cutting an oblique cone in any oblique direction, so that the cutting plane be not subcontrary to the base.

Or, finding it from one of its known properties, as made an ellipse, a centre line, wherein the square of the semi-ordinate PM is to the rectangle of the segments of the axis AP and PL, as the parameter is to the axis. Thus, if $AB = a$, the parameter $= b$, $PM = y$, $AP = x$, then will $b : x :: y^2 : a - x$; consequently, a $y^2 = a - bx$; See CONIC SECTIONS.

Hence, $1. y^2 = bx - \frac{bx^2}{a}$, or $ax - x^2 = \frac{bx^2}{a}$; that is, the square of the semi-ordinate is equal to the rectangle of the parameter into the abscissa, minus another rectangle of the same abscissa into a fourth proportional to the axis, parameter, and abscissa.

2. Ellipse, is that the axis, parameter, and semi-ordinate of an ellipse, being given, the axis is found, by making 1. by prop. 1. $\frac{b}{a} = \frac{y^2}{a - x}$; then $2. a - x = \frac{ay^2}{b}$; $\frac{bx - y^2}{b} = \frac{ay^2}{b}$; $bx - y^2 = ay^2$.

3. The axis AB, the abscissa AP (fig. 22), and the semi-ordinate PM, being given, the parameter AG is found, by drawing a line GL to the parameter AG, which is perpendicular to the axis AB; then, erecting a perpendicular PN, make PL = PH. Lastly, on AL, describe a semicircle.

To find the foci, conjugate axis, ratio of the ordinates, &c. in an ellipse. From B to L (fig. 22) extend half the parameter, then will CL = $\frac{1}{2}a - b$. In the centre C erect a perpendicular CK, meeting the semicircle described on AL; this will CK = $\sqrt{(a^2 - b^2)}$; therefore making CF = CK, F will be the focus. The latter equation furnishes us with this theorem.

If the axis AB be cut in the focus F, the rectangle under the segments of the axis AF, FB will be subduplicate of the rectangle under the parameter and the axis.

5. The parameter and axis AB given, the conjugate axis is easily found, by being a mean proportional between the axis and parameter; consequently, the parameter is a third proportional to the greater and lesser axis. Add, that the square of half the conjugate axis is equal to the rectangle under the distance of the focus from the vertex, and its complement to the axis, or $AF \times FB$ (fig. 23).

6. In an ellipse, the squares of the semi-ordinates PM, p, m, &c. are to each other, as the rectangles under the segments of the axis: hence, $CD^2 : PM^2 :: CB^2 : AP \times PB$; consequently, $DC^2 : CB^2 :: PM^2 : AP \times PB$; that is, the square of the less axis is to the square of the greater, as the square of the semi-ordinate to the rectangle under the segments of the axis.

7. The right line FO (fig. 24) drawn from the focus F, to the extremity of the conjugate semi-axis, is equal to half the transverse axis AC.

Hence, the conjugate axis being given, the foci are easily determined, by bisecting the greater axis AB in C, from C erect a perpendicular CD equal to the conjugate semi-axis, then from D, with the interval CD, the foci F and F' are determined.

8. To describe an ellipse. The sum of two right lines PM, and p, M, drawn from each focus of an ellipse, P and p, to the same point of the periphery M, being equal to the greater axis AB, the conjugate axis of an ellipse being given, the ellipse is easily described, by determining the foci P and p, as already directed, and being two small threads, and about these ends tying a thread FM, p, equal to the length of the greater axis AB, and the distance of the foci, the thread being flat, and a style or pin applied to it, tracing the due sweep of the ellipse or thread about the foci will describe an ellipse. See CONIC SECTIONS.

9. The rectangle under the segments of the conjugate axis, is to the square of the semi-ordinate, as the square of the conjugate axis to the square of the greater axis. Hence, the coordinates to the conjugate axis have the same relation as those to the co-ordinates to the greater axis; consequently, the parameter of the conjugate axis is a third proportional to the conjugate axis and the greater axis.

10. To determine the subtangent PT (fig. 25) and Subnormal PN in an ellipse. As the first axis is to the parameter, so is the distance of the semi-ordinate from the centre to the subnormal.

11. The rectangle under the segments of the axis, is equal to the rectangle under the distance of the semi-ordinate from the centre into the subtransverse p.

12. As the distance of the semi-ordinate from the centre is in radii of the axis, so is the abscissa to the portion of the subtangent intercepted between the vertex of the ellipse and the cusp.

13. The rectangle under the subtangent PT, into the abscissa PC, is equal to the rectangle under the segments of the axis. Hence, the square of the semi-axis AC is equal to the rectangle of CT, into PC.

14. The rectangle under the subnormal, and the distance of the ordinate from the centre, is equal to the difference of the square of this distance, and the square of the transverse semi-axis.

15. In an ellipse, the square of the semi-ordinate to any diameter is to the square of the conjugate semi-diameter, as the rectangle under the segments of the diameter is to the square of the diameter; consequently, the relation of the semi-ordinates to the diameters is the same as to the axes; and the parameter of any diameter is a third proportional to that diameter and its conjugate. For other properties of the ellipse, see CONIC SECTIONS.

Elliptic ellipse are those named by the equation $ay^2 + bx^2 = c$, which name call *hyperbola*, if m be greater than 1, or a greater than 1.

In respect of these curves, the ellipse of the former kind is called the *applanic ellipse*.

It has been long known, that if a parallelogram, circumscribed about a given ellipse, have its sides parallel to the conjugate diameters, then will its area be of an invariable or given magnitude, and equal to the rectangle contained by the axes of the figure; but this is only a case of a more general proposition; for if, upon any diameter produced without the ellipse, you take two points, on each side of the centre, at equal distances from it, and four tangents be drawn from these points to the ellipse, these tangents will form a parallelogram, which is always of a given or invariable magnitude, when the ellipse is given; if the ratio of those distances to the diameter be given; and when the ratio of those distances to the semi-diameter is that of the diagonal of a square to the side (or of $\sqrt{2}$ to 1), the parallelogram will have its sides parallel to the conjugate diameters. Phil. Trans. N° 498, p. 326.

Triangles, trapezoids, or polygons, of any kind, may be determined, which, circumscribed about a given ellipse, are always of a given magnitude. For

If, upon any diameter produced without the ellipse, any number of points be taken on the line, or on different sides of the centre, at distances from it, that are each in some given ratio to that diameter, and from these points tangents be drawn to the ellipse, in any one certain order, the polygon, formed by these tangents, is always of a given magnitude in a given ellipse, and is equal to a polygon described by a similar construction about a circle, the diameter of which is a mean proportional betwixt the transverse and conjugate axes of the ellipse.

The polygons inscribed in the ellipse, by joining the points of contact (thus formed) and the foci, bounded by the semi-diameter, drawn to these points, are also of given or determined magnitudes; and the parts of any tangent, intercepted betwixt these intersections of the other tangents, with it, or betwixt these intersections and the point of contact, are always in the same ratio to each other in the same figure. See MacLaurin's Fluxions, vol. i. p. 8; who observes that there is an analogous property of the other conic sections.

ELLIPSE, *transverse of the*. See QUANTITIES.

ELLIPSE, *reticulate of the*. See RECTIFICATION.

ELLIPSE, in Grammar and Rhetoric, is a verbal figure, or a figure of syntax, wherein something is suppressed, or left out, in a discourse, and supposed or understood; or, it is a defect or omission of some part of a sentence, which must be supplied in order to render the construction complete. See on this subject the Port Royal Latin Grammar, vol. ii. p. 168, &c. See ZYGOMA. This chiefly happens, when, being under the transport of a violent passion, a man is not at leisure to speak every thing out at length, the tongue being too slow to keep pace with the rapid motions of the mind; so that on these occasions we only bring forth broken interrupted words and expressions, which represent the violence of a passion better than any consistent discourse.

1. Boissier considers the ellipse as a way of signifying sententiæ, by suppressing the word which should make the particular application, and leaving the whole in a kind of ingenious ambiguity.

Thus

That, the Trojans, in Virgil, being reduced by Turnus to the last extremity, and ready to be destroyed, by Aeneas coming to assist them; upon which the poet says, *Speo mænia foretæ*. Which expression signifies rather, in particular, that the hope they conceive retrieves, and augments their courage; or, in general, that the hope of assistance at hand, naturally raises courage, and gives people new strength.

If the poet had said a word, and said, *Optis foretæ*, the passage had been especially restrained to the first sense, and had ceased to be a sentence, and commenced only the application of a sentence: the supposition of that word makes it a sentence in force.

This, that excellent critic looks on as one of the finesses of the Latin tongue, wherein it had vastly the advantage of the modern tongue. I have de Poëme Epique, p. 466, &c.

ELLIPTIC, or **ELLIPTICAL**, something that belongs to an ellipse.

Kepler first maintained, that the orbits of the planets are not circular, but elliptical; which hypothesis was afterwards adhered to by M. Bouilland. Mr. Flamsteed, Sir Isaac Newton, M. Caillet, and others, of the later astronomers, have confirmed the same: so that this, which was once, by way of contempt, called the *elliptic hypothesis*, is now the prevailing doctrine. But Isaac Newton demonstrates, that if any body revolve round another in an elliptic orbit, its centrifugal force, or gravities, will be in a duplicate ratio; or, as the squares of its distances from the umbilics, or focus.

Serlio, Harnow, &c. endeavour to demonstrate, that the bell forms four arches, or vaults, in the ellipse. See ARCHITECTURE.

ELLIPTIC SPHERE, is the same contained within the circumscribed sphere, or circle of the ellipse. See ELLIPSE.

It is demonstrated, 1. That the ellipse *ipse* is to a circle described on the transverse axis, as the conjugate diameter is to the transverse axis.

2. That the ellipse *ipse* is a mean proportional between two circles described on the transverse and conjugate axes.

ELLIPTIC SPHERE, or **ELLIPSOID**. See SPHERE.

ELLIPTIC SPHERE, or **ELLIPSOID**. See SPHERE.

ELLIPTIC SPHERE, or **ELLIPSOID**. See SPHERE.

ELLIPTIC SPHERE, or **ELLIPSOID**. See SPHERE.

ELLIPTIC SPHERE, or **ELLIPSOID**. See SPHERE.

By it we found the meridian, hour of the day, rising and setting of the sun, &c. See DIAL.

ELLIPTOIDES, an infinite ellipse, i. e. an ellipse defined by the equation $y^2 + z^2 = a^2 - x^2$, wherein $m > 1$, or $n > 1$. See ELLIPSE.

Of this there are several kinds or degrees: as the cubical ellipse, wherein $a^2 = x^2 + y^2 + z^2$. A quadratical or semi-elliptical ellipse, or that of the third order, wherein $a^2 = b^2 + x^2 + y^2$.

If any other ordinates be called o , and the correspondent abscissæ x , there will be

$a^2 = b^2 + x^2 + o^2$

Consequently,

$a^2 = b^2 + x^2 + o^2$

That is, $y^2 + z^2 + o^2 = a^2 - x^2$

ELLISIA, in Botany, a genus of the *pentandria monogamia* class. Its characters are these: the flower has a small cylindrical empanment of one leaf, indented in five parts at the brim. It has one tubulous petal, whose horn is cut into five segments, which spread open: it has four stamens, two of which are longer than the others, and a roundish germen, which becomes a roundish berry, crowned by the empanment, enclosing eight nuts, which have two cells, with one angular seed in each. We have but two species of this genus, which grows naturally in the West Indies.

ELIOTIA, in History, among the Greeks, a festival in memory of Europa, Agamemnon's daughter, who was called ELIOTIA by the people of Crete.

ELLYCHNOTOS, in the medical writings of the Arabs, the name of a sort of root used by the surgeons, and made of cotton or flax, rolled up into the form of the wick of a lamp or candle. See the next article.

ELLYCHNIUM, a name given by the ancients to that sort of miner, whatever it was, which served them in common use for the wicks of their lamps, and had, beside this, its use in surgery. Galen expressly directs the use of the *ellychonium*, such as that of Tarius, instead of flax, in chirurgical cases. But we are far from being ascertained, at present, of what this *ellychonium* of Tarius was. The commentators have guessed

differently as to the meaning of the word; and Cornarius supposes it to signify a sort of sponge and linseed oil, which, when properly mixed together, might be more to leave for the wicks of lamps, being very inflammable, as we well know many of the sponges to be, particularly that sort which the people of some countries call *sponck*, and use instead of tinders, to catch fire from the flasks of flint and steel; and when in its natural lax state, might, by its open spongy texture, be very well fitted to imbibe any medicinal fluid, and retain it a long time, while applied to any diseased part. Others have guessed it to be the xylon, or cotton of the ancients; but from Galen's proposing it to be used instead of sponge it seems much more probable to have been what Cornarius supposes. Galen, lib. xiii. and xiv. Cornar. Comment. in 3. Hæm. voc.

ELM, *Ulmus*, in Botany, a genus of the *pentandria digynia* class. Its characters are these: the flower has a rough permanent empanment of one leaf, cut into five points, and colored within; it has no petals, but five awl-shaped stamens, twice the length of the empanment, terminated by short erect funnels, having four furrows, and an orbicular erect germen, supporting two styles which are reflexed, and crowned with capitate feed. The germen afterward turns into a roundish nut, bordered capsule, including a single seed, and a small feed. Linnæus enumerates 20 species of this genus.

All the species of the *elm* are trees, and grow in layers, or by lockers taken from the ground, and therefore are often taken up in great quantities, and are therefore very subject to mildew, and the bark is much the best, and is very easy to be cut into small pieces of ground wood, which is much more convenient for a number of uses, than the whole tree, which would annually yield a great deal of wood, even for a nursery of this kind, is a moderately light and dry hazel hump, and the best season for laying the branches is autumn. When they have taken root, they should be removed from the old plant, and set in rows in nursery beds, where, after four or five years, they will be strong enough to be transplanted into the places where they are to remain. In planting them, great care is to be taken not to bury their roots too deep, which, when the soil is moist and stiff, often destroys them. The common *elm* seldom produces seed in great perfection, but the which *elm* produces great quantities of good ones, from which some people raise nurseries of the tree. Miller. See FREQUENT.

Elm trees are proper for hedges near the borders of fields, or for defending houses or gardens from the violence of winds. *Elm* wood is used in various kinds of water-works; and the firmness of the grain makes it fit for carving. The bark has been sometimes commended both for its purgative and astringent virtue; but neither appear to have any foundation.

ELMOROSIA, a name given by the Meurs to a dish they are very fond of. It is made of pieces of beef, or camel's flesh, flavoured with butter, honey and water; some add red wine to it, and others germs; but there are always added onions, fustion, and salt. Phil. Trans. N.º 253.

ELOANX, a name given by some writers to *carapiguanum*, or *apocynum*.

ELOCUTION, is defined by Tully, the choosing and adapting of words, and sentences, to the things, or occasions, to be expressed. For the *elocution* then properly belongs to the *elocution*, or *elocution*. That which means of the federal properties and ornaments of language in common, is called *general elocution*, consisting of ELEGANCE, COMPOSITION, and PROMPTNESS; and particularly *elocution* considers them as they are made use of to form different forms of style.

ELOCUTION is sometimes used more strictly to denote the just and graceful management of the voice, countenance, and gesture, in speaking; and in this sense it is the same with that which, in common language, is called a good delivery. As to that part which respects the management of a voice, it includes articulation, pronunciation, accent, emphasis, pause, tone, and pitch or key; and the other requisite of good delivery is *GRATITUDE*. See ARTICULATION, &c. Sheridan's Lectures, &c. Lect. 2, &c. &c.

The beauties of *elocution* consist chiefly in the use of figures, and figurative dictions or expressions, in the periods, and the style. See FIGURE, PERIOD, and STYLE. Ward's Or. p. 307.

ELODES, in Botany, an epithet given to a very soft and woolly sort of St. John's wort, or *erigeron*.

ELOODE is also used, among the ancient writers in Medicine, for a species of fever, attended with profuse sweats.

ELOGIUM, *ELOGIUM*, a praise, or panegyric, bestowed on any person, or thing, in consideration of its merit.

The word is Latin, but formed of the Greek *elogion*, commendation.

commendation; which is compounded of *eo*, well; and *doxa*, to say, or speak.

The secretary of the Royal Academy of Sciences at Paris composes the *eulogia* of such members as die; and delivers them at the next public meeting of the company. Funeral orations are *eulogia* of eminent persons deceased.

Extravagant and improbable *eulogia* are of the greatest disservice to their own design; and do, in effect, diminish the person whom they pretend to magnify. Any worthy man may pass through the world unquestioned and safe, with a moderate recommendation; but when he is set off and bedawbed with rhetoric, and embroidered so thick, that you cannot discern the ground, it awakens naturally (and not altogether unjustly) interest, curiosity and envy; for all men pretend a share in reputation, and love not to be engrossed, or monopolized; and are therefore apt to enquire (as of great estates suddenly got) whether the person so commended, came honestly by it, and of what credit the person is that tells the story.

ELOHA, in *Scripture*, the singular of **ELOHIM**, one of the names of God.

ELOHI, ELOI, or ELOHIM, in *Scripture*, one of the names of God. But it is to be observed, that angels, princes, great men, judges, and even false gods, are sometimes called by this name. The sequel of the discourse, is what tells us in judging rightly concerning the true meaning of this word. It is the same as *Eloha*; one is the singular, the other the plural. Nevertheless *Elohim* is often assumed for a singular number, particularly when the persons are many; but when false gods are spoken of, it is always plural, either in the plural. Calmer, *Dictionnaire*.

ELOHIM, in *Scripture*, signifies to remove, or send a great person, or to be said, if such as be within age be called, so that they cannot come to see personally, their next friends shall be admitted to see for them. Stat. 13 Edw. 4. cap. 15.

ELOME, a name given by some authors to **ORPHEUS**. **ELONGATA**, in *Law*, has relation of the sheriff, that cattle are not to be found, or removed, so that he cannot make deliverance in replevin.

ELONGATION, in *Astronomy*, the digression, or recess of a planet from the sun, with respect to an eye placed on our earth; or it is the angle formed by two lines drawn from the earth to the sun, and from the earth to the planet, or the arc measuring this angle.

The greatest distance of the planet, &c. from the sun, is called the *greatest elongation*, which varies on two accounts, viz. in that both the earth, and the planet, revolve, not in circles, but in ellipses; and the variation is greatest in the orbit of Mercury, which is the most elliptic. In a circular orbit, having the sun for its centre, the greatest *elongation* would happen, when the right line, joining the earth and planet, touched the orbit of the planet; and this might easily be found, because the tangent to the orbit, and the distances of the earth and of the planet from the sun, form a right-angled triangle, in which, having two sides, viz. the distances, the vertical angle, or angle of *elongation*, may be easily found. But in an elliptic orbit it may happen, that the *elongation* from the sun may grow still greater, even after it has left the place where the line joining the earth and planet touches its orbit. For after that, the true distance of the planet from the sun may increase, whilst the distance of the sun and planet from the earth do not increase, but they may rather decrease; and therefore in two triangles the greater base will subtend the greater angle. If the greatest *elongation* be found by observation, the distance of the planet from the sun, supposed to move in a circular orbit, may be obtained, in respect of the earth's distance from the same. Keil's *Algebra*, p. 157.

The *elongation* is chiefly considered in Venus and Mercury. The *greatest elongation* of Venus is 48 degrees, and that of Mercury 28 degrees; that is, the former never recedes from the sun, or is seen distant from him, above 48°; nor the latter above 28°. Whence it is, that Mercury is so rarely visible; as being usually lost in the light of the sun. See **MERCURY**, and **VENUS**.

The *elongation* of the superior planets from the sun may amount to 180°; or they may be in opposition to the sun, as viewed from the earth.

ELONGATION is also used, by some authors, for the difference in motion, between the swiftest and the slowest of two planets; or the quantity of space, whereby the one has overgone the other; called also *superiority*.

The swiftest motion of the moon, with regard to the sun, is called the *elongation* of the moon from the sun. We also say, diurnal *elongation*, horary *elongation*, &c.

ELONGATION, angle of, or angle at the earth, is the difference between the sun's true place, and the geocentric place of a planet. Such is the angle **ETR** *Tob. Adm.*

Vol. II. N° 112.

fig. 25.) between the place of the sun E, and that of the planet R.

ELONGATION, in *Surgery*, is an imperfect luxation; when the ligament of any joint is so extended, or relaxed, as to lengthen the limb, but yet not to let the bone go quite out of its place. See **LUXATION**.

ELOPEMENT, in *Law*, is when a married woman, of her own accord, departs from her husband, and dwells with an adulterer; for which, without voluntary reconciliation to the husband, the shall lose her dowry; nor shall the husband, in such case, be compelled to allow her any alimony.

Sponsa virum suum fugiens, et adultera facta
Dote sua caret, nisi sponte sponte relicta.

The word is formed from the Belgic, *El*, matrimony, and *lopes*, to run away.

However, mere advertising a wife in the Gazette, or other public papers, is not a legal notice to persons in general not to trust her; though a personal notice given by the husband to particular persons is said to be good. An action lies, and large damages are usually given, against for carrying away, and detaining another man's wife.

ELOPIUM, a name given by some of the old chemists to vitriol.

ELOYS, *Elois*, in *Zoology*, the name of a serpent, otherwise called *ELAPSE*.

ELOYS was also the name of a fish much esteemed among the Greeks, and thought to be the same with the *ACIPERSEN*, *Holm. Lex.* in voc.

ELOQUENCE, the art of speaking, or writing well; so as to move and persuade. See **HEROTIC**, and **ORATORY**.

If *eloquence* and *rhetoric* be distinguished, the latter may be considered as propelling and explaining the theory, and the former as the practice of the art: but they are generally used indifferently for each other.

Democritus and Cicero are the two patterns of ancient *eloquence*: the one among the Greeks, the other among the Romans. Their manner, however, was exceedingly different; the first being clear, strong, nervous, concise, and fervent, so that a word could not be spared; the latter, copious, florid, and rich, so that a word could not be added.

It was objected to Cicero, that his *eloquence* was Asiatic, that is, redundant, or stuffed with superfluous words and thoughts.

Pericles was called a *torrent of eloquence*, a *thunderbolt of eloquence*. Pedans do not distinguish *eloquence* from the heaping up of figures, the use of big words, and the rotundity of periods.

True *eloquence* depends principally on the vivacity of the imagination. In strictness, it is not that which gives grace and ornament, but life and motion, to discourse. The authors of the Art of Thinking remark, that the rules of *eloquence* are observed in the conversation of people naturally *eloquent*, though they never think of them, while they practise them. They practise those rules, because they are *eloquent*; not in order to be *eloquent*.

The *eloquence* of the chair, and pulpit, is much more difficult than that of the bar. Sir George Mackenzie has a treatise of the *eloquence* of the bar. *Idea Eloquentiae forensis*, &c.

ELOSITES, in *Natural History*, the name of a stone, mentioned with great respect by the writers of the middle ages; they have left us, however, no clear description of it, than it is impossible to determine what it was; they only say, that it was no very beautiful stone, but that, if worn in the pocket, it had a wonderful virtue in curing pains, and all other diseases in the head.

ELIPS, a name given, by some of the chemical writers, to the fœces of *silver*.

ELUSTICI, *Elustici*, among the Greeks, a sect of philosophers who made hope the ruling passion of mankind.

ELTHYMUM, in the *Materia Medica* of the *Arabs*, a name given to the epithymum, or dandelion growing upon thyme.

ELUDING, the art of evading, or rendering a thing vain, and of no effect; a dextrous getting clear, or elapsing out of an affair, difficulty, embarrassment, or the like.

We say, to *elude* a proposition, &c. The design of elusiveness is, to elude the force of the laws: this doctor has not resolved the difficulty, but *eluded* it. Alexander, says the historian, in cutting the Gordian knot, either *eluded* the oracle, or fulfilled it. *Idem nequiquam solutus: cum loquutus esset, Nilil, inquit, interit, quoniam solutus: quod loquutus omnia hinc, et cuncta fortis, vel eludit, vel implet.* Q. Curt. 13.

ELVÆ. See **ELFS**.

ELVELA, in *Botany*, a name given by Linnaeus to a genus of fungues, called by Micheli *fungus elvelæ*, and *fungoides*.

invasions, &c. One great occasion of *embargos* is, that the government may make use of the merchant-vessels, with their equipage, &c. in armaments, expeditions, transporting of soldiers, &c. another is, to stop the communication of intelligence at such critical seasons. *Embargos* are of very mischievous consequence to commerce.

EMBARRAS, EMPARREMENT, a French term, though now naturalized, denoting a difficulty, or obstacle, which perplexes or confounds a person, &c.

EMBASIS, in the writings of the *Ancient Physicians*, the name of a large vessel, in which they prepared their medicated baths, and which was capable of holding the person to be bathed at his full length.

EMBASSADOR, or AMBASSADOR, a public minister, sent from one foreign prince, as a representative of his person to another.

The word is derived from the corrupt Latin *ambasciator*, formed of *ambascia*, an old word borrowed from the Gauls, signifying *servant, client, domestic, or officer*. Such is the origin given by Borel, Menage, and Chifflet, after Salmasius and Spelman.

In Latin we usually call this kind of minister *legatus*, or *orator*, though its certain the word *ambasciator*, with us, has a much more extensive signification than that of *legatus* among the Romans; and, excepting that they are both under the protection of the law of nations, there is scarce any thing in common between them.

Ambassadors are either *ordinary* or *extraordinary*.

EMBASSADOR in ordinary is he who resides lately in the court of another prince, to maintain a mutual good understanding, look to the interests of their masters, and transact such affairs as may occur.

Ambassadors in ordinary are but of modern invention; it is not above two hundred years ago since they were first heard of; till then, all *ambassadors* were *extraordinary*, and retired as soon as they had dispatched the affair they were sent upon.

EMBASSADOR extraordinary is a person who is sent to a prince's court on some particular and emergent occasion; as to conclude a peace, marriage, or to make a compliment, &c.

Indeed there is no essential difference between *ordinary* and *extraordinary ambassadors*; they equally enjoy all the privileges and prerogatives which the law of nations decrees.

At Athens the *ambassadors* from foreign princes and states always mounted the tribunal, or pulpit, of the public orators, and there opened their commission, and acquainted the people with their business. At Rome they were introduced to the senate, and delivered their commission to them. Among us, they make their address immediately and solely to the king.

Athens and Sparta, says M. Tourneil, when in all their glory, were never so much delighted, as to see and hear a number of *ambassadors*, in their assemblies, suing for their protection or alliance. It seemed to them the noblest homage that could be paid them; and that state, which received the most ambassadors, was judged to have the advantage over the other.

The name of *ambassador*, Cicero observes, is sacred and inviolable: *non modicum facerem per, sed etiam inter hostium tela incommittitur*. In Verr. Orat. vi.

The *ambassadors* of kings should never attend at any public assemblies, marriages, interments, or other solemnities, unless their masters have some interest therein; nor must they even go into mourning, or the like, on any occasions of their own, because they represent the persons of their prince; and for this reason, they owe no subjection to any laws but those of their own country, and their actions are not subject to the control of the private law of that state, in which they are appointed to reside.

It has been held, both by our common lawyers and civilians, that an *ambassador* is privileged by the law of nature and nations; and yet, if he commits any offence against the law of reason and nature, he shall lose his privilege; and therefore, if an *ambassador* commits the death of the king in whose land he is, that he may be condemned and executed for treason; but if he commits any other species of treason, he must be sent to his own kingdom. However, though these principles might formerly obtain, the general practice of this country, as well as of the rest of Europe, seems now to pursue the sentiments of the learned Grotius, De Jur. Bell. & Pac. p. 18. A. that the security of *ambassadors* is of greater importance than the punishment of a particular crime.

And, therefore, few, if any, examples have occurred within a century past, where an *ambassador* has been punished for any offence, however atrocious in its nature. With respect to civil suits, neither an *ambassador*, nor any of his train or *entourage*, can be prosecuted for any debt, or contract, in the courts of that kingdom where he is sent

to reside. By 7 Anne, cap. 12. an act passed in 1708, in consequence of the arrest of an *ambassador* from Peter the Great, earl of Mulkov, for a debt of 500. all process, whereby the person of any *ambassador*, or of his domestic, or domestic servant, may be arrested, or his goods distrained or seized, shall be utterly null and void, and the prosecutors be punished at the discretion of the lord-chancellor, and the two chief justices, or any two of them. However, no bankrupt under, retained in the service of an *ambassador*, shall be privileged by this act; nor any servant, whose name is not registered with the secretary of state, and transmitted to the sheriffs of London and Middlesex. These privileges are allowed in the courts of law. Blackstone's Commentaries, vol. 1. p. 253. Sec.

EMBASSY, or AMBASSY, Legatio, a mission from one foreign prince, or state to another, of some able experienced person, to negotiate some affair, in quality of *ambassador*.

Fr. Daniel observes, that under the ancient French kings, their *ambassadors* consisted of a body, or number of persons joined together in commission, and who composed a kind of council; something like which is still retained at treaties of peace. Thus the French *ambassadors* at Vienna, for the peace, consisted of three *ambassadors*, that of Utrecht, of two, &c.

We likewise read of *ambassadors* of the female sex; such as chalcid Gushant, Wigmore, &c. &c. &c. and perhaps the only woman, who has ever acted in this role in quality of *ambassador*. Henry IV. tells us, that the king of France sent one of his court on an *ambassy* to the emperor, to settle the troubles of the empire.

EMBATTLED, a term in Heraldry, which signifies, that an ordinary is notched after the manner of a battlement. See II. Heraldry, p. 59. representing the battlements of a wall, or castle. See **BATTLEMENT**.

None were suffered, in ancient times, to embattle their houses, but those who had great dignities, as the barons, and the like. Camden proves this in his account of Tunstall's seat in England, in which he expresses it as a signal mark of the royal favour, that he had liberty given to embattle it. The heralds express this embattled line by the term *crenel*; and when it has the embattling on both sides, which is the more rare, they call it *mer-tres*.

EMBER-geese, in Ornithology, the *COMYNUS immer* of Linnaeus, is larger than a common goose; its head is dusky; the back, coverts of the wings, and tail, are clouded with lighter and darker shades of the same; the primaries and tail are black; the under side of the neck marked with dusky spots; the breast and belly fleshy, and the legs black. The skin is so tough, that it has been used in fount of the northern countries as leather. This species inhabits the seas about the Orkneys, and in severe winters visits the southern parts of Great Britain. See **DIVER**.

This species of the wild geese is said to hatch her young under her wing. The reason of this absurd opinion is, that none ever saw her on the land, or out of the water, and that they have a cavity under one of their wings capable of containing a large egg. Phil. Trans. N° 473. 18.

ENTER-weeks are those wherein the *enter*, or *entering-days* fall.

In the laws of king Alfred, and those of Canute, those days are called *judicia*, that is, *crucial days*, from whence the word was probably corrupted into *enter-days*. By the canonists, they are called *quatuor anni tempora*, the four cardinal seasons, on which the circle of the year turns; and hence Henshaw takes the word to have been formed, viz. by corruption, from *tempus*, of *tempore*.

Mr. Somner thinks they were originally gifts, instituted to beg God's blessing on the fruits of the earth. Agreeably to which, Skinner supposes the word *enter* taken from the alien, *enters*, then stewed on the bead.

The *enter-days* are the Wednesday, Friday, and Saturday, after Quadragesima Sunday, or the fifth Sunday in Lent, after Whitunday, after Holyrood day in September, and after St. Lucy's day in December; which four times answer well enough to the four quarters of the year, spring, summer, autumn, and winter.

The *enter-weeks* are now chiefly taken notice of on account of the ordination of priests and deacons; because the canon appoints the Sundays next succeeding the *enter-weeks* for the solemn times of ordination; though the bishops, if they please, may ordain on any Sunday or holyday.

EMBERIZA, in Ornithology, a name, with the epithets of white and yellow, expressing the lustrous and yellow-hammer. In the Linnaean system this is a distinct genus of *passeri*, including a great number of species. For the general

general characters, see BUNTING. See also REEF-SPARROW, SNO-W-BIRD, YELLOW-HAMMER, &c.

EMBLEM, *Emblema*, a kind of painted enigma, which, representing some obvious history, with reflections underneath, instructs us in some moral truth, or other matter of knowledge.

The word is pure Greek, formed of the verb *embaïno*, to cast in, to insert. Suetonius relates, that Tiberius caused the word to be crated out of a decree of the Roman senate, because it was borrowed from another language.

Such is that very significant image of Scævola, holding his hand in the fire; with the words *arceat & pati fertur, Romanum est: si te deus et suffraganeus, si Romanus*.

The emblem is somewhat plainer, and more obvious, than the enigmas. Gale defines emblem an ingenious picture, representing one thing to the eye, and another to the understanding.

The Greeks also frequently gave the name emblem, to characters, to inscriptions, or minor works, and even to all kinds of ornaments, of vases, moveables, garments, &c. And the Latins used *emblemata* in the same sense. Accordingly, Cicero, reproaching Verres with the statues and fine wrought works he had plundered from the Sicilians, calls the ornaments fixed thereto (and which, on occasion, might be separated from them) *emblemata*. Add, that Latin authors frequently compare the figures and ornaments of poetry to these *emblemata*; thus, an ancient Latin poet, praising an orator, says, that all his words were ranged like the pieces in mosaics,

ut tessellæ omnes,

Atque pavimenti, atque emblematicæ variculae.

We do not use the English word emblem in this sense; though the ancient jurists could always retain the Latin *emblemata* to express such ornaments; because the Greek *emblemata* literally denotes any thing applied, or added to a body by way of ornament.

With us, emblem ordinarily signifies no more than a painting, bust, relief, or other representation, intended to hold forth some moral or political instruction.

What distinguishes an emblem from a device is, that the words of an emblem have a full, complete sense of themselves; nay, all the sense and signification which they have together with the figure.

But there is yet a further difference between emblem and device; for a device is a symbol appropriated to some particular person, or that expresses something which concerns him particularly; whereas an emblem is a symbol that regards all the world alike.

These differences will be more apparent from comparing the emblem above quoted with the device of a candle lighted; and the words *juvando iustissime, I waste myself in doing good*.

According to Lord Bacon, emblem is of use in the art of memory, as sensible objects strike the mind stronger than what is intellectual. Thus, it is easier to retain the image of a sportsman hunting a hare, of an apothecary ranging his boxes, an orator making a speech, a boy repeating verses, or a player acting his part, than the corresponding notions of invention, disposition, elocution, memory and action. Works abr. vol. i. p. 136. vol. ii. p. 475. and vol. iii. p. 106.

EMBLEMATICAL, *emblematicus*. See CHARACTER.

EMBLEMENTS, *Fr.* from *emblaver*, q. d. *fecit en blis*, to sow with wheat, a term highly signifying the profits of lands sown; though sometimes used more largely for any profits arising, and growing naturally from the ground; as grass, fruit, &c.

If a tenant for life sow the land and die, his executor shall have the *emblemata*, and not he in reversion. But if the tenant for years sow the land, and before severance the term expires, there the lessor, or he in reversion, shall have the *emblemata*, and not the lessee.

The advantages of *emblemata* are particularly extended to the parochial clergy by 28 Hen. VIII. cap. 11.

EMBOLIMÆAN and **EMBOLIMIC**, *intercalary*, is chiefly used in speaking of the additional months which chronologists insert to form the lunar cycle of 19 years.

The 19 solar years consisting of 6939 days, and 18 hours; and the 19 lunar years only making 6726 days; it was found necessary, in order to render the 19 solar years equal to the 19 lunar, which make the lunar cycle of 19 years, to intercalate or insert seven lunar months, containing 259 days; which, with the four bissextile days happening in that interval, make 263 days, and the whole 6939 days. See CYCLE.

By means of these seven *embolimici*, or additional months, the whole 6939 days and 18 hours of the solar years are employed in the calendar.

In the course of 19 years there are 228 common moons, and seven *embolimici* moons. Their distribution is thus: every 3d, 6th, 9th, 11th, 12th, 17th, and 19th years, are *embolimici*; and consequently contain 384 days a-piece.

Vol. II. N° 112.

And this was the method of computing time among the Greeks, when they used the *emmenometica*, or cycle of 19 years. But they did not keep regularly to it, as the Jews seem to have done. The Greeks were followed by the Romans till the time of Julius Cæsar.

The *embolimici* months, like other lunar months, are sometimes 30 days, and sometimes only 29. See YEAR.

The *embolimici epactæ* are those between XIX and XXIX; which are thus called, because, with the addition of the epact XI, they exceed the number XXX; or rather, because the years, which have these epactæ, are *embolimici*; having thirteen months a-piece, whereas the 13th is the *embolimicus*.

EMBOLISMUS, *Embolismus*, in Chronology, signifies intercalation.

The word is formed of *embolao*, to insert. See EMBOLISMIC.

As the Greeks made use of the lunar year, which is only 354 days, in order to bring it to the solar, which is 365 days, they had every two or three years an *embolimus*, i. e. they added a thirteenth lunar month every two or three years; which additional month they called *embolimus*, *embolimus*, because inserted, or intercalated.

EMBOLUS, the moveable part of a pump, or syringe; called also the piston, and popularly the sucker. See PISTON, PUMP, and SYRINGE.

The pipe, or barrel of a syringe, &c. being close shut, the *embolus* cannot be drawn up without a very considerable force; which force being removed, the *embolus* returns again with violence. This phenomenon the Aristotelians attribute to nature's abhorrence of a vacuum.

But the modern philosophers finding, that in an exhausted receiver the *embolus* is easily drawn up, though the orifice be stopped, prove that it is the pressure of the atmosphere on the external parts of the *embolus*, that makes the difficulty of drawing it up. See AIR, ATMOSPHERE, and SYRINGE.

EMBOSSING, or **EMBOSSING**, the act of forming, or fashioning works in relief, whether they be call, or moulded, or cut with the chisel, &c.

Embossing is a new great part of sculpture; being that which has to do with figures raised, or prominent from the plain, or ground; the other part, which makes figures, &c. that are indented, or cut in below the ground, is called engraving. See ENGRAVING.

EMBOUWELLING, *also*, in Law, is part of the punishment of High-Treason.

EMBRACE a volt, in the Manege, is used when a horse, in working upon volts, makes a good way every time with his fore-legs. The opposite term to embracing a volt, is beating the dust, which is putting his fore feet near the place from whence he lifted them.

Embracing the ground is used in the same sense with embracing the volt. A horse cannot take in too much ground, provided his crupper does not throw out; that is, does not go out of the volt. See BEAT.

EMBRACEOR, in Law, a person who, when a matter is in trial between party and party, comes to the bar with one of the parties (having received some reward for so doing), and speaks in the cause, or privately labours the jury, or stands there to overlook, awe, or put them in fear. The penalty thereof is twenty pounds, and imprisonment at the discretion of the justice.

EMBRACERY, in Law, the act or offence of embracers. See EMBRACER.

EMBRASURE, in Architecture, an enlargement of the gap or aperture of a door, or window, within-side the wall. See DOOR.

Its use is to give the greater play, for the opening of the door, window, casement, &c. or to take in the more light.

The *embrasure* counting, sloping inwards, makes the inner angles oblique. When the wall is very thick, they sometimes make *embrasures* on the outside.

EMBRASURES, in Fortification, denote the holes, or apertures, through which the cannons are pointed; whether in casemates, in batteries, or in the piers of walls. See CANNON, ORDNANCE, BATTERY, &c.

The *embrasures* are generally about fifteen feet apart, from six to nine or ten feet wide without, and from two to three within. Their height from the platform is usually three feet on the inside, and a foot and half on the outside; that to the muzzle, on occasion may be sunk, and the piece brought to shoot low.

The best *embrasures* are those made with a neck, whereby a part of the opening becomes more contracted, and consequently is better adapted to preserve the gunners and cannon from the enemy's shot, than when the cheeks of the *embrasures* are made straight. It is most desirable to have the axis of the *embrasure* at right angles to the length of the parapet, yet it may be sometimes necessary to have them oblique. In this case the inside of the parapet is notched, or cut away, so as to leave room for the front of the platform, that the wheels of the carriage

may credit Tavernier, in his treatise of coloured stones found in the Indies, inferred in the second volume of his Voyages, these two should be farther reduced to one, viz. the Peruvian.

In effect, he pretends that there is not, nor ever was, any mine of emeralds in the East Indies; and that all that are there found, were brought from Peru by the way of the South-sea; which was a method of commerce carried on by the Peruvians before the discovery of America by the Spaniards. But as the point of such commerce is not sufficiently proved, we must keep to the ancient division. The Oriental emerald is harder, more brilliant, and transparent, than the Peruvian; which has generally clouds found in it, and sparkles less. Beside, that there are such quantities brought from Peru, by the way of Cathagena, that they are much sunk in value and reputation. There are also European emeralds, but they are little other than coloured crystal.

Some authors say, that emeralds are usually taken out of iron mines; and Pomet assures us, he had one to which the iron ore was full sticking. To which, all we have to say, is, that it could not be a Peruvian, because there is no iron mine in the country.

The emerald is supposed to grow more and more perfect by flow degrees, as the fruit comes to maturity on trees. It is a common opinion, that the emerald grows in the Jasper; and it is certain there are some Jaspers so perfectly green and fine, that many have taken parts of them for emeralds.

But the proper matrix or nucleus of this stone is the *prima d'argento*, which is held among the coster precious stones; being hard, semi-pellucid, and often intermixed with yellow, green, white, and blue, &c.

The genuine emerald when in its most perfect state, is perhaps the finest and most beautiful of all the gems. It is found of various sizes, but usually small. Multitudes are met with of about the sixteenth of an inch in diameter, and they are found from this up to the size of a walnut. We have accounts of some of immense size among the ancients; but they were evidently not emeralds, but Jaspers, or other green stones. The large specimens at present are very scarce; and whether they are Oriental or Occidental, are of very great value.

The emerald is naturally of different figures, like the diamond, and many of the other gems. It is sometimes found in a roundish, or pebble-like form, but much more frequently in a columnar, or singular one, resembling common crystal. The pebble emeralds are always the hardest and brightest, but are seldom found exceeding the size of a pea, very rarely coming up to that of a horse-bean. The crystalliform usually grow several together, and are often considerably large. The pebble emeralds are found loose in the earth of mountains, and in the sands of rivers; the columnar are usually found adhering to, or bedded in a white, opaque, crystalline matter, and sometimes to the Jasper, or to the Prasine; which last has been therefore called by some the mother of the emerald. By Mr. Bergman's analysis, 100 parts of emerald contain 60 of argill, 24 of silica, 8 of calcareous earth, and 6 of iron; and by that of Mr. Arghard, 60 of argill, 21,66 of silica, 8,33 of calcareous earth, and 5 of iron.

The rough emerald, of whatever form, is usually of a very bright, and naturally polished surface, and is ever of a pure and beautiful green, without the least admixture of any other colour. It is of all the various shades of green, from the deepest to the palest, and doubtless is sometimes wholly colourless; but it is then esteemed a sapphire; all the harder gems, when colourless, being called by our jewellers *whites sapphires*.

With a moderately strong heat the emerald becomes blue, but recovers its original green colour when cold. Emeralds, by being exposed to condensed solar heat, have been rendered white, and of various colours, and soon afterwards fused, by which operation they lost part of their weight and hardness. But M. d'Arcet could not fuse an emerald in the intense and long continued heat of a porcelain furnace, although the colour and transparency of it were thereby altered. Emeralds have the property of shining in the dark, after having been heated. They are the fourth in degree of hardness from DIAMONDS, and yet are susceptible of impression from a file. The Oriental emeralds are very scarce, and are at present found only in the kingdom of Conchy; very few of them have of late been imported into Europe, inasmuch that some have supposed that there were in nature no Oriental emeralds, but within these few years some have been brought from Conchy into Italy, which greatly exceed all the American ones in beauty, as well as hardness.

The American emeralds, which as they are the finest that come to us, are called by our jewellers Oriental, are found principally about Peru, in the earth of some mountains. The European emeralds come principally

from Silesia, though there are of them in other places; and the coloured crystals, which are what we usually meet with under the name of Occidental emeralds, are obtained from the mines of Germany.

The ancients made amulets of emeralds against all kinds of sorcery; and supposed them effectual against a thousand different diseases. At present, when we have more experience, or less credulity, they are valued for their beauty, not their virtue; though there are still some who suppose, that when reduced into an impalpable powder, and mixed with rose-water, they may be of some use in medicine.

We read in authors of several emeralds of incredible magnitude. Rodrigo de Toledo tells us, that when the Saracens took that town, king Taik had for his share of the plunder a table three hundred and sixty-five feet long, and all of a piece, which he maintains to be an emerald. After this, the reader will not wonder at that pretended to have been seen by Theophrastus, in a temple in Egypt, four cubits long, and three broad; nor even at an obelisk of emerald forty feet high. But these were not perfectly emeralds in our sense of the name, but only green marble, or other such stones.

In the *Dictionnaire de Commerce*, we have a very curious and accurate estimate of the values of the different kinds of Peruvian emeralds, which the reader will not be displeased to find transcribed here.

Those of the first sort, called *plasma*, for grinding are worth 27 shillings the marc, or 8 ounces. The demi-morillon, of first per marc. Good morillon, which are only little pieces, but of fine colour, from 13s. to 15s. per marc. Emeralds, larger than morillon, and called of the third value, or first, are valued at from 50s. to 60s. the marc. Emeralds, called of the second sort, which are in larger and finer pieces than the preceding, are worth from 60s. to 75s. per marc. Lastly, those of the first colour, otherwise called *negres carres*, are worth from 110s. to 135s.

EMERALDS ready cut, or polished, and not cut, being of good stone, and of fine colour, are worth,

Those of ten carats	33	0

EMERALDS, counterfeits. The manner of making green-fair emeralds in pale is this: take crystal prepared twice ounces; common sulphur, or red-lead, four ounces; mix these well together, then add of good verdigris two penny-weights, and crocus martis made with vinegar, eight grains. Mix all these well together, and for the whole in the hottest part of a potter's furnace, as long as the fire lasts. It must be put into a strong crucible, and covered with a laze. When it is cold take off the time, and if it is baked enough, it will be clear in the bottom; otherwise relute the pot, and put it into the furnace again. Twenty-four hours commonly is sufficient for making this; sometimes it requires a little more. The pale, thus made, is harder than ordinary, and is of a fine colour, and capable of a good polish. Neri's Art of Glass, p. 128.

If the pale be desired of a very deep emerald colour, take prepared crystal, one ounce; reddish, six ounces and a half; of verdigris, three penny-weights, and thirteen grains; and of crocus martis, made with vinegar, ten grains. This requires a longer baking than the other, and is less hard, though of a deeper colour.

The proportions of these ingredients may be varied at pleasure, and the colour be made of all degrees of deepness; but the more lead is added the more baking is required, and, after all, the pale will be so much the softer.

EMERALD-GLOSS, in the Glass Trade. The way of giving this beautiful dye to glass is this: in the pots of melted metal, made of polymer, and without manganese, when the matter is well purified, put a little crocus martis calcined with vinegar. About three ounces of this crocus is enough for a hundred weight of glass; let it stand till thoroughly mixed, then put into every hundred weight of metal two pound of calcined brass; this must be added as six different times, letting the metal stand two hours every time. When this is all in, make a proof of the metal; and if it has any bluishness, add more crocus martis, a small quantity at a time. When the whole is of a fine leek green, let it stand twenty-four hours to mix thoroughly, and then work it. Neri's Art of Glass, p. 51.

EMERALD, or **EMERALDUS**, in *Herakles*, is used in the art of vert, or green, in blazoning the arms of dukes, earls, &c.

EMERGENT year, in *Chronology*, is the epocha, or date, whence we begin to account our time.

Our *emergent year* is sometimes the year of the creation; the Jews use that of the deluge, or the Exodus, &c.

The *emergent year* of the Greeks was the establishment, or at least reformation, of the Olympic games by Iphitus. The Romans accounted their years from the building of the city, AN U. C. that is, **AB URBE CONDITA**. See **EPOCHÆ**.

EMERSION, in *Physics*, the rising of any solid above the surface of a fluid specifically heavier than itself, into which it had been violently immersed, or thrust.

It is one of the known laws of hydrostatics, that a lighter solid, being forced down into a heavier fluid, immediately endeavours to emerge; and that with a force, or moment, equal to the excess of a weight of a quantity of the fluid above that of an equal bulk of the solid.

Thus, if a solid be immersed in a fluid of double its specific gravity, it will emerge again, till half its bulk, or body, be above the surface of the fluid.

EMERSION, in *Astronomy*, is when the sun, moon, or other planet, begins to re-appear, after its having been eclipsed, or hid by the interposition of the moon, earth, or other body. The difference of longitude is sometimes found by observing the immersions and *emersions* of the first of Jupiter's satellites.

The immersions are observed from the time of Jupiter's being in conjunction with the sun, to his opposition; and the *emersion*, from the opposition to the conjunction; which two intervals are usually six months a-piece, and divide the year between them.

But when Jupiter is in conjunction with the sun, and fifteen days before and afterwards, there is nothing to be observed; the planet, with its satellites, being then lost in the light of the sun.

EMERSION is also used when a star, before hid by the sun, as being too near him, begins to re-appear, and to get out of his rays.

EMERSION, *astron.* or *minutes of*, an arch of the moon's orbit, as *T. Q. V. Lib. Astron. fig. 46*, which the moon's centre passes over, from the time she begins to emerge out of the shadow of the earth to the end of the eclipse.

EMERUS, in *History. See *Serpian SENA*.*

EMERY, a sort of metallic stone, found in several mines of metals; but chiefly in those of iron, being properly an iron ore. *Emery*, says Mr. Kewen (Elem. Min. p. 272) seems to be a mixture of the red and white calces of iron, with some unknown stony substance, perhaps tripoli: it scarcely yields in hardness to any substance except diamond; the best sort is of a dark, grey colour, but becomes brown and in great measure magnetic by calcination: other sorts are of a reddish rusty white, or yellowish colour; its specific gravity is from 3,000 to 4,000: it is never used as an iron ore, nor is its proportion of iron well known.

The word comes from the French *emeri*; formed from the Latin *meris*, and that from the Greek *meris*, which signifies the same thing; and which *Emery* derives from the verb *emerere*, *I draw, take*.

We usually distinguish three kinds of *emery*; the Spanish, red, and common *emery*. The first is found in the gold-mines of Peru, and other provinces of the Spanish America: it is judged a kind of ore of that rich metal; being streaked with little veins, and specks of gold. It is for this reason the king of Spain prohibits its being exported, which renders it exceeding rare among us; to the great regret of the seekers of the philosopher's stone, who have formed great hopes from the transmutation of this precious metal. The Spanish *emery* seems to be no other than the metal now called *PLATINA*; and the European *emery* may probably participate of the same metal. The red *emery* is found in copper-mines; the little we have of it comes from Sweden and Denmark.

The common *emery* is taken out of iron mines; and is almost the only sort used among us. The consumption thereof is very considerable among the armourers, cutlers, locksmiths, glassiers, lapidaries, masons, &c. some of whom use it to polish and burnish iron, and steel works; others, to cut and polish glass, marble, and precious stones. This *emery* is of a brownish colour, sometimes bordering a little on red; exceedingly hard, and of consequence difficult to pulverize. The English are the only people that have acquired the art of making it into powder; which they do chiefly by means of certain mills contrived for that purpose; and thus send it in powder to their neighbours.

Pounding it in mortars were in vain; it being so hard, that it would pierce or break the mortar before it would break itself.

Of the powder, the most subtle and impalpable is the best; as to the stone, it should be chosen of a high colour, and as free of the rock as possible.

Emery fused with lead, and iron, hardens them. It is also said to increase and heighten the weight and colour of gold. It is usual to mix a little of it with the gold from Madagafcar, which is naturally pale and soft. See **GOLD**.

Emery is said to have a corroding and almost caustic quality; but this is without any just foundation. It is recommended by the ancients as an affrigent and densific. In this last intention, however, it must be used with great caution, as its hardness and sharpness are such, that it will be apt to wear off the enamel of the teeth.

Emery, *partly of*, is a kind of a dirty matter, found on the lapidaries wheels; containing part of the powder of *emery* which they use.

EMETIC, from *emetus*, *I vomit*, in *Medicine*, a remedy that excites vomiting; or that purges the stomach by the mouth.

Of these there is a great variety; as *ipocucanum*, *carduus benedictus*, &c. The use of *emetica* is indicated by a foulness of the mouth in a morning, retching, loathing, gnawing of the stomach, gradual loss of appetite, spontaneous vomiting, &c.

Vomiting is raised by irritating the spirits with the presence of something loathed; by an unusual agitation, as fasting, &c. by tickling the fibres of the fauces and pharynx with a feather dipped in oil; by drinking quantities of warm water, &c. by any thing sharp and viscid; as the flowers and seeds of dill, leaves of groundsel, &c. crocus, and glass of antimony; the flowers and regulus thereof; mercurius vitæ, mineral turbit, and mercury sharpened any way with acids.

The ancient physicians were very fond of *emetica*, as preservatives against diseases; and Hippocrates, in particular, has recommended the giving them twice a month, during winter, and in the spring. His *emetica* were very easy, simple, and gentle ones. One very common prescription, to this purpose, was a decoction of hyssop, with an addition of so much vinegar and salt as would make the patient nauseate it. This was to be taken by strong and robust people, in the morning, fasting, and, by the more weakly, after dinner or supper. Dioscorus Siculus has assured us, that the great practice of the ancient Egyptian physicians consisted in glysters, vomits, and abstinence. Asclepiades, who was a great enemy to purges, yet often ordered his patients gentle vomits after supper.

The *emetic* medicines are of two very different kinds, some being naturally mild and gentle, others harsh and rough; of the former kind, warm water with butter, or the water of the naturally warm mineral springs, are often capable of doing very great service. The medicine of most general use at present, *ipocucanum*, seems of a happy middle nature between these and the more rough ones, of which the vegetable kingdom affords us a great number, as *asarabacca*, white hellebore, gamboge, and all the purges in too large doses. The mineral world, however, affords much more numerous and more violent ones: such are all the preparations of copper, and of the vitriols, the antimonial vomits, and the mercurial ones.

The ancients, in violent diseases, such as mania, epilepsies, and some other disorders, not attended with a fever, gave the white hellebore root as an *emetic*, with great success; but we now use remedies less dangerous, as death has been sometimes known to have been the effect of this medicine. Our *ipocucanum* is a celebrated remedy for fluxes; nor is the observation new, that vomits are the greatest of all remedies in these cases. Celsus, lib. 1. cap. 3. affirms, that vomits in general stop fluxes, yet always keep the body open. The country people, with us, frequently use *asarabacca* as a succedaneum for the *ipocucanum*. It is rougher, indeed, than that medicine, but, if taken in decoction, the boiling carries off its acid and too pungent quality, and it retains its *emetic* power in a more gentle degree, and, with it, has a balsamic and corroborating virtue, and has been known to cure inveterate quartans, and to do great service in jaundices and dropsies. Among the antimonial vomits, the best is the *emetic tartar*, prepared from the crocus metallorum, not from the glass of antimony, for that makes it doubly rough and harsh in its operation. Three or four grains of this alone, or yet less of it, mixed with *ipocucanum*, are often given with great success; and when the intention is to purge and vomit at the same time, then three grains of this *emetic tartar*, added to a solution of manna, prove an excellent medicine. In athematic and pituitous cases, the osymel of squills is a very efficacious and perfectly safe medicine; but all the preparations of copper, and the rougher antimonial vomits, are to be rejected, as being very dangerous and very uncertain, working either too little, or greatly too much, according to the state of the humours in the stomach. The stronger *emetica* before mentioned, as *ase* ones, are often necessary in cases of poison, especially of the narcotic

erotic kind, and the infectious particles received from the effluvia of persons in contagious diseases, which being swallowed into the stomach with the spittle, would otherwise infallibly create the same disease. In disorders arising from a vitiated or thick bile, formed, as it were, into a kind of viscid coagulum, and stopping up the biliary ducts, as is the case in jaundice, and some other complaints, *emetica* are frequently used with great success, after all the common methods have failed. In anasarca, alio and leucoplegmatia, and excrementitious swellings of the parts, and in a curable ascites, *emetica*, exhibited in large doses, usually carry off by stool, though rarely by vomit, the aqueous serum from the liver, and the ducts and glands of the intestines, mesentery, and pancreas; nor are these the only cases in which *emetica*, properly administered, are capable of doing very singular service; but there still requires great care and caution in giving them, as it is an infallible rule, that the medicine which can do great good, may also do great harm. Hoffm. Medic. Rational. Syll. §.

It is proper, in order to make *emetica* work the more easily, always to give them in a liquid form, or in a sufficient quantity of some moistening, relaxing, and fatty vehicle; for vomiting not only requires a strong contraction of the pylorus, and bottom of the stomach, but also a relaxation of the superior orifice of the oesophagus. During the operation of *emetica*, and after it is over, the patient must be carefully guarded against the cold, and abstain from all cold liquors, from all hot or stimulating medicines, and from all violent exertions of the mind; and about four hours after the operation of a vomit is over, it is extremely proper to drink half a pint of alkali milk, if it can be readily had.

Whenever bleeding and vomiting are both necessary, bleeding should always be done first.

The ancients in general, have recommended the giving of vomits in tertiana and quartana, before the access of the fit; and Alexander Trallian has been very earnest in recommending them on this occasion. The practice is highly consonant with reason, and all the known rules, and may be of great advantage, not only in these, but in many other cases, in which it is not at present thought of.

Dr. Harris has observed of the antimonial vomits, that they are very safe in the heat of summer, but very dangerous in colder seasons. This author also recommends a decoction of the herb digitalis, or fox-glove, as a very safe, though powerful *emetic*; and there is an account of another plant actually esteemed of the dangerous kind, that is, the common creeping meadow-crowfoot, from which a very safe and efficacious *emetic* is to be prepared, that has been administered in many parts of England with great success. The method of preparing it is only by distilling, in the common way, a simple water from the plant; this is very useful and innocent to the sick, and requires to be lowered, either by showing a very large quantity from a little of the herb, or else by mixing common water with it. The method of giving it is this: let the patient drink about a quart of warm water, then give an ounce of this distilled water, and the whole will be immediately brought up with great ease; and the whole operation is then over for that dose, and the water and medicine are again to be repeated as often as is judged necessary. Harris's Dissertation.

If vomits operate too violently, common salt is a well known remedy. This seldom fails to check or stop them. Mild aromatics and opiates also have the same effect; and corroborating medicines, either taken internally, or applied by way of cataplasms, or embrocations, to the region of the stomach.

Dr. Shaw thinks, the most safe, gentle, and agreeable *emetic* yet known, is an infusion of the ipecacuanha-root in white wine, without heat. This is made by putting two drams of the root, in fine powder, into half a pint of white Lisbon wine, and, after standing two days, adding a fresh quantity of wine to the remaining powder, when this is poured clear off. These wines are to be mixed together, and given in a dose suited to the strength of the patient. This is greatly preferable to the vinum benedictum, *emetic tartar*, and all the medicines of a like kind, which are attended with danger and uncertainty in their operation; and while we have this, there is no reason why all the violent *emetica* should not be wholly discarded from the practice of physic. Shaw's Lectures, p. 221.

The *EMETIC WINE*, *VINUM EMETICUM*, is only white-wine, wherein is infused some crocus, metalorum, or glass of antimony.

Small doses of *emetic wine* have been recommended in debilitant and sordid in low fevers, in many chronic diseases, and especially in an obdurate rheumatism. See Medic. Ess. Edinb. ed. vol. I. p. 170. and Huxham. Obs. de Acute & Morb. epidem.

The *EMETIC powder*, called also *pulvis de Auroch*, from the name of its author, is a precipitate of antimony; or butter of antimony sweetened and softened by repeated lotions.

EMETIC tartar, is prepared from equal parts of crocus metallorum, and cream of tartar, boiled together in water, afterwards filtrated and crystallized. See CRYSTALL and TARTAR.

The operation of *emetic* medicines is thus accounted for by Dr. Quin: the particles of the *emetic*, wedging themselves into the orifices of the emulsaries of the glands, placed adjacent to the surface of the stomach, do dilate the same (which by some extrinsic cause had been contracted); and after the same manner do dilate (at least in some degree) the cohesion of the stagnant morbid matter; rendering it more fluid, and consequently making its resistance less.

Now the natural and constant action of the glands being secretion, and the impediment by the distention of the orifice, and the attenuation of the fluids being taken away, or at least made less than the natural momentum of the glands; the matter must naturally flow into the cavity of the stomach, till it be heaped up in such quantity (which not being to be done in an instant, must require some time) as is sufficient, by its stimulus, to vibrate and force the fibres of the stomach, abdomen, and diaphragm, by communication of the fist with the two left, into a violent contraction, and thereby throw all out by the oesophagus; and this makes all quiet for a time, till a new and sufficient quantity be excreted from these glands to produce the aforesaid contraction.

Thus there happen fits of vomiting and quiet alternately, till either all the morbid matter be thrown out, or the force of the *emetic* be dissipated, that it is no longer able to draw out the morbid matter from the glands.

And the strong contraction in so many muscles, and muscular carnis, as are at work in the action of vomiting, and the violent concussion which is produced all over the whole body by a power, which, by full completion, is not inferior to 20,000 lb. weight, may, and often does, take away the obstruction in many other canals, besides those which are adjacent to the stomach and gullet; as we plainly see by those vast sweats, which urgent fits of vomiting occasion.

Emetic and purgative medicines differ only in this, that the particles of the latter do not immediately relaxate the fibres of the stomach, dilate the orifices, and attenuate the matter contained in the glands of the stomach; but act gently, and assist the natural motion of digestion, and to be carried down into the guts; and how they operate there, see Purgative.

EMEU, in Ornithology, the common name of the CASSOWARY, a large bird of the ostrich kind.

EMINENCE, in Geography, a little hillock, or ascent, above the level of the adjoining clayey sea.

EMINENCE is also a title of honour given to cardinals.

The decree of the pope, whereby it is appointed, that the cardinals should be addressed under the quality of *eminents*, bears date the 10th of January, 1650. They then laid aside the titles of *illustrious*, and *reverendissimi*, which they had before.

The grand master of Malta is likewise addressed under the quality of *eminent*.

The popes John VIII. and Gregory VII. gave the same title to the kings of France. The emperors have likewise borne it.

Eminentissimo, the superlative of *eminent*, hath of late been attributed to the cardinals.

EMINENTIAL equation is used by some algebraists in the investigation of the areas of curvilinear figures; for a sort of artificial equation, containing another equation eminently. Hayes, Flux. p. 97.

EMINENTLY, *EMINENTER*, in the Schools, is used in contradistinction to *formally*, and in the same sense with *virtually*, viz. to denote that a thing possesses, or contains, any other in a more perfect or higher manner than is required to a formal possession thereof.

Thus an angel is said to have prudence *eminently*; as he has it in a higher and more perfect degree than it is in man, in whom it is formally.

For one thing to contain another *eminently*, there are usually required two conditions. 1. That the containing be of a more excellent nature than the contained. 2. That the less excellent be some way contained in the more excellent; viz. either as its productive cause, or by some similitude, or as to the manner and order of acting, &c.

EMIR, a title of dignity, or quality, among the Turks and Saracens, attributed to such as are relations or descendants of their great prophet Mahomet.

The word is Arabic, and literally signifies *prince*. It is formed of the verb *amar*, *amar*, which is originally Hebrew;

Hebrew: and in both these languages signifies to say, and to command.

The *emirs* are held in high veneration, and have alone the privilege of wearing a green turban. On the borders of the Holy Land, there are several *emirs*, foreign princes; as the *emir* of Gaza, and the *emir* of Terabeh, over whom the great sultan has but little authority. The title *emir*, at first, was only given to the caliphs: in Persia they were also called *emir nash*, q. d. prince's son; whence by abbreviation of *emir*, they formed *mir*, and of *emir nash*, *miran*. In after times, when the caliphs had assumed the title of sultan, that of *emir* remained to their children, as that of Cæsar did among the Romans.

At length, the same title of *emir* came to be attributed to all who were judged to descend from Mahomet by his daughter Fatimah, and who wear the green turban.

Emir, is also a title, which being joined to some other word, frequently denotes an office or employ: as the *emir al amra*, commander of *amman*, who, in the time of the caliphs, was chief of the council and armies. The appellation *emir* is also applied by the Turks to all viziers and bailiffs, or governors of provinces. See *HASHAW*, &c. And, that *emir al amra*, vulgarly *amra*, is master of the bath in the great capital.

Emir al em, vulgarly *emir al em*, is master and director of all the fountains of the empire.

Emir kassar, the provost, or superintendent of the market, who regulates the prices of provisions.

The *emir kassar*, or prince confessor of the pilgrims of Egypt to Mecca, is bishop of Jerusalem, and is named yearly from Constantinople, though he is generally left two years in his office, to make amends for his great expense in equipping in the first, and sometimes, if he has capacity and interest at the Porte, he is continued five years, but rarely longer; for if they could the caravan seven years, the grand sultan presents them with a collar of gold, and it is said, that their persons, after this, become sacred, and they cannot be publicly cut off. This officer has command over the others that go to Mecca. The perquisites of his office, before what he is allowed by the Porte, consist in having a tenth of the effects of all the pilgrims who die in the journey. Pococke's Egypt, p. 185.

Emir al muslimin, or *emir al muslimeen*, i. e. commander of the faithful, or the believers, was a title assumed by the Almohades and Almoravides, who reigned in Africa and Spain.

EMISSARIUM, in *Antiquity*, a fount, or drain, to draw off the water used in watering gardens, fields, &c.

EMISSARY, formed of *e* and *mitter*, q. d. *I put out*, a traitor, devious, and person, sent secretly, to sound the sentiments and views of another, to make him form a plot or overture; or to spread reports, watch the actions, motions, and countenance, of a contrary party or person, in order to make advantage of them all. See *SPY*. The leaders of parties have abundance of emissaries employed in their service, who inform them of what passes everywhere, that they may take their measures accordingly.

EMISSARY of a gland, the same with *excretory duct*, being the common canal, or pelvis, in which all the little secretory tubes of a gland terminate.

EMISSION, the act of throwing, or driving a thing, particularly a fluid, from within, outward. The ancients took vision to be performed by the *emission* of visual rays from the eye.

But the term *emission* is chiefly applied among us, to the expulsion or ejaculation of the seed.

EMITES, in Natural History, the name used by some authors for the *chermites*, a beautiful species of white marble, of which the tomb of Darius and many other of the great works of antiquity were made. It was valued for its fine polish.

EMMELLA, *Emmella*, in *Antiquity*, a dinner peculiar to virgins, which had all the gravity and dignity that were suitable to the station they represented, and was designed to inspire the audience with sentiments of compassion and benevolence for the unfortunate and oppressed, with indignation against the guilty, and with the love of virtue, and abhorrence of vice.

The movements of such a dance as this must have been very solemn and majestic, and have bore a great affinity to the action of an orator; it was the only one, excepting the military dances, that had the approbation of Plato. Mem. Acad. Inscrip. vol. ii. p. 160. See *DANCE*.

EMMENAGOGUES, *Emmenagoga*, in *Medicine*, such remedies as promote the menses.

They are thus called from *em*, in, *menstrua*, *menstrua*, *menstrua*, *menstrua*, because their natural period of flowing is once a month.

Emmenagogue either act, by giving a greater force to the blood in its circulation, whereby its momentum against the vessels is increased; or by making it thinner, whereby it will more easily pass through any outlets.

The former intention is helped by chalybeates, which give a greater weight and momentum to a languid heavy blood, and all other substances of the like gravity and elasticity; and such is the case of a leuco-phlegmatic habit, or, as it is commonly called, the green-tickets, and its cure.

But in the latter case, where the blood is florid, and too high, attenuating alteratives and detergent are the only remedies, because fitted to render the blood more thin, and to give it such a property, as will better carry it through those little apertures destined for its discharge into the uterus.

EMMELLURE, in the *Mange*, a kind of composition of honey, and other ingredients, used for sprains and shoulder-blains of horses. See *CHANGE*.

The word is French, derived from *em*, *hazy*, which is a part of the composition.

EMODIA, *Emodia*, or *emodia*, *emodia*, and *emodia*, in *Medicine*, a word used by some authors to express a diaphor of the teeth.

EMOLLIENTS, in *Medicine* and *Pharmacy*, remedies used to soften and loosen indurations or contractions of the belly, or those of tumors and swellings: such are mallow, mercurial, lily-root, linseed, butter, wax, gum ammoniac, &c.

The term *emollient* is applied to external as well as internal remedies. We say, a *heative*, *anodyne*, and *emollient* cylinder, an *emollient* capillary, an *emollient* cataplasm, &c. Fresh cherries are an *emollient* food, though when dry, they rather constringe than relax, as wanting a great part of the phlegm which rendered them *emollient*.

Ripe grapes, from being stringy, which they were before, become laxative and *emollient*. Hogs lard, applied externally, in *colic* and *diarrhea*. Quince defines *emollient* to be justifying a theatre and loosing the apertures of the humors, and relax and supple the solids at the same time; for it is easy to conceive how these fluids be both effected by the *Lane* medicine, thus: by what means force (whether in the stomach, or any other parts) the juices have obtained a diaphor or aperity, so as to relaxate and render uneasy the fibres and nervous parts, which often happens; those things which are smooth, soft, and yielding, cannot but wrap up their points, and render them imperceptible, whereby they may gradually, by the propagation of circulation, be brought to some convenient endurancy, without doing any injury by the way.

Such diaphors of parts, likewise, draws the fibres into spasms, keeps them too tense, and frequently thereby occasions obstructions of the vessel kind.

In all such cases, therefore, *emollients* lubricate and moisten the fibres, so as to relax them into their proper dimensions; whereupon, such diaphors cease.

EMOLUMENT, is properly applied to the profits arising daily from an office or employ.

The word is formed of the Latin, *emolumentum*, which, according to some, primarily signifies the profits redounding to the militer from his milly; of *emul*, *militer*, *in* *grat*.

The patent, or other instrument, whereby a person is preferred to an office, gives him a right to enjoy all the dues, honours, profits, and *emolumenta* belonging thereto.

In our law-books, *emolument* is used in a somewhat greater latitude, for profit, or advantage, in the general.

EMPALEMENT, or *EMPALEMENT*, a cruel kind of punishment, whereby a sharp pole or stake, is thrust up the fundament, and through the body.

The word comes from the French, *emaler*, or the Italian, *emalere*; or rather, they are all alike derived from the Latin, *emul*, *a* *stake*, and the preposition *in*, *in*, *in*.

We find mention of *emulating* in Juvenal. It was frequently practised in the time of Nero, and continues to be so in Turkey.

EMPALEMENT, in *History*, denotes the cup, or outmost part of the flower of a plant, or that encompassing the isolation of the centre.

It is compounded of the three general parts of all plants, the skin, the cortical, and the woody bodies; each cupular being (whether consisting of one or more pieces) of another leaf, and designed to be a guard and a hand to the flower, where it is weak and tenders, so that such plants as have flowers with a firm and strong bill, as tulips, &c. have an *emulature*, nor need any. See *CALYX*.

EMPALEMENT, or *EMPALEMENT*, in *Law*, signifies the writing and entering into a parchment schedule, or roll

roll of paper, by the sheriff, the names of a jury summoned by him to appear for the performance of such public service as juries are employed in.

EMPARELANCE, or **IMPARLANCE**, in *Law*, a desire, or petition in court of a day to consider, or advise, what answer the defendant shall make to the action of the plaintiff.

The civilians call it *petitio indicium*. Kitchen mentions *emparellance general*, and *special*; the first seems to be only that made in one word, or in general terms; *emparellance special*, is where the party requires a day to deliberate, adding these words, *Saluti omnium adiuvantibus tam ad jurisdictionem curie, quam ad brevia & narrationes.*

Briton also uses *emparellance* for the conference of a jury upon a cause committed to them.

EMPASMA, *Empasma*, from *empono*, I sprinkle, in *Pharmacy*, a powder thrown or sprinkled over the body, to correct some ill humors thereof, or to prevent unnecessary sweats.

EMPASTING, or **EMPASTING**, a term used in *Painting*, for the laying on of colours thick and bold, or applying several lays of colours, so that they may appear thick. See **COLOURING**.

It is formed of the French, *empaster*, which has the same signification of *paste*, or *paste*.

A painting is said to be well empasted, with colours, when the colours are bestowed plentifully, or it is well soaked, and saturated with colours.

The term is also used when the colours are laid distinct, and stunder, and not softened and lost in each other: e.g. this head is not painted, it is only empasted.

EMPAITEMENT, French, from *emporter*, to shrike, in *Philosophy*, a term used by some to denote the fame with **TRUTH**.

EMPERESS, **EMPERY**, *Imperatrix*, the feminine of *emperor*, applied either to an emperor's wife, or to a woman who rules singly over an empire, with all the authority of an emperor; as the empress of Russia. See **EMPEROR**, **QUEEN**, &c.

EMPERESS, is also used in the *Antient French Poetry*, for a particular kind of rhyme, thus denominated by way of excellence.

The rhyme *emperesse* was a sort of crowned rhyme, wherein the syllable that made the rhyme was immediately preceded by two other like syllables of the same termination, which made a kind of echo, called the *triple empress*; and which, to the flame of the nation for some of their late authors express it their best ancient poets took for a wonderful beauty and excellence.

Fr. Mourgues, in his treatise of French poetry, gives us an instance very proper to raise contempt of the miserable state of that age, which knew no way of expressing that the world is impure, and subject to change, so excellent, as by saying,

Qu'en tu s'animant, monde, ends.

EMPERICHORISIS, see **CIRCUMCISION**.

EMPEROR, *imperator*, among the *Antient Romans*, signified a general of an army, who, for some extraordinary service, had been complimented with this appellation. Thus Augustus having obtained no less than twenty famous victories, was at length saluted with the title *imperator*; and thus was denominated *emperor* by his army, after the reduction of Jerusalem.

Afterwards it came to denote an absolute monarch, or a supreme commander of an empire: a Roman *emperor*, &c. In this sense Julius Cæsar was called *emperor*, and the title denoted with the dignity to Octavius Augustus, Tiberius, and Caligula; and afterwards it became elective.

In strictly, the title *emperor* does not, and cannot add any thing to the rights of sovereignty; its effect is only to give precedence and pre-eminence above other sovereigns; and as such, it rather thro' itself travelled with it to the summit of all human greatness.

The *emperors*, however, pretend, that the imperial dignity is more eminent than the royal; but the foundation of such prerogative does not appear: it is certain, the greatest, most ancient, and absolute monarchs, as those of Babylon, Persia, Assyria, Egypt, Macedonia, &c. were called by the name of *king*, in all languages, both ancient and modern. See **KING**.

It is disputed, whether or not *emperors* have the power of disposing of the royal title. It is true, they have sometimes taken upon them to erect kingdoms; and thus it is that Bohemia and Poland are said to have been raised to the dignity; thus also, the emperor Charles the Fifth, in the year 1525, gave Provence to his son, putting the diadem on his head, and decreeing him to be called *king*. *Un mare priferum imperatorum regibus videtur dominari.*

Add, that the emperor Leopold erected the dual Prussia into a kingdom, in favour of the elector of Brandenburg; and though several of the kings of Europe re-

fused for some time to acknowledge him in that capacity, yet by the treaty of Utrecht, in 1712, they all came in.

In the East, the title and quality of *emperor* are more frequent than they are among us; thus, the sovereign princes of China, Japan, Mogul, Persia, &c. are all *emperors* of China, Japan, &c.

In the year 1723, the czar of Moscow assumed the title of *emperor of all Russia*, and procured himself to be recognized as such by most of the princes and states of Europe.

In the West, the title has been a long time restrained to the *emperors* of Germany. The first who bore it was Charlemagne, who had the title *emperor* conferred on him by pope Leo III. though he had all the power before.

The imperial prerogatives were formerly much more extensive than they are at present. At the close of the Saxon race, A. D. 1024, they exercised the right of conferring all the ecclesiastical benefices in Germany; of receiving the revenues of them during a vacancy; of succeeding to the effects of deceased ecclesiasticals; of confirming or annulling the elections of the popes; of assembling councils, and of appointing them to decide concerning the affairs of the church; of conferring the title of king on their vassals; of granting vacant fiefs; of receiving the revenues of the empire; of governing Italy as its proper sovereign; of erecting free cities, and establishing fairs in them; of assembling the diets of the empire, and fixing the time of their duration; of coining money, and conferring the same privilege on the states of the empire; and of administering both high and low justice within the territories of the different states; but in the year 1555, they were reduced to the right of confirming all dignities and fiefs, except the privilege of being a duke of the empire; of *primaries*, or of appointing once during their reign a dignity in each chapter, or religious house; of printing dispensations with respect to the age of majority; of erecting cities, and conferring the privilege of coining money; of calling the meetings of the diet, and presiding in them. (Hérel Abregé de l'Histoire d'Allemagne, p. 160 & 557.)

To which some have added, 1. That all the princes and states of Germany are obliged to do them homage, and swear fidelity to them. 2. That they, or their generals, have a right to command the forces of all the princes of the empire, when united together. 3. That they receive a kind of tribute from all the princes and states of the empire, for carrying on a war which concerns the whole empire, which is called the *Roman mite*. For the rest, there is not a foot of land, or territory, annexed to this title; but ever since the reign of Charles IV. the *emperors* have entirely depended on their hereditary dominions as the only source of their power, and even of their subsistence. See **DILE** and **ELECTORS**.

The kings of France were anciently also called *emperors*, at the time when they reigned with their sons, whom they associated to the crown; thus, Hugh Capet, having associated his son Robert, took the title of *emperor*, and Robert that of *king*; under which titles they are mentioned in the history of the council of Rheims, by Gerbert, &c. King Robert is also called *emperor* of the French, by Helgau of Picardy. Lewis le Gros, upon associating his son, did the same. In the first Register of the King's Charters, fol. 166. are found letters of Louis le Gros, dated in 1116, in favour of Raimond, bishop of Maguelonne, wherein he styles himself *Ludovicus Dei gratia presidentia, Francorum imperator Augustus*.

The kings of England had likewise anciently the title of *emperors*, as appears from a charter of king Edgar: *Ego Edgarus Anglorum Sclavorum, Saxonumque regum imperator totiusque Britanniarum circumscriptus, &c. imperator & dominus*.

Add, that we say the king of England, *Omnes fideles, possessiones regis sui quam imperator condidit in imperio*; whence the crown of England has been long so designated in parliament to be an imperial crown.

EMPEROR, among *Hebrew Grammarians*, is an appellation given to a species of accents, serving to terminate a sense completely, and answers to our point. See **ACCENT**.

EMPEROR dead, see **ELDER**.

EMPEIRON, in *Botany*, a name by which some authors, as Dodonæus, &c. have called the kali or glass wort. Ger. Emac. Ind. 2. See **KALI**.

EMPEIRON, in *Botany*, see *Barb-bearing Heath*.

EMPEROR, is also a name used by some authors for the abeyance, commonly called hereternity.

EMPHASIS, in *Rhetoric*, a forcefulness, or energy, in expression, action, lecture, or the like, which performs the same office in sentences as the accent does in words. The word is Greek, *émpasis* which signifies the same. See **ENERGY**.

Some consider *emphysis* as a figure whereby a thing is represented in the finest and strongest terms; such, e. g. is that of Augustus, *Forum elevatum calcestratus*, which is much more enervical, than if he had said, *Stadisi molitumque infans auct.*

The necessity of observing propriety of *emphysis* is to great that the true meaning of words cannot be conveyed without it.

Emphysis is of two kinds, simple, or complex. The former serves to point out the plain meaning of any proposition; the latter also marks some affection or emotion of the mind, by the use of which a discourse receives life and spirit, and is rendered capable of producing the noblest effects. See Sheridan's Lectures on Elocution, lect. 11.

EMPHATICAL, is used by the *Ancient Philosophers*, to express those apparent colours which are often seen in clouds before the rising, and after the setting of the sun; or those in the rainbow, &c.

These, because they are not permanent and lasting, they will not allow to be true colours; but, since these *emphatical* colours are light modified chiefly by refraction and with a concurrence of reflection, and some other accidental variations, and since they are the proper objects of sight, and capable as truly to affect us as other permanent colours are, there is no reason for excluding them from the number of true and genuine colours, since all other colours are only modifications of light, as these are.

EMPHREPYRA, in *Natural History*, a genus of *Stercoraria*, composed of various sorts of coms, surrounding a nucleus of the same matter and structure with themselves. See *SIDERICHTA*.

Of this genus we have five species. HIP'S Hist. Fossils, p. 532.

EMPHRACIC, in *Pharmacy*, the time with *emphysis*.

The word is formed from the Greek, *εμφρασις*, I stop.

EMPHRAXIS, in *Medicine*, an obstruction in any part.

EMPHRAUE, in *Botany*, the name given by the people of Guinea to a species of tree, the leaves of which they boil in wine, and give as a great restorative in cases of weakness and decay. Its leaves are exactly of the shape of those of the common mulberry, but they are not indented at the edge. Peitner has thence called it *arbor Guineensis* *arbor faina* *arbor cretica*. Philol. Trans. N° 237.

EMPHYSEMA, *εμφυσμα*, from *πναιω*, I inflate, in *Medicine*, a windy swelling, or bloating, of the whole outer habit of the body, like that in the parts of divers animals when blown up, after they are killed.

This word, though appropriated by some writers to a soft tumor, arising from air contained in the cavities of the membrana cellulosa, is used by Hippocrates to express an inflation of the belly; and in some parts of his writings, in a more general sense, for any tumor.

The wind, or air, which is the matter of the *emphysma*, is lodged under the cutis, and principally in the cellular adipose.

Hence the seat of the *emphysma*, or the place wherein the wind is chiefly lodged, is in the adipose cells, under the skin covering the thorax. The ordinary occasion is some wound in the thorax, whereby the pleura is pierced, or the lungs are lacerated. Putridity is also a cause of this disorder, as is seen in mortifications of the external parts, and in many instances of putrid fever.

Mr. Littre accounts for it thus: when a person is wounded in the breast, there enters air in at the wound; now, it may happen, either from the narrowness of the wound, or the flesh's closing again readily, or some other cause, that the air thus admitted cannot readily get out again, at least not all of it; and thus air comes to be enclosed in the capacity of the breast.

Now, at every inspiration, the lungs are to fill this capacity, by their swelling with the air which is naturally received; but here they cannot swell without pressing upon the other extraneous air: the consequence of which is, that this latter is made to slip between the interstices of the fleshy fibres, and perhaps to enter the little oscula of the minute veins, or lymphatics; immediately, another force comes to take place, contrary to that of inspiration, viz. expiration; in this, the breast contracting itself, presses the extraneous air still more than the lungs had done in their dilatation; and the two opposite moments, or actions, conspire to the same effect.

Mr. Meiy and Dr. Hunter are of opinion, that the air is forced into the cellular membrane only during expiration.

The air, thus continually impelled, will be propagated along the passages it first opened for itself, till at length it meets, and becomes collected in some place: now this place must be the cellulae of the fat, rather than anywhere else, because of the thinness and flexibility of their membranes; and as the air came from within the cavity of the breast, it will be in the fat that covers the breast

under the skin, rather than elsewhere, that the windy tumor, or *emphysma*, will lie.

Now, such tumor cannot be very considerable, when only formed by the air received in at a wound; but if we suppose the wound to have pierced the substance of the lungs; then, besides the air taken in by the wound, there will be part of that taken by inspiration; so much as was contained in the bronchia, or vesicular, thus perforated or opened, escaping into the cavity of the breast, and driven along with the former into the flesh; and as a fresh quantity of this is supplied every moment, there will be a continual accession, so long as the wound of the lungs remains open.

Hence, an *emphysma*, from a wound in the lungs, sometimes possesses the whole habit, the air being carried to all the parts of the body.

Mr. Littre supposes, that the air of an *emphysma* from wounded lungs may be partly air taken up by the pulmonary vessels, and thrown from the arteries into the cellular membrane by a kind of secretion; but Dr. Hunter observes, that this is in the highest degree improbable; and that there is no occasion for having recourse to such winding and obscure passages.

When these tumors happen in putrid disorders, fomentations, with equal parts of sharp vinegar and rectified spirit of nitre, may be applied to them; but if they are caused by a wound, bleeding is necessary, which should be repeated whilst the breathing is quick and laborious; punctures, or small incisions may be made into the cellular membrane, or in different parts of the body, with a lancet, by which operation the air will be excluded, if the tumor is gently pressed. When the air is thus evacuated, a compress may be dipped in vinegar, and applied to the part which is supposed to be wounded: this may be secured by a tight bandage, and the patient ordered to lie on the injured side, in order to prevent a fresh influx of air. Internal suppurations may be prevented by nitre, and pectoral emulsions. When the air is lodged in the cavity of the breast, Mr. Hewson proposes to discharge it by a small opening made with a knife on the fore-part of the chest, between the fifth and sixth ribs, on the right side, because the integuments are thin; or between the seventh and eighth, or eighth and ninth ribs on the left side, to avoid wounding the pericardium. Mem. Acad. Sci. 1713. Lond. Med. Observ. dec. vol. ii. art. 2. p. 17, &c. and vol. iii. p. 28. 35. 372. 397.

EMPHYTEUSIS, in the *Civil and Canon Laws*, the letting out of poor barren lands for ever, or at least for a long term of years, on condition of the tenants cultivating, meliorating, or mending them, and paying a certain yearly consideration.

The word is formed of the Greek, *εμψυτευσις*, which signifies an *engraftment*, and by metaphor, a *melioration* or *amendment*; for as we only graft trees to mend them, to a man only alienates his land by *emphyteusis*, on condition of having it amended.

Emphyteusis are a kind of alienations, differing from sales, in that they only transfer the *dominium utile*, the benefit of the ground, not the property, or fee-simple. Among the Romans they were at first temporary, afterwards perpetual.

The twentieth canon of the council of Carthage prohibits the bishops seizing the church's *emphyteusis* out of the hands of private persons, unless they have been three years without paying rent.

EMPIRE, the territory or extent of land under the command and jurisdiction of an emperor. See *EMPEROR*.

We say, the Roman empire, the empire of the East, the empire of the West, or the western empire, the empire of the Great Mogul, &c.

Antiquaries distinguish between the medals of the *upper* and *lower* empires: the curious only value those of the *upper empire*, which commences with Cæsar or Augustus, and ends in the year of Christ 260.

The *lower empire* comprehends near 1200 years, reckoning as low as the destruction of Constantinople in 1453. They usually distinguish two ages, or periods, of the *lower empire*: the first beginning where the upper ends, viz. with Aurelian, and ending with Anastasius, including 200 years; the second beginning with Anastasius, and ending with the Palæologi, which includes 1000 years. See *MEDAL*.

In ancient history we read of four great monarchies or empires, viz. that of the Babylonians, Chaldeans, and Assyrians; that of the Medes and Persians; that of the Greeks; and that of the Romans. The first subsisted from the times of Nimrod, who founded it in the year of the world 1800, according to the computation of Usher, to Sardanapalus their last king in 3257; and consequently lasted about 1450 years. The empire of the Medes commenced under Arbace, in the year of the world 3257, and

and was united to that of the Babylonians and Persians under Cyrus, in the year 3458, and it closed with the death of Darius Codomannus in 3074. The Grecian empire lasted only during the reign of Alexander the Great, beginning in the year of the world 3674, and terminating with the death of this conqueror in 3681, his coheirs being divided among his captains. The Roman empire commenced with Julius Cæsar, when he was made perpetual dictator, in the year of the city 708, and of the world 3956, forty-eight years before Christ. The seat of the empire was removed to Byzantium by Constantine, in the year of our Lord 334: the East and West were then united under the title of the Roman empire, all the Romans proclaimed Charlemagne emperor, A. D. 800. From this epoch the East and West formed two separate empires; that of the East governed by Greek emperors, commenced A. D. 802, and being gradually weakened, terminated under Constantine Palæologus in 1453. The Western empire was afterwards known by the appellation of the empire of German emperors.

EMPIRE, or the *EMPIRE*, used absolutely, and without any addition, signifies the empire of Germany, called also its juridical acts and laws, the *holy Roman empire*, S. R. I. q. d. *sanctum imperium Romanum*, which constitutes what we otherwise call the *Germanic body*.

The empire had its beginning with the ninth century; Charlemagne being created first emperor by pope Leo III. who put the crown on his head in St. Peter's church on Christmas-day, in the year 800.

Authors are at a loss under what form of government to range the empire; some of them will have it a monarchical state, because all the members thereof are obliged to alk the investiture of their states of the emperor, and to take an oath of fidelity to him.

Others maintain it a republic, or aristocratic state, because the emperor cannot resolve or determine any thing, without the concurring suffrages of the princes. It is added, that if they require investiture from, and swear fealty to him, it is only as head of the republic, and in the name of the republic, and not in his own; just as at Venice, every thing is transacted in the name of the doge. See *DOGE*.

Lastly, others will have the empire to be a monarcho-aristocratic state, i. e. a mixture of monarchy and aristocracy; because, though the emperor in many cases seems to act sovereignly, yet his decrees and resolves have no force, in case the state refuse to confirm them.

In fine, we should rather choose to call it an aristocratic state, because the duty, wherein the sovereignty is lodged, is composed of princes, and the deputies of the cities; and is divided into three orders, or bodies, called *colleges*, viz. the college of elections, the college of princes, and the college of cities.

We say, *colleges* of the empire, circles of the empire, *hefts* of the empire, princes of the empire, electors of the empire, members of the empire, expulsioms of the empire, recesses of the empire, &c. See *DISTRICT*, *CIRCLE*, *PRINCE*, *CAPITULATION*, and *RECESS*.

The states, or estates of the empire are of two kinds, *mediate* and *immediate*. The *immediate* states are those which hold immediately of the empire, whereof, again, there are two kinds; the first, such as have seats and voices in the imperial diet; the second, such as have none. The *mediate* states are those who hold of the *immediate*.

The states which now compose the empire are the princes of the empire, the counts of the empire, the free barons of the empire, the prelates of the empire, the princebiss or abbesses of the empire, the nobles of the empire, and the imperial cities.

EMPIRIC, a name given by antiquity to such physicians, as formed for themselves rules and methods on their own practice and experience, and not on any knowledge of natural causes, or the study of good authors; and who prescribed, without enquiring into the nature of the disease, or the properties and virtues of their medicines; depending wholly on the authority of some general experienced remedies.

The word is formed of the Greek, *ἐμπειρία*, and that of *ἐμπειρος*, *impeiros*, *wise*; but particularly knowing and learned by experience; the root being *εμπε*, *empe*, or *experience*.

Medicine was almost altogether in the hands of empirics till the time of Hippocrates, who first introduced reason, and the use of theory therein: and hence there arose a new sect, called *rationalists*.

Pliny relates, that the sect of empirics had its rise in Sicily; the first who professed it, he says, were Apollonius and Glaucias; others say, Acron Argæticus. They and their followers made great opposition to the dissection of human bodies; and particularly in that practised by Hierophilus and Erasistratus, on living bodies of cri-

minals who were condemned to death; but the word *empiric* is now more odious than ever, being confounded with that of *charlatan*, or *swindler*, and applied to persons who practise physic at random, without a proper education, or understanding any thing of the principles of the art.

Indeed it is possible, the word may be abused even on this side of the question; for those of the physicians fervently attached to the train and method of the school, the reasonings of Hippocrates and Galen, and the statutes of the faculty, we all know, have been ever forward to treat those who think more freely, and are less filially devoted to antiquity, custom, and the reigning practice or mode, as *empirics*, *charlatans*, and *quacks*. See *MEDICINE*.

EMPIRIS, in *Natural History*, the name given by authors to a large species of snail, found about rivers and ponds; it is distinguished from all other kinds, by a circle of white palling round the middle of its body.

EMPLASTER, popularly called *PLASTER*, a medicine of a thick, glutinous consistence, composed of divers simple ingredients, spread on leather, or linen, and applied externally.

The word is formed from the Greek, *ἐμπλαστω*, or *emblasato*, *to put in a mass*, or *to form over*; because the *em-plaster* is made of divers kinds of simple drugs, worked up into a thick tenacious mass, or because it covers over the piece of leather or linen to be applied on the part affected.

Emplastors are made up in a strong solid body, that by remaining a long time on the part, the medicinal ingredients they are chiefly composed of, may have time enough to produce their effect.

The drugs used to give a body and consistence to *emplastors*, are usually wax, pitch, gum, fat, litharge, and other preparations of lead.

There are *emplastors* of divers kinds, and used with divers intentions; *stomachic emplastors*; cephalic, hyptic, hepatic, diaphoretic, resolutive, deterrive, emollient, incrimative, astringent, conglutivative, &c. *emplastors*.

In the prescription of extemporaneous *emplastors*, the greatest regard is to be had to that particular consistence which the part can most conveniently bear, whereupon the application is to be made. Thus, *plasters* to the breast and stomach, especially in the intention of emollients or discutients, should be yielding and soft, as in the official *emplastrum flammulicum*; but to the joints, or any of the limbs, where warm discutients and strengtheners are to be applied, an higher and more adhesive consistence is to be sought for.

The emollient *plasters* likewise should be laid on thick, and frequently repeated, if the symptoms continue, because their better parts are soon spent. Discussants also, applied to hard tumors, require repetition; but the strengtheners, which are particularly composed of a strong adhesive consistence, are permitted to lie on till they grow dry, and come off spontaneously.

In some fatal tumors, where a *plaster* alone will not prevail, they are at intervals taken off, and discutient fomentations or lotions made use of, such as are composed of biters, carminatives, comprehending also fixative and alkaline spirits.

EMPLASTRUM adhaesivum, *adhesive plaster*, is prepared by melting together half a pound of the common plaster with a quarter of a pound of Burgundy pitch. The black sticking-plaster, called the *lady's court-plaster*, is formed by dissolving twelve ounces of the gum benjamin in twelve ounces of rectified spirit of wine, and straining the solution. In a separate vessel, dissolve a pound of the best singlals in five pints of pure water; and after straining this solution, mix it with the former, and let them stand in a narrow vessel, that the grosser parts may subside: when the liquor is cold, it will become a jelly, which will melt near the fire when it is to be spread. This quantity will be sufficient for spreading on ten yards of half-yard wide silk; in order to which, the silk must be stretched in a frame, and the mixture may be spread upon it with a sponge or brush, which should be done near a fire. As each spreading dries, it must be repeated to the tenth or twelfth time, and then touched lightly with the brush to give it a gloss. The following more simple preparation may be substituted for the former: dissolve a pound and a quarter of fine singlals in five pints of water, and before it cools spread it on silk in the manner above directed.

EMPLASTRUM anodynum, *anodyne plaster*, is prepared by melting an ounce of the adhesive plaster; and, whilst it is cooling, mixing with it a dram of powdered opium, and the same quantity of camphor, previously rubbed up with a little oil. This plaster gives relief in acute pains, especially of the nervous kind.

EMPLASTRUM atrabile, the *draining plaster*, a plaster ordered in the late London Pharmacopoeia, to supply the

place of the mellilot-plaster, is the dressing of blisters. The college are satisfied, that the herb is of no sort of use in the composition; and that very gross abuses are practised to give the green colour to the plaster; for which reason they have ordered the plaster to be now made in this manner: take yellow resin, and yellow wax; of each three pounds; tread mutton-fat, one pound; melt all together, and strain the mixture while it is hot. Pemberton's Lond. Disp. p. 331.

EMPLASTRUM emmaur, a name given in the new London Pharmacopoeia, to what has been long called *diapylon-plaster*. The apothecaries had been long used to make this by a shorter way than has been prescribed them; and the college has now authorized that method, ordering it to be made of only a gallon of oil of olives, and five pounds of lard, boiled together, with about a quart of water, to keep them from burning, till they are perfectly mixed, and have the consistence of a plaster. Pemberton's Lond. Disp. p. 331.

This plaster is generally applied to slight wounds and excoriations of the skin; it cures the part fast and warm, and defends it from the air, which is all that is necessary in such cases.

EMPLASTRUM emmasticum, or emmasticum, a form of medicine in the new London Dispensatory, ordered to be prepared in the following manner:

Take gum ammoniacum, strained, a pound; quicksilver, three ounces; simple balsam of sulphur, a dram; rub the quicksilver with the balsam of sulphur till it no longer appears; then add by degrees the gum ammoniacum melted, and almost cooled again, and make the whole into a plaster. Pemberton's Lond. Disp. p. 331.

This plaster is recommended in pains of the limbs, arising from a venereal cause. Indurations of the glands, and other violent tumours, are likewise found sometimes to yield to it.

EMPLASTRUM gummi, gum-plaster. Take of the common plaster, four pounds; gum ammoniac and galsbanum, strained, of each half a pound; melt them together, and add for ounces of Venice turpentine. This is used in a digestive, and for dissolving indolent tumours.

EMPLASTRUM rubrum, the strengthening-plaster, a form preferred in the London Dispensatory, and ordered to be made thus: take of the common plaster, two pounds; of frankincense, half a pound; of dragon's blood, three ounces; melt the plaster, and then add to it the other ingredients in powder. Pemberton's Lond. Disp. p. 331.

EMPLASTRUM succinum, stannum plaster. Take of gum-plaster half a pound; camphered oil, an ounce and a half; black pepper, or capicum, one ounce; melt the plaster, and mix with it the oil; then sprinkle in the pepper, reduced to a powder. An ounce or two of this plaster, spread on soft leather, and applied to the region of the stomach, will be of service in flatulencies, arising from hysterical and hypochondriac affections; a small quantity of the expressed oil of mace, or a few drops of the essential oil of mint, may be rubbed upon it before it is applied. Buchan's Domestic Med. p. 737.

EMPLASTRUM vesicatorium, blistering plaster. Take of Venice turpentine, six ounces; yellow wax, two ounces; Spanish flies, in fine powder, three ounces; powdered mustard, one ounce; melt the wax; and while it is warm, add the turpentine, taking care that it be not too much evaporated by heat. After the turpentine and wax are sufficiently incorporated, sprinkle in the powders, continually stirring the mass till it be cold. Buchan. p. 736. See BISTYLE.

EMPLASTICS, in Pharmacy, are salves, or medicines, which stop up and coagulate the pores of the parts they are applied on; or otherwise called *emphratice*. The word is formed from the Greek, *emphratice*, to stop up.

Such are fava, mucilage, wax, the whites of eggs, &c.

EMPLASTRA emetica. See ANASTICA.

EMPHREMATOSIS, from *emphra*, to inflame, in Medicine, a word used by some writers to signify an inflammation of the stomach, but by others, in a more general sense, for inflammations of the womb, or of any other part.

EMPHRETICA charta. See CHARTA and PAPER.

EMPHORIUM, in Medicine, is often used for the common sensory in the brain. See BRAIN.

EMPRIMED, among Sportsmen, a term applied to a hart, when he forsakes the herd.

EMPRION, from *emprion*, to press, in the Medical Writings of the Ancients, a word used to denote a peculiar pulse, in which the artery is felt to be diffended in one part more than another at every stroke, and by that means is made to resemble any serrated body, or the light teeth of a fine saw.

EMPROSTHOTONOS, in Medicine, a kind of tonic con-

vulsion, wherein the head is drawn forwards, till the chin touch the breast.

The word is Greek, composed of *emprothes*, before, and *tonos*, tension, stiffness, of the verb *tono*, I stretch. Sometimes too, it is to general, that the whole body is bent forward, and makes a kind of bow; and even sometimes a kind of circle, the knees meeting the head. The cause of this disorder is a contraction of the anterior muscles, particularly those of the head, called *myotides*. See OPISTHOTONOS.

EMPTOR *semiter*, *heir* of a family, in the Roman Law, one who purchased the inheritance of a person, or the privilege of being appointed his heir by will.

This was done with the ceremony of scales and weights, before five witnesses, with the use of a peculiar formula of words.

Such *heir* differed from the *heir*, *heres*, as the testator in some measure alienated the right to the *semiter* during his own life-time, whereas the latter had only a right by his death. Bignon de Formul. lib. iii. p. 565. Poth. Lex. Ant. tom. i. p. 713. voc. *emptor*.

EMPTOR *semiter*, *semiter* *heir*, one who receives a thing in the way of pledge, till the money he has advanced be repaid. Salmas. de Mod. Ufur. cap. 14. Poth. Lex. Ant. tom. i. p. 713. voc. *emptor*.

EMPOSA, *Empoia*, among the ancients, a kind of hobgoblin, or hobgoblin, under the direction of Hecate, who used to send it to frighten people who laboured under misfortunes. Hofm. Lex. in voc.

EMPHYEMA, in Medicine, a collection of pus, or purulent matter, in the cavity of the breast, discharged either upon the bursting of some abscess or ulcer in the lungs, or membranes that enclose the breast; or formed from that insipidated serum which Dr. Hunter observes is found in large quantities in the cavities of the breast, belly, &c. Lond. Med. Obs. ser. vol. ii. p. 61.

The word is formed of the Greek, *emphra*, to press, the letter *s* being here changed into *ph*, a thing often done when the *n* happens to come in composition before the labials *b*, *p*; as in the words *emphra*, *emphra*, *emphra*, &c.

The *emphyema* sometimes succeeds a quinsy, sometimes a peripneumony, but more usually than either, a pleurisy, as being ordinarily the effect of a peripneumony or pleuritic abscess.

It usually comes fifteen or twenty days after those disorders. Sometimes, also, it is generated of extravasated blood, issued out of a ruptured, broken, or putrid vein; it is distinguished by a difficulty of breathing, a dry cough, a heaviness about the diaphragm, a noise, and fluctuating of the matter upon moving; a slow fever, ruddy cheeks, hollow eyes, the tips of the fingers blue, and a swelling of the abdomen.

The cure is difficult, from the difficulty of absorbing or evacuating such extravasated matter; it nature shows any endeavour to throw it off by vomiting, or urine, or the like, the must be seconded, and assisted therein. Thus, if the urine be purulent, administer diuretics; if the stools, laxatives; if the spitting, expectorants, or even emetics; otherwise, recourse must necessarily be had to a PARACENTESIS, or tapping.

In order to this, an aperture must be made in the thorax, by a proper instrument, on the side affected, between the third and fourth *spurious ribs* on the right side; but on the left, between the second and third, and about half or two-thirds of the distance from the sternum to the vertebra, because here the muscles are thinnest, the artery is concealed under the rib, and the diaphragm is at a due distance; and through this the pus must be slowly drawn.

This operation takes its name from the disease, *emphyema*. There is also a kind of *emphyema*, or *emphyema*, proceeding from a pituitous, or ferrous humour, brought by some duct, or passage into the thorax; where corrupting, it degenerates into a matter like pus.

An *emphyema*, in course of time, breeds a phthisis; and death is often the consequence.

EMPHYREUM, among divines, denotes the highest of the heavens where the blessed enjoy the beatific vision; called also *emphyra*, *heaven*, and *paradise*.

The word is formed of *em* and *phra*, fire, because of its splendour.

EMPHYREUMA. *Emphyreuma*, in Chemistry, &c. a small or tall of burning; a quality, or change in bodies that have been burnt, or much scorched with fire, sensible to the taste and smell, or perhaps it may be some extraneous matter impressed, or added by the fire, and remaining on the burnt or scorched part, thus given the new offensive smell and flavour.

The word is formed of the Greek, *emphra*, to inflame, *indure*.

The term is chiefly used when in boiling or distilling any thing,

thing, it flicks and burns to the bottom of the vessel, or assembles; the offensive smell and taste whereof are expressed by the word *empyreuma*. This term properly denotes a smell of burnt oils; and no other but oily substances can produce it; and it is peculiar to burnt animal and vegetable matters. The *empyreumatic* smell is therefore made a test of the existence of oil in the substances which emit it.

EMPYREUMA, is also used for the heat remaining upon the declension of a fever.

EMRODS, or rather *Hamorrhoids*. See **HAMORRHOIDS**.

EMULATION, is a generous ardour kindled by the brave examples of others, which impels us to imitate, to rival, and, if possible, to excel them. This passion involves in it esteem of the person whose attainments or conduct we emulate, of the qualities and actions in which we emulate him, and a desire of resemblance, together with a joy springing from the hope of success.

The word comes originally from the Greek, *ἐμύλησις*, *emulsi*, whence the Latin, *emulus*, and thence our *emulation*.

Plato observes, of *emulation*, that it is the daughter of envy; in so, there is a great difference between the mother and the offspring; the one is a virtue, and the other a vice. *Emulation* admires great actions, and strives to imitate them; *envy* refuses them the praise that are their due; *emulation* is generous, and only thinks of surpassing a rival; *envy* is low, and only seeks to lessen him.

Perhaps, therefore, it would be more just to suppose *emulation* the daughter of admiration: admiration, however, is a principal ingredient in the composition of it.

EMULGENT, in *Anatomy*, an epithet bestowed on those arteries which bring the blood to the kidneys, and those veins which carry back what is superfluous to the cava. See *Tub. Anat. (Angul.)* fig. 1. n. 49. fig. 6. lit. 1. 1.

The *emulgent* arteries spring from the descending trunk of the aorta; and the *emulgent* veins terminate in the descending trunk of the cava.

EMULSION, from *emulsi*, to milk, in *Medicine*, a soft liquid remedy, of a colour and consistence resembling milk. It is composed of oleaginous seeds, kernels, or fruits, gum-resins, and gummy or resinous juices, pounded in a mortar, and dissolved in distilled water, or light decoctions, and afterwards expressed, or strained, and sweetened with sugar or syrup.

Emulsions serve to temper, dilute, and soften acrimonies of the breath; to moderate the heat of the kidneys; to soften the sharpness of the urine, and give the patient rest and ease. They serve likewise as vehicles for certain substances which could not otherwise be conveniently taken in a liquid form. The common *emulsion* is made by blanching an ounce of sweet almonds and a dram of bitter almonds, and beating them in a marble mortar; adding gradually the quantity of two pints of water, and straining the liquid. If two ounces and a half of the mucilage of gum arabic are added to the almonds whilst they are pounded in the mortar, we shall have the arabic *emulsion*. These *emulsions* may be used as ordinary drink, in cases which require soft cooling liquors. The camphorated *emulsion* is prepared by grinding half a dram of camphor, and half a dozen sweet almonds together in a stone mortar, and adding by degrees eight ounces of mint water; straining the liquor, and dissolving in it half an ounce of white sugar. A table-spoonful of this *emulsion* may be taken in fevers, and other disorders which require the use of camphor, every two or three hours.

The *emulsion* of gum ammoniac is made by grinding two drams of the gum with eight ounces of water poured gradually upon it till it is dissolved.

This *emulsion* is used for attenuating viscid phlegma, and promoting expectorations. In obstinate coughs, two ounces of the syrup of poppies may be added to it. It may be administered in a dose of two table-spoonfuls, three or four times a day. The oily *emulsion*, prepared by mixing six ounces of soft water with two drams of volatile aromatic spirit, and an ounce of Florence oil, and half an ounce of simple spirit, is serviceable in recent coughs; in more obstinate coughs, it will be better to substitute for the aromatic spirit the pectoral elixir of the Edinburgh Dispensatory. A table-spoonful of it may be taken every two or three hours. Buchan's Dom. Med. p. 716, &c.

ENUNCTORY, from *enunci*, to wipe away, or drain off, in *Anatomy* and *Medicine*, a part of the body destined for the separation of some humour judged useless, or even hurtful to the animal, after its having circulated some time with the blood.

The term *enunctory* also implies a cavity adjoining to the part that separates, wherein the excrementitious humour is collected, and preserved in readiness for evacuation.

The kidneys, urinary bladder; and military glands of the

skin, are *enunctories*; the parotides are not properly *enunctories*, because destined to separate the saliva, which is no useless or excrementitious humour, but necessary for the digestion of the food.

Some, without much propriety, confine *enunctory* to the receptacle into which the secreted excrement is discharged; as the pituitous humour of the brain into the nostrils, the cerumen into the ears, the excrements into the intestines, &c. though these last have not undergone any circulation.

ENEMON, *Enimon*, from *enim*, blood, an external medicine which stops or flanches the blood; or which, by binding, cooling, or drying, closes the passages of the vessels before open, or diminishes the fluidity and motion of the blood. See **STYPTIC**.

ENOREMA, *Enorema*, from *enore*, to swell, expresses such contents of the urine as float about in the middle, resembling a cloud; and thence also called *straculus*. See **URINE**.

ENALLAGE, in *Rhetoric*, a figure whereby we change and invert the order of the terms in a discourse, against the common rule of language.

The word is derived from the Greek, *ἐναλλαγή*, formed of *ἐναλλάξ*, which signifies *change*, as well as the simple verb *ἀλλάσσει*.

The grammarians, too, have a kind of *enallage*, whereby one part of speech, or one accident of a word, is put for another.

Such is the change of a pronoun, as when a possessive is put for a relative, *ex gr. suu* for *tuu*; or of a verb, as when one mood or tense is put for another.

ENALURON, in *Horology*, is used by Guilielmus to express a bordure charged with birds; as an *enallurion* martlets, &c. but Mackenzie charges this as a mistake arising from ignorance of the French tongue; *enallurion* properly signifying *orle*, or in manner of a bordure, and being applicable to a bearing of any thing in that form.

ENAMEL of the teeth. See **TEETH**.

ENAMEL, popularly **AMEL**, a kind of metalline colour, by the Latins called *enamelum*; used in enamelling, and painting in enamel.

Enamels are glasses containing some opake substance, that is either unvitriifiable or incapable of being vitrified with the degree of heat requisite for the fusion of ordinary glass. They are generally composed of glass, mixed with metallic calces.

The common matter, which is the basis of all *enamels*, is thus made: take fine sand, thirty pounds; and the same quantity of fine tin; calcine these together in a kiln, then sift them; boil this powder in water, in clean earthen vessels, and pour off the water, which will carry with it the finer part of the calc; put fresh water on the remainder, boil it again, and pour off in the same manner; do this so long as the water will carry off any part of the calc. Re-calcine the remaining matter, and wash off its finer part in the same manner again, then evaporate all the waters which have washed off the finer calc, and keep the fire low towards the end of the operation, that the calc may not be wasted; this will be found at the bottom, of an extreme fineness.

Take of crystal frit, made with tartar, and of this fine calc, each fifty pounds; white salt of tartar, eight ounces; powder and sift these, and mix them well. Put this mixture into a new earthen-pot, give it a fire for ten hours, then powder it, and keep it in a dry covered place.

This is the common plain *enamel*, of matter of which all the other *enamels* are to be made. In making these, the following general cautions are necessary to be observed. 1. That the pots must be fired with white glass, and must be such as will bear the fire. 2. That the matter of *enamels* must be very nicely mixed with the colour. 3. When the *enamel* is good, and the colour well incorporated, it must be taken from the fire with a pair of tongs. 4. The general way of making the coloured *enamels* is this: powder, sift, and grind all the colours very nicely, and sift mix them well with one another, then with the common matter of *enamels*; then set them in pots in a furnace; and when they are well mixed and incorporated, cast them into water, and when dry, let them in the furnace again to melt; and when melted, take a proof of them. If too deep coloured, add more of the common matter of the *enamel*; and if too pale, add more of the colour.

We may distinguish three kinds of *enamel*; the first intended for the counterfeiting and imitating of precious stones; the second, for painting in enamel; and the third used by the enamellers, jewellers, and goldsmiths, on gold, silver, and other metals; with which last kind, particularly the white, it is that the makers of the Dutch ware give the gloss to their works.

The *enamels* used in imitating precious stones, and those for painting, are usually prepared by the workmen themselves,

feltes, employed in those arts; the rest are brought from Venice and Holland. The composition is the same in the main in all the three kinds; all the difference consists in giving the colour or transparency.

ENAMELS for painting.

ENAMEL, azure blue. To make this, take of the common matter of enamel, four pounds; zaffir prepared, two ounces; brash three calcined, or calcined copper, forty-eight grains: mix all these well together, and melt them in the furnace in the usual way. *Neri's Art of Glass*, p. 150.

ENAMEL, turquoise blue, is prepared by a mixture of six pounds of the basis of enamel, with three ounces of calcined copper, ninety-six grains of zaffir, and forty-eight grains of magnesia.

ENAMEL, black. To make the black enamel, take of the common matter of enamel, four pounds; tartar, four ounces; magnesia, two ounces: grind and mix these powders well with the matter of the enamel, then let them in a furnace in a large pot; when melted and refined, cast them into water; and putting them again into the furnace, let them refine.

Or an excellent black enamel may be prepared by mixing equal quantities of magnesia, saffor, and flakes of iron, and adding one part of this mixture to fifteen parts of the basis of enamel. *Larvis's Com. de Tech.* p. 442.

ENAMEL, the ruby enamel, is made with flakes of vitriol, and fulphure, or with iron rust, well ground on an agate, with oil of spike.

ENAMEL, green. To make this, take of the common matter of enamel, four pounds; melt it, and cast it into water; return it again to the furnace, and when purified, add brash three calcined, or calcined copper, two ounces; crocus martis, made with vinegar, or scales of iron, forty-eight grains. Mix these first in fine powder, and put this in at three several times; when all is well incorporated, take it from the fire.

ENAMEL, milk-white. To make this useful colour in enamel, take of the common matter of enamel, six pounds; magnesia, prepared, forty-eight grains: melt them in the furnace; add the whole into water, and afterwards return it again into the furnace; and when refined, etc. See *DIFFUSION*.

ENAMEL, purple. To make this, take of the common matter of enamel, six pounds; of magnesia three ounces; brash, three calcined, or calcined copper, six ounces; mix all well together, and let them in a furnace, let them refine, then cast them into water; return the matter to the furnace again, and when thoroughly melted, take it out for use.

This mixture, with a small proportion of brash, makes the red enamel.

Permalion red is made with vitriol calcined between two crucibles, luted together; then washed in aqua fortis, and afterwards in fair water; the fire is to be moderate, and to remain about half an hour.

The **lake red** is composed of fine gold, dissolved in aqua regia, with sal ammoniac, or common salt. The dissolution being completed, it is put in a crucible, with spring-water and arsenic, over hot sand for twenty-four hours. Some use a solution of pure black tin, in aqua regia; and others crude tin, to precipitate the gold. The powder remaining at the bottom of the crucible, when the water is poured off, is ground up with double its weight of flowers of sulphur, and put in a crucible over a gentle fire; and when the sulphur which takes fire, is exhausted, the red powder remaining is ground with scabell.

ENAMEL, violet-coloured. The method of making the violet-coloured enamel is this: take of the common matter of enamel, six pounds; of magnesia, prepared, three ounces; of brash calcined, or calcined copper, forty-eight grains: mix the two powders well together; then mix the whole, put them into the furnace, and when refined, cast them into water, return the water again to the furnace, and when refined take it out. *Neri's Art of Glass*, p. 157.

ENAMEL, yellow. To make this, take of the common matter of enamel, six pounds; of tartar, three ounces; of magnesia, seventy-two grains: mix all well together, and put them into the furnace in a large pot; when refined, cast them into water, then return them to the furnace again; and when melted, take it out for use.

Lastly, white copper, calcined, makes a colour much like the amber-colour used by limners. See a Collection of Receipts for making several kinds of enamel of different Colours and Tints in *DuRoi's Handbook to the Arts*, vol. I. l. 6. p. 336 &c. and *Neri's Art of Glass*, with *Mearns's Notes*, and a Commentary by Kiesel, from which most of the above receipts are extracted.

ENAMEL, used by the jewellers, goldsmiths, and enamellers. These, we have observed, come chiefly from Venice and Holland; they are in little thin cakes of diffe-

rent faces, usually four inches in diameter, and half an inch thick. Every cake has the maker's mark struck on it with a punch. The most usual marks are the name Jesus, a lion, monkey, sun, &c.

Those brought from Venice are chiefly white, blue-colour, blue-blur, carthagen, yellow, green, and a deep blue, called a *faux azur*. These seven are the principles of all the others, which arise out of the mixture of these; and the white, in particular, is, as it were, the basis of all the other six principal colours.

White is made, as already observed, of crystal glass, tin, and lead, calcined by a reverberatory fire; and this enamel is used not only by the jewellers and enamellers on metal, but also by the painters in enamel, the makers of Dutch ware, &c. By adding azure thereto, it becomes a blue-colour; by adding copper and Cyprus vitriol, it makes a sky-blue; by perireux, a flesh-colour; and by iron-rust, a yellow; to make a green, they add copper-flint, &c.

ENAMELLING, the art or act of applying enamel of various colours on metals, &c. either in the way of painting, or by the lamp. It has been thought, that this is the same with the enameled painting of the ancients; but modern discoveries have evinced the contrary. See *Encaustic Painting*.

Painting in Encaustic, is a method of painting with enamel, or metallic colours, ground, reduced to powder, and mixed like other colours with a pencil; then luted, taken again, and varnished by force of fire.

The art of painting in enamel, or at least of giving colours to glass, whence this method of painting was derived, is very ancient, and appears to have been first practised on earthen vessels, or potter-ware. As early as in the age of Porcelain, king of Tuscany, we hear of beautiful vases made in his territories, enamelled with various figures, though far short of those afterwards made at Faenza, and Castel Durante, in the duchy of Urbino, in the time of Raphael and Michael Angelo. There are still some of those vases extant in the cabinets of antiquaries; in all which, the design, or drawing of the figures, is much better than the colouring; for they were at that time only acquainted with two colours, viz. black and white, either for earthen or metal works, excepting a faint kind of carnation for the faces and other parts.

In the time of Francis I. of France, the art was retrieved in that country, particularly at Limoges, where there were produced abundance of very valuable pieces, in the manner of the ancients; that it, well performed as to the draught, and the elaboration chiefly in two colours. There are two ways of painting in enamel; the one with clear and transparent, and the other with thick and opaque colours. To use the first, they are only ground up with water; the second are ground up with oil of spike. The first are laid on the metal flat, and bordered, or edged, with a rim of metal, to keep the colours steady; though we have seen pieces laid on contiguous, and without any partition, which is very difficult to practise, because the transparent colours, in melting are apt to run into each other, especially in the smaller works.

The invention of opaque colours is much later, and is greatly preferable to that of transparent ones. All metals, however, will not equally admit of both kinds: copper, for instance, which bears all the opaque colours, will not bear the transparent ones; but to employ these latter upon copper, they are forced first to cover it with a layer or couch of black enamel; over which they lay a silver leaf, and on this apply the other suitable colours; that is, the colours or enamel proper for silver, which itself does not allow of all kinds.

Those which suit it best are purple, green, azure, and aqua-marina; but gold receives all the kinds and colours, both opaque and transparent, perfectly well. It must be added, however, that only the finest gold must be used herein; for the transparent colours being laid on a base gold, grow dim and livid; there being a kind of smoke that settles on it, not unlike black lead.

Of transparent enamel, the hardest are always the best; though there is a difference even among these; some losing their colour in the fire, and others retaining it. As to the reds, they are only red by accident, being yellow when made, and applied on the gold, and becoming red in the furnace. The best transparent reds are those made of calcined copper, iron-rust, orpiment, and calcined gold, melted, with the due proportions of sand and salt of glass.

But it is the method of painting with opaque or thick enamel, particularly those curious ones on gold, representing portraits, to us much perfection as the last painting in oil; and even some military pieces with this great advantage, that their beauty and lustre never decay.

decay, being equally secure from injuries of time and weather.

This art we are indebted for to the French; nothing of the kind having been attempted before the year 1632, when James Toutin, a goldsmith, of Chateaudun, and a great master in the common way of painting with transparent enamel, first applied himself to find a way to use thick colours of different tints, which should melt with fire, and yet retain their lustre, purity, &c.

Toutin succeeded in his attempt: and having got the secret, communicated it to his fellow-artists, who, in their turns, contributed to the bringing of it to perfection: the first who distinguished himself was Dubie, a goldsmith, who wrought in the galleries of the Louvre. After him came Moliere, a native of Orleans, who applied himself chiefly to the painting on rings and watch-cases. His disciple, Robert Vauquer, of Blois, excelled them all, both in his designs and colours. After him, Pierre Chartier of Blois applied himself to the painting of flowers, wherein he succeeded to admiration.

By this time the English were fallen into the way; who, as is allowed by foreigners themselves, seem to have been the first who applied it with success to the painting of portraits.

M. Falbion observes, that the first, and most finished portraits, and those in the finest colours, were brought into France by Purior and Bordin, from England. This occasioned Louis Hance and Louis de Guernier (two good painters in miniature) soon after to attempt the like; in which the latter succeeded beyond every body. He likewise invented several new tints for the carnations, and, had he lived, had probably merited the glory of carrying the art to its last perfection.

This kind of painting, to be in perfection, must be on plates of gold or for copper, before that it emits a fume which tarnishes the colours, is apt to scale and crackle; and silver tarnishes the colours, though it is often performed on plates of copper, enamelled with the white enamel.

These plates are made a little hollow on one side, and raised on the other, either in a circular or oval manner, to prevent the gold's fretting by the fire, and making the colours crack and fly; nor must they be made too thick; it is sufficient they can bear the colours, though it is usual to strengthen them all round with a circle somewhat thicker.

The plate being hammered very evenly throughout, they apply a white enamel on both sides, though the design be only to paint on one of them; the intent of this is to prevent any swelling and warping by the fire: for, otherwise, in large pieces, and especially if the colours be laid on any thing unequally, they are apt to rise up in puffs or blisters. Now, this first lay, which is white, remaining smooth and uniform, serves as a ground for all other colours. The composition of the white enamel, with the other opaque colours, is already delivered under the article ENAMEL.

The gold plate, thus enamelled in white, the draught or design to be painted must be chalked thereon, and afterwards the whole accurately drawn out in a ruddy brown. The draught or out-line thus finished, the piece is set to the fire, and then painted with the colours above prescribed.

The white ground they paint on serves all the colours for white: the method being to spare the ground, from first to last, in the places where the lights are to be, after the same manner as in miniature, though they have another white to lay over the other colours when there is occasion to raise them. Add, that as the painters in oil retouch their painting several times, and let them dry; so in this sort of painting they touch the piece as often as they please, setting it each time to a reverberatory fire, and taking it away again as soon as they perceive that the enamel has got its full polish.

The reverberatory fire is made in a little furnace, wherein there is fire both at-top and all round, on a void place in the middle, where the piece is to be put for the enamel to melt. The colours are laid on with the tip or point of the pencil as in miniature, with this only difference, that they use oil of spike to dilute them instead of gum-water. See MINIATURE.

The workers in enamel must be very cautious of the good or bad qualities of the oil of spike they employ to mix their colours with: it is a thing very subject to adulterations; sometimes with spirit of wine, sometimes with oil of turpentine. In the first case, it wants body, as there is usually too much spirit added; and in the latter, the smook of the turpentine, when heated, spoils the colours. A small mixture of spirit of wine does well; and the best method for the nice artificer, is to refine the oil, and afterwards add to it such a quantity of spirit as is found best.

Vol. II. N^o 113.

ENAMELLING by the lamp, method of. The works of this kind are all performed by the flame of a lamp; wherein, in lieu of oil, is put horse's grease, by some called caballine oil. The lamp is of copper, or whited iron, and consists of two parts, the box and the lamp; in the latter of these, which is a kind of flat oval, is put the oil, and out of these rises the wick: all the use of the box is to receive the oil, which the ebullition occasioned by the intense heat might throw abroad.

This lamp, or even where two or three artists work together, two or three more lamps, are placed on a table of a proper height, &c. under which, about the middle of its height, is a double bellows, like those of an organ, which one of the workmen raises and depresses with his foot to increase and quicken the flame of the lamp, which is by such means excited to a degree of vehemence almost incredible.

The wind of the bellows is conveyed to the several lamps, however many, by means of grooves cut along the thickness of the table, and covered with parchment, extending from the bellows, to a tube or pipe placed before each lamp. These tubes are of glass, and, that the enamellers may not be incommoded with the heat of the lamp, each tube is covered, at about six inches distance, with a piece of tin called a fan, which is fixed in a hole of the table. In works that do not take up much time, they content themselves with a glass blow-pipe to heighten the flame of the lamp.

Applying their cane of enamel to the flame of this lamp, they draw it out into threads inconceivably fine. Those made use of in artificial plumes of feathers are so very slender, that they may be wound on a reel like silk or thread.

The fastidious jets of divers colours, sometimes used in embroideries, are also made of enamel, and that with so much art, that each piece has its hole to pass the silk through wherewith it is sewed. These holes are made by blowing them in long pieces, which are afterwards cut off with a proper tool. See the process of drawing out the enamel, illustrated under DUCTILITY of glass.

It is rare that the Dutch or Venetian enamellers are used pure; the common way is to melt them in an iron ladle, with an equal quantity of glass or crystal; and when the two matters are in perfect fusion, they draw it out into threads of different sizes as occasion requires, by taking a quantity between two pipe-stopples held in the two hands, and removing them asunder as far as the arms will reach. If the thread is to be longer than the workman can stretch, a second person takes one of the ends, and continues to draw it out, while the first continues to keep the enamel to the flame. All the threads drawn after this manner are round; so that the nature of the work require them to be flat; they are afterwards drawn through a pair of pinchers while yet hot. They have another iron instrument, in manner of pincers, to draw out the enamel by the lamp, when it is to be worked or disposed in figures or otherwise. Lastly, they have glass tubes, of various sizes, serving to blow the enamel into various figures, and preserve the necessary vacancies therein, as also to spare the stuff, and form the contours.

When the enameller goes to work, he seats himself before his lamp, with his foot on the treadle, and holding in his left hand the piece of work he is to enamel, of the brass or iron wires his fingers are to be formed with; with his right hand he draws out the thread from the enamel held to the lamp; and this is done with a dexterity and patience equally surprising.

There is nothing but may be thus represented in enamel, and there are figures so finely finished of this kind, that one would take them to have come out of the hands of the ablest sculptors.

ENARGIA, *Enargia*, in Rhetoric, a figure, which passing from the narrative style, points out, and as it were, sets the subject before the eyes of the audience. Voss. Rhet. lib. iii. p. 361.

ENARTHROSIS, *Enarthrosis*, a species of DIARTHROSIS. Such is that of the huckle-bone, &c. See ARTICULATION.

ENCENIA, *Enenia*, a Greek term, signifying *reparation, or renovation*, being compounded of the preposition *en*, and *keno*, *keno*.

ENCENIA, is more particularly used for the name of a feast celebrated by the Jews on the twenty-fifth of the ninth month, in memory of the dedication or rather purification of the temple, by Judas Maccabeus, after its having been polluted and plundered by Antiochus Epiphanes. The Jews had also two other *Encenia*, viz. the dedication of the temple by Solomon, and that by Zerobabel, after the return from the captivity.

ENCENIA is likewise applied in the *Fathers*, and *Church-History*, to the dedication of Christian churches.

St. Augustine assures us, that in his time the use of the word *Encenia* was even transferred to preface matters; and that they called it *Encenia*, when they put on a new suit of clothes.

Our translators of the Bible do not retain the word *Encenia*, in St. John, x. 22. where mention is made thereof, in lieu of that, they call it *Fest of the Dedication*, which is left proper. In effect, it is not the feast of the dedication, but of the purification or re-consecration of the temple polluted, that is there spoken of.

ENCANTMENT, in the *Albion*. See *CANE*.

ENCANTHUS, in *Medicine*, denotes a tumor of the caruncula lachrymalis, in the great carthus, or angle of the eye.

The word is Greek, *ενανθος*, formed of the preposition *en* and *anthos*, *corner of the eye*.

It is opposed to *rhys*, which is a diminution or consumption of the same caruncle. See *RHYAS*.

This tubercle grows either out of the caruncula lachrymalis, or from the adjacent red skin, and is sometimes so large, as not only to obstruct the puncta lachrymalia, but also part of the sight, or pupilla of the eye itself. In this disorder the tears continually run down the cheek, which not only greatly disorder the eye and face, but often give rise to an ophthalmia.

The *encanthus* is of two kinds, the one mild, and without hardness or pain, and the other malignant, livid, and painful; this last tends, in some degree, to a cancerous nature.

In the beginning of the mild *encanthus*, it is best to scarify, and apply a mild caustic; as burnt alum, or vitriol, mixed with sugar. This powder may be sprinkled into the tumor, and carefully washed out of the eye afterwards with warm milk or water; but, if this is not sufficient, it may be carefully touched with the common caustic; and, to give a turn to the humour, internal medicines, as purges, and the like, must be given; and, if it is, or seems, must be made. Heister's Surgery, p. 743.

If these methods take no effect, and the tubercle is of a malignant kind, it is to be drawn out either with a hook, or a pair of pincers, or, if very large, by a threaded needle passed through it, taking hold of both ends of the thread, and gently raising it till it can be cut off; but, in this, great care is to be taken not to wound the lacrymal caruncle. If the tubercle appears livid and cancerous, it is by all means to be let alone, as the irritating of such with medicines is always of very bad consequence.

The *encanthus* is occasioned by a defluxion on that part; or an insect therein, not speedily enough dried.

ENCARDION, from *καρδια*, heart, in *Botany*, a name given by the Greeks to what the Latins properly call the medulla in trees, the heart of the wood, or central hard part of the body.

ENCATHISMUS, from *καταβασαι*, I let in, in the *Medicinal Writings of the Ancients*, a term used to express a sort of bath, in which the patient was only to be plunged up to the belly.

ENCAUMA, from *αμα*, I burn, in *Surgery*, a name given by several writers, to the pustule, or excoriation, owing to a burn. The same word is used also by some as the name of a peculiar kind of ulcer in the eye. Aetius says, that the superficial excoriation of the eye, which are owing to defluxions of humours, are called, by the authors who wrote in early times, by three names, according to their differences. 1. *A caligo*: this is a superficial ulcer, of a bluish colour, formed in the black of the eye, and covering most of it; when the pupil itself is affected by this, the sight is usually much impaired. 2. *The embecula*: this was a smaller, deeper, and whiter ulcer, formed also in the black of the eye. 3. *The episcoria*: this was a roughness of the whole black of the eye, in which it appeared parched, or burnt, and was of a greyish colour over the entire surface. 4. The last of these disorders was the *encauma*: by this name they expressed an ulcer, which produced an impure and solid crust, either in the black or white of the eye, and usually was produced by a fever. And the corruption of the matter of this sort of ulcer was so sharp, that the coats of the eye were not unfrequently eaten through, and the humours fell out. Aetius, Tetrabibl. 2. cap. 3.

ENCAUMA, in the *Old Writers on Medicine*, is also used to express the fever of a fever.

ENCAUSTIC Painting, *εναυστικη*, from *εναυσ*, I burn, is a species of painting with burnt wax, practised by the ancients, and lately revived. Pliny has given the following brief account of the invention and nature of this art: *Cera pingitur ut picturam inverte, qui primus invenit, non encaustic: quidam Arystidis invenit potius, postea consummatione Periclitae: sed aliquando retulit encausticam picturam satore, ut Pliny, et Nicomachus, et Arystidis, Paronem. Lest pingitur, Encauma, pictura seu inscriptio inuenerit: quod profecto non fuisse, nisi encaustica*

inventum. Porphyrus quoque stylistis preceptor non plinij solum encaustica, sed et omni ducit trahit Porphyrius Systema, primam in hoc genere notitiam. Lib. xxxv. cap. 11. From this paragraph we learn, that the method of painting in wax, and burning in the picture, was very ancient; nor is it improbable that in former times, when they were unacquainted with dry oils, and transparent varnishes, they should make use of this method for preserving their colours from damp and heats; though some imagine, that by *cera* is meant a composition, different from wax, and capable of bearing the fire; and that burning the picture denotes merely enamelling. Pliny in the same chapter informs us, that there were anciently two methods of *encaustic* painting in use: *Encausto pingendi duo fuisse antiquis genera censuit, cera & inchole, collato, i. e. virgula, sunt ducit pingit cera. Hoc tertium accipit, resobstantiam cera, pingit inchole, qua pingitur ut nuncius vestis, non fuit, vestitusque carum pingit.* Dr. Parson's maintains, that the *encauma* was a pointed tool used in modelling or carving upon ivory or wax; and he supposes that there is a contrast between the use of the *encauma*, and painting ships with a brush, and therefore that the term *pingendi* cannot be understood to mean the laying on of paint. However, there is a passage in Virgil, lib. vii. cap. 9. which seems to ascertain the nature of the ancient *encaustic* painting. *At qui quid fastidit fuisse, et vixit expulsum minuant suum clarem ritum, &c.* i. e. if any one is more wary, and would have the polishing, or painting, with vermilion hold its colour, when the wall is painted and dry, let him take Carthaginian wax, melted with a little oil, and rub it on the wall with a hair-pencil; and afterwards let him put live coals into a chafin-dish, and hold it close to the wax; when the wall, by being heated begins to sweat, let it be made smooth; afterwards let him rub it with a candle, and clean linen rags, in the same manner as they do the naked marble statues. This the Greeks call *encauma*. The coat of Carthaginian wax is so strong, that it neither suffers the moon by night, nor the sun-beams by day, to efface the colour. From this passage we learn the ancient method of painting in wax by insolation, more obscurely expressed by Pliny; though Pliny, in another passage, expressly informs us, that they use coloured wax: *Cera* (he says) *tinguntur in dimidiis coloribus, quae insolatione*; that they employed a pencil to lay on the melted wax; *refoluitque vixit, pingitque attendit*: that the picture was fixed by insolation, *pingitur inchole*. And we learn from Varro, that the whole was cleaned and polished with linen rags. This ancient art, after having been long lost, was restored by count Caylus, a member of the Academy of Inscriptions in France; and the method of painting in wax was acknowledged to the Academy of Painting and Belles Lettres, in the year 1753; though M. Bachelier, the author of a treatise De l'histoire et du Secret de la Peinture en Cire, had actually painted a picture in wax in 1749, and he was the first who communicated to the public the method of performing the operation of insolation, which is the principal characteristic of the *encaustic* painting. The count kept his method a secret for some time, contenting himself with exhibiting a picture at the Louvre in 1754, representing the head of Minerva, painted in the manner of the ancients, which excited the curiosity of the public, and was very much admired. In the interval of silence, several attempts were made to recover the ancient method of painting. The first scheme adopted was that of melting wax and oil of turpentine together, and using this composition as a vehicle for mixing and laying on the colours. But this method did not explain Pliny's meaning, as the wax is not burnt in this way of managing it. In another attempt, which was much more agreeable to the historian's description of *encaustic* painting, the wax was melted with strong lixivium of salt of tartar, and with this the colours were ground. When the picture was finished, it was gradually presented to the fire, so as to melt the wax; which was thus diffused through all the particles of the colours, so that they were fixed to the ground, and secured from the access of air or moisture. But the method of count Caylus is much more simple: the cloth, or wood, which he designed for the basis of his picture, is waxed over, by only rubbing it simply with a piece of bees-wax; the wood or cloth, stretched on a frame, being held horizontally over, or perpendicularly before a fire, at such a distance, that the wax might gradually melt, whilst it is rubbed on, diffuse itself, penetrate the body, and fill the interstices of the texture of the cloth, when cool, is fit to paint upon: but as water-colours, or those that are mixed up with common water, will not adhere to the wax, the whole picture is to be first rubbed over with Spanish chalk or white, and then the colours are applied to it; when the picture is dry, it is put near the fire, whereby the wax melts, and absorbs all the colours.

M. J. H. Muzis, in a treatise on this subject, has proposed

posed several improvements in the art of *encaustic* painting. When the painting is on cloth, he directs it to be prepared by stretching it on a frame, and rubbing one side several times over with a piece of bees-wax, or virgin's wax, till it is covered with a coat of wax of considerable thickness. In fine linen, this is the only operation necessary previous to painting; but coarse cloth must be rubbed gently on the unwaxed side with a pumice stone, to take off all those knots, which would prevent the free and accurate working of the pencil. Then the subject is to be painted on the unwaxed side with colours prepared, and tempered with water; and when the picture is finished, it must be brought near the fire, that the wax may melt and fix the colours. This method, however, can only be applied to cloth, or paper, through the substance of which the wax may pass; but in wood, stone, metals, or plasters, the former method of count Caylus must be observed.

Mr. Muntz has also discovered a method of forming grounds for painting with crayons, and fixing these, as well as water-colours, employed with the pencil. On the unwaxed side of linen cloth, stretched and waxed as before, lay an even and thick coat of the colour proper for the ground: having prepared this colour, by mixing some proper pigment with an equal quantity of chalk, and tempering them with water. When the colour is dry, bring the picture to the fire that the wax may melt, pass through the cloth, and fix the ground. An additional quantity of wax may be applied to the back of the picture, if that which was first rubbed on should not be sufficient for the body of colour; but as this must be laid on without heat, the wax should be dissolved in oil of turpentine, and applied with a brush, and the canvas again exposed to the fire, that the fresh supply of wax may pass through the cloth, and be absorbed by the colour; and thus a firm and good body will be formed for working on with the crayons. If cloth and paper are joined together, the cloth must be first fixed to the framing frame: and then the paper must be pasted to it with a composition of yolk made with wheaten flour, or starch and water, and about a twelfth part of its weight of common turpentine. The turpentine must be added to the paste when it is almost sufficiently boiled, and the composition well stirred, and left to simmer over the fire for five or six minutes; let wax be dissolved in oil of turpentine to the consistence of a thin paste; and when the cloth and paper are dry, let them be held near a fire; and with a brush lay a coat of the wax and turpentine on both sides the joined cloth and paper, in such a degree of thickness, that both surfaces may shine throughout without any appearance of dull spots. Then expose the cloth to the fire or to the sun; by which means the oil will evaporate, and the wax become solid, and be fit to receive any composition of colour for a ground, which is to be laid on as above directed in the case of cloth without paper.

Almost all the colours that are used in oil-painting may be also applied in the *encaustic* method. Mr. Muntz objects, indeed, to brown, light pink, and unburnt terra di Siena; because these, on account of their gummy or stony texture, will not admit such a cohesion with the wax as will properly fix them; but other colours, which cannot be admitted in oil-paintings, as red-lead, red-ochre, crystals of verdigrise, and red precipitate of mercury, may be used here. The crayons used in *encaustic* painting are the same with those used in the common way of crayon painting, excepting those that in their composition are too tenacious; and the method of using them is the same in both cases.

The *encaustic* painting has many peculiar advantages; though the colours have not the natural varnish or shining which they acquire with oil, they have all the strength of paintings in oil, and all the fineness of water-colours, without partaking of the apparent charact' or defects of either; they may be looked at in any light and in any situation, without any false glare; the colours are firm, and bear washing; and a picture, after having been smoked, and then exposed to the dew, becomes as clean as if it had been but just painted. It may also be retouched at pleasure, without any detriment to the colours; for the new colours will unite with the old ones, without spots, as is the case in common fix painting; nor is it necessary to rub the places to be retouched with oil, as in oil pictures, it is not liable to crack, and easily repaired, if it should chance to suffer any injury. The duration of this painting is also a very material advantage; the colours are not liable to fade and change; no damp can affect them, nor any corrosive substance injure them; nor can the colour fall off in shivers from the canvas. However, notwithstanding all these and other advantages enumerated by the abbé Mazzeas, and Mr. Muntz, this art has not yet been much practised. Many of these properties belong to a much higher species of

encaustic painting lately discovered in England, the colours of which are fixed by a very intense heat; not are the colours, or grounds, on which they are laid, liable to be dissolved or corroded by any chemical menstruum, nor, like the glisty colours of enamel, to run off in the drawing on the fire. See on this subject, Phil. Trans. vol. 31, art. 100. p. 652. art. 101, p. 655. Id. vol. 32, art. 8, p. 40. art. 9, p. 53. Muntz's *Encaustic* Essay of count Caylus, in the Hist. de l'Acad. Roy. des Inscriptions & Belles Lettres, vol. xxxiv. Handmaid to the Arts, &c. vol. 1, ch. ix. p. 255. 261. See VARR.

ENCAUSTICE has been sometimes used to denote the art of ENAMELLING.

ENCAUSUM FURUM, is a name given to powder stucco, to that fine red colour, used for illuminating the capital letters in some old manuscripts. Procopius calls it *hypha*, some have called it *coccus*, and some *cinnabari*. It is said that it was made of the purple colour, extracted from the murex, or purple fish, with some other additions. It is to be observed, that however well this colour, when laid on the parchment, or paper, might resemble the colours of enamel, yet it was improper to call it *encaustum*, which signifies a *stone burnt in*, as in enamelling it would have been to have called it *stramentum*, or ink.

ENCEINTE, Fr. from *enceindre*, to surround, in Fortification, the wall or rampart, which surrounds a place, sometimes composed of battions and curtains either faced or lined with brick, or stone, or only made of earth.

The *enceinte* is sometimes only flanked by round or square towers, which is called a Roman wall.

ENCEPHALITIS, in Medicine, an epithet applied to *worms* generated in the head; where they occasion violent pains, inasmuch as, sometimes, to produce distraction.

The word is compounded of the preposition *en*, in; and *cephalus*, head.

These are four kinds of *encephali*; those properly so called, which are found in the brain; the *menstruati*, in the nose; the *auriculari*, in the ears; and the *dentarii*, in the teeth.

The *encephali*, properly that called, are rare; but there are certain diseases wherein they swarm; and we are told of pestilential fevers, that have arisen wholly from them. In one of these fevers, the physicians, having epistrotic perfum it had carried off, found a little, short, red worm in the head. Herapion, they tried various medicines, to find what might destroy it; but all in vain, till Malmsey wine, wherein horseradish had been boiled, was applied; this was no sooner thrown on the worm, than it died. The same remedy was afterwards tried on the tick, and it recovered them almost all. The tick worms have also been taken out by trepanning, and the patient recovered.

ENCEPHALITES *lapis*, in Natural History, the name given, by authors, to a sort of coarse stone, supposed, in some degree, to resemble the human brain. We have, in the fossil world, many stones, named from the parts of animals, which they have, in reality, been formed from, or owed their original to; and these are properly enough called by names denoting the things whose forms they wear; but it is a very wrong practice, from some slight external resemblances, to give such names to things that never can have been supposed to be so entitled to them. No one can be so absurd as to imagine a human brain can be petrified, though a stone may accidentally somewhat resemble its form. The person possessed of such an accidental specimen, should have ranked it among the stones to which it properly belonged as a stone, whether a flint, a pebble, a nodule, and have named, as an accident only, this form of it; and not have given it a peculiar denomination, as if it were a new species.

ENCEPHALOS, in Physiology, See BRAIN.

ENCEPPE, in Heraldry, denotes chained, or girt round the middle, as is usual with monkeys, &c.

ENCERIS, in Pharmacy, a word used by Galen to signify small concretions of wax, which formed themselves in melted plasters, of which wax was one of the ingredients. As they cooled, the wax cooling first, and collecting itself into little grumes, spoiled the consistence and form of the whole composition.

ENCHANTERS *Nightshade*. See NIGHTSHADE.

ENCHANTMENT, of *ins*, and *cantu*, *I sing*, denotes certain words and ceremonies used by magicians in the practice of their pretended and deluding art; thus called, because the *formulae* of their enchantment were generally composed in verse, and designed to be sung. See CHARM, FASCINATION, MAGIC, SORCERY, and WITCHCRAFT.

ENCHASING, INCHASING, or CHASING, the art of enriching and beautifying gold, silver, and other metal-works, by some design or figures represented thereon, in low relieve. See SCULPTURE, RELIEVO, &c.

Chasing is only practised on hollow, thin works; as watch-cases, cane-heads, tweezer-cases, or the like. 1.

this largest fort was built for Philopater, which required four thousand men.

ENDEIXIS, of *enoxima*, I indicate, in Medicine, an indication of difficulty, whereby is shown what is to be done; as for example, a *pallor*, or pale countenance of blood, indicates the opening of a vein. *Blunness*, in voc. See *DIAGNOSIS*.

ENEMURIS, *Enemur*, in *Antiquis*, an ailment brought against such as affected any piece of land, of which they were incapable by law. *Pott. Archæol. Græc. lib. 1. cap. 23. tom. 1. p. 126.*

ENEMURUS, of *en* and *mur*, *pestis*, that which affects many people together in the same country, as proceeding from some cause peculiar to the country where it reigns. See *DIAGNOSIS*.

ENDEMENTED, DENTED, or INDENTED, in *Etymology*. See *INDENTED*.

ENDEMYCY, is also applied to a fish or pike, and other transverse pieces, when divided alternately have two different colours. *Cope, or entailed with or and azure.*

ENDEPES, from *en* and *pes*, I hit, a word used by Hippocrates to express that part of the foot where the bones of the thumb end, and which is connected by ligaments to the ankle.

ENDEW, in *Etymology*, is said of a hawk that digests her meat so well, that she not only discharges her gorge of it, but even chews her purrlet.

ENDICA, a word used by the physicians for the faces which rubble to the bottom of the vessel in infusions; in some of which they attribute great virtues.

ENDEMENTE, or *Endementis*, in *Chemical Law*. See *INDIMENTE*.

ENDIVE, or *Succowry*, *chicorium*, in *Botany*, a genus of the *geraniaceae* family. Its characters are: the flower has a common feathery empaleum, which is first cylindrical, but it afterwards expanded; the lobes are narrow, spear-shaped, and equal. The flower is composed of many hermaphrodite flowers with one petal, which is tongue-shaped, and cut into five segments. There have also been hairy Italian; the germin is situated under the petal, which afterwards becomes a single seed, enclosed with a down, and shut up in the empaleum. *Linnaeus* enumerates three and *Miller* four species.

The curled *endive* is now much cultivated in the English gardens, being one of the principal ingredients in the salads of autumn and winter; for which purpose it is continued as long as the season will permit. The first time for sowing these seeds is in June; for those which are sown earlier in the year, generally run up to seed before they are arrived to a proper size for blanching. Those plants which were first transplanted will be fit to blanch by the end of August at earliest; and if they are properly managed, in three weeks or a month they will be sufficiently blanched for use; which will be as soon as these salads are commonly required; for during the continuance of good cool lettuce, few persons care for *endive*.

As the quantity of roots required for a middling family is not very great, so there should not be too many plants tied up to blanch at the same time. The manner of tying them is this: first gather all the inner leaves of the plant in regular order into one hand; and then take up all those that are found of the outside ones, pulling off the decayed ones which lie near the ground, observing to place the outside leaves near the middle ones, as near as possible in their natural order, so as not to cross each other. Having thus got the whole plant up in your hand, tie it up with half or twine, at about two inches below the top, very close. About a week after, the plants should be gone once again, to have another tie round the middle, to prevent the heart leaves from bursting out on the sides, which they are liable to do, as the plant grows, if not prevented.

After October, when the nights begin to be frosty, those plants which are far above ground will be liable to be prevented thereby, especially if not covered up on such nights; the best method, therefore, for the late crops, is to take up the plants in a very dry day, and with a large flat pointed dibble plant them into the sides of trenches of earth, which should be laid very upright, sideways towards the sun, with the tops of the plants out of the ground, so that the heavy rains may run off, and be kept dry and secured from frosts. The plants thus treated will be blanching fit for use in about three weeks or a month's time, after which they will not keep good long. The wild *endive*, of which there are some varieties in the colour of the flowers, is seldom propagated in gardens, it growing wild in unimproved lanes and dingle-hills, in diverse parts of England, where the herb-women gather it, and supply the markets for medicinal use. *Miller*.

VOL. II. N. 113.

The common *factory* flands recommended by most of the medical writers, as one of the best known aperients and detergentes; it is prescribed in all affections of the liver, and is a powerful diuretic. *Schroder* tells us, that it has also great virtues attributed to it against hemorrhages; but it is not much regarded at present in either light.

ENDIVIA, *endivia*, the *sea-endive*, in *Botany*, *Hesperis*, the name of a species of sea-plant, described by count Marfigli. There are two species of it, the one having broad and jagged leaves, resembling those of the vine, the other much narrower. This last kind grows on stony, chalky pieces of wood, or any other substance, accidentally found at the bottom of the sea. It seldom grows in very deep water, and thrives best in places where the sea is calm and quiet. It is of a dusky greenish colour, variegated in some places with yellow. It exactly resembles the shape of the *sea-endive* common in our gardens, and its leaves are cut and trimmed in the same manner; but they are of *sea-endive* a substance, that's slight touch defrays them; they are indeed tenderer and more delicate than those of any other known plant, either of the sea or land. When this plant is examined by the microscope, its surface is found to be composed of a great number of capillaries and vessels, or little tubes, between and among them; and when the leaves are cut transversely, there are seen a great number of glandules in them. *Marfigli. Hist. de la Mer. p. 72.* See *COASTALIAS*.

ENDLESS, *endless*, and *endless*, are the substantives.

ENDORSE, in *Etymology*, an ordinary, containing the eighth part of a mile.

This, *Endorse*, is never used but when a pole is between two fish; though others hold, that an *endorse* may be the same between birds, fishes, beasts, &c. *Sir J. Ferrius* adds, that it thence the same coat has been sometimes two coats, and afterwards conjoined within one elevation, for some mystery of art. He bears an *endorse* argent. *Ant. H. Herald. p. 18.*

ENDORSED, *Endorsed*, in *Etymology*, is where things are borne back to back.

ENDORSEMENT, of *en* and *derse*, *hæst*, is particularly used in *Commerce*, for a writing on the back of a bill of exchange by the proprietor or bearer, either thereby to transfer it to some other, or to render it payable to the order of some other, or else to irrevocably an acquittance or receipt. See *EXCHANGE*.

The *endorsement* is only the name of the proprietor, or *endorser*. Note, when the *endorsement* of a bill of exchange is to render it payable to another, it is called an *order*.

To an order it is necessary the *endorsement* be dated, and contain the name of him who paid the value thereof; in which case, the bill belongs to the person with whose name the order is filed, without any other transference, without their condition, the bill is judged to belong to the person who *endorsed* it. The bearer of a bill of exchange protested has a remedy against the *endorser* for the payment of the re-change of the places where the bill was negotiated by their order. In case a bill or note is refused to be paid, &c. the bearer has a remedy against any one of the *endorsers*, where there are several. See *BILL*.

ENDORRING, or *Endorsing*, in *Law*, implies the writing on the backside of a deed, instrument, &c. something relating to the matter contained therein.

ENDOSIS, *Endosis*, of *en* and *osis*, *Enosis*, in the *Medical History of the Arteries*, a word used to express a repletion of any kind, as when a tumor, inflammation, or hardness of any part, becomes less violent, and when the patient becomes calmer, after the exacerbations in fevers of the continual kind, and after fits of the intermittent.

ENDOWMENT, or *Endowment*, the giving or assigning of a dowry to a woman. See *DOWRY*.

The word is also used figuratively, for the giving forth or severing of a sufficient portion for a vicar, towards his perpetual maintenance, when the benefice is appropriated; whence such a vicarage is called a *vicarage endowment*.

ENDYMATHIA, in *Antiquis*, a kind of dance used among the Greeks, performed in Arcadia, to the sound of certain airs composed for the flute.

ENELIASIS, *Eneliasis*, or rather *Enyaliasis*, *Enyaliasis*, in *Antiquis*, a festival in honour of Enyalias, whom some will have to be the same with Mars, others only one of the ministers. *Pott. Archæol. Græc. lib. 1. cap. 20. tom. 1. p. 304.*

ENEMA, of *enema*, I put in, in *Medicine*, denotes a clyster. See *Clyster*.

ENEMY. See *ALIEN*.

ENFUREMA, of *en* and *fure*, is used by ancient medical writers for those parts of the urine which float about in the middle resembling a cloud, foamed, according

4 D cording

roning to Rochester, principally of murine fait.
Comis. Instit. 1. 312.

ENEOUS, of *en* and *neus*, *terry*, a word used by the ancient writers in *Melrose* for a person born deaf, or unable to perform the common offices of life, for want of any of the principal organs.

ENERGETICAL, *laden* or *partisan*, are such as are eminently active, and which produce manifest operations of various natures, according to the various circumstances and motions of such bodies or parties.

ENERGIC, an appellation given to certain disciples of Colinus and Melancthon, of the sixteenth century, because they held the Eucharist was the energy and virtue of Jesus Christ; not his real body, nor a representation thereof.

ENERGUMENUS, *Enyngumen*, a term sometimes used by divines and schoolmen, to signify a person yielded with a Devil, or an evil spirit.

The word is formed from the Greek, *energetes*, to be excited, worked, of *en*, and *ergon*, action.

Though Pagan fays, the *Enyngumen* were such as counterfeited the actions of the devil, performing things which seemed supernatural. The council of Orange declares, or despite the *Enyngumen* of the functions of the priesthood. See *DEMONIAC*.

ENERGY, an uncommon force or strength in a discourse, a sentence, or a word. See *ENTHUSIASM*.

The word is Greek, *enargia*, formed of the preposition *en* and *argos*, work, labour.

ENERVATING, the act of destroying the force, use, or office, of the nerves, either by cutting them, by weakening them with delirium, or by some other violence.

Excess of wine, and other strong, hot, spirituous liquors, enervate or weaken the nerves. When they would render a horse useless, they enervate him, or cut his nerves.

EVERYTHING, is particularly used in the *Almagest*, for the cutting two tendons on the side of a horse's head, under the eyes, which meet on the tip of the snout; they thus remove his eyes, and make their heads small and lean.

The word is also used figuratively. It is no small artifice in dissipation, to be able to enervate and extenuate the allegations of one's antagonist. This author has a weak, enervate style. See *NEAR*.

ENERVATION, a term in the *described anatomy*, applied to the tendons of the recti, or straight muscles of the abdomen.

The fibres of the recti of the abdomen do not go from one extremity of the muscles to the other, but are intersected by several nervous places, called by the ancient *nerveless*, though they be real tendons.

Their number is not alike in all, some having three, others four, &c.

ENFANS PERDU, a French phrase, used in *M's*, to signify the soldiers who march at the head of a body of forces appointed to sustain them, in order to begin an attack, make an assault, or force a post.

The word literally imports *lost children*, on account of the imminent danger they are exposed to.

In English, they are called the *forlows*, or *forlorn hope*.

At present, the grenadiers usually begin such attacks.

ENFILADE, a French term, sometimes used in English, signifying a successive continuation of several things, disposed, as it were, in the same thread or line; as an *enfilade* of rooms, of doors, of buildings, &c.

The word is formed of the French verb, *enfiler*, to string a thing, which is compounded of *en*, in, and *fil*, of a line, thread; q. d. a thread or string of any thing.

ENFILADE, in *M's*, is applied to those *enfilades*, and other lines, which are ranged in a right line, and so may be scored or swept by the cannon lengthways, or in the direction of the line, and rendered almost defenceless. Care must be taken that the lines be not *enfiladed*, or *enfiladed*; on the contrary, the covert line must be *enfiladed*, that the enemy may be driven out of it. The last boyan, or gut of the trenches, is subject to be *enfiladed*, that is, to be scored according to its length.

A *battery d'enfilade*, is that where the cannon sweep a right line.

A *post*, or command *d'enfilade*, is a height from which one may sweep a whole line at once.

ENFRANCHISEMENT, the incorporating any man into a society or body politic. See *FREEDOM* and *FRANCHISE*. Thus, he that by charter is made denizen of England, is said to be *enfranchised*. The like is understood of a person made a citizen of London, or other city or corporate town; because he is thereby made partaker of the liberties appertaining to the corporation whereof he is *enfranchised*.

ENGAGEMENT, in a *Naval Sense*, denotes a particular or general battle at sea, or an action of hostility between single ships, or detachments, or squadrons of men of war; the whole economy of which may be arranged under the heads of preparation, action, and repair. The

preparation is begun by issuing the order to clear the ship for action, which is repeated by the boatswain and his mates at all the hatchways. The hammocks are first removed; every sailor stowing his own bedding properly and firmly cording it with a lashing, or line provided for that purpose; at each side of the quarter-deck and poop is furnished with a double net-work, supported by iron cross fixed immediately above the gunnel or top of the ship's side; the hammocks thus corded, are firmly hoisted by the quarter-master between the two parts of the netting, so as to form an excellent barrier or sort of passer, to prevent the execution of small flut on the quarter-deck: the tops, wailes, and fore-cleats, are secured in the same manner. At the same time the boatswain and his mates are employed in securing the fall-yards, so prevent them from tumbling down when the ship is cannonaded, whereby it might be disabled. The yards are secured by strong chains or ropes, besides those by which they are usually suspended. The boatswain also provides the necessary materials for repairing the rigging; and the carpenter and his crew prepare shot pions and mauls to close up any breach that may be made near the surface of the water, and provide the iron-works necessary to resist the chain-pumps. The gunner with his mates and quarter-gunners, examine the cannon of the different batteries, and provide proper charges, &c. The master and his mates attend to the number and trimming of the sails, &c. The lieutenants visit the different decks, taking care that all incumbrances are removed, and giving instructions to the other officers, that every thing may be ready for the expected engagement at a moment's warning. When the hostile ships have approached each other to a competent distance, the drums beat to arms: the boatswain and his mates pipe all hands to quarters at every hatch-way. The persons appointed to man the great guns immediately repair to their respective stations; crews, hands-pikes, ratlines, sponges, powder-horns, matches, and train-pikes are placed in order by the side of every cannon. The hatchways are laid to prevent any one from escaping into the lower apartments. The masts are drawn up in rank and file, on the quarter-deck, poop, and fore-cleat. The ladders of the great guns are let loose, and the companies withdrawn: the whole artillery, above and below, is run out at the ports, and levelled to the point-blank range ready for firing. When the necessary preparations are finished: the commencement of the action is determined by the mutual distance and situation of the adverse ships, or by the signal from the commander in chief of the fleet or squadron. The cannon being levelled in parallel rows, projecting from the ships' side, the most natural order of battle is evidently to range the ships adroit of each other, especially in the *enfilade* in general. The most convenient distance is probably within the point-blank range of a musket, so that all the artillery may do effectual execution. The combat usually begins by a vigorous cannonade, accompanied with the inter-arms of all the swivel guns and small arms. Instead of firing platoons, or volleys of cannon at once, the general rule on these occasions throughout the ship is to load, fire, and sponge the guns with all possible expedition, yet without confusion or precipitation. The captain of each gun is enjoined to fire only when the piece is properly directed to its object. The lieutenants who command the different batteries traverse the deck, to see that the battle is prosecuted with vigour, and to animate the men in their duty. The midshipmen second their instructions, and give assistance where it is required at the guns committed to their charge. The gunner takes care that the artillery is supplied with powder, and that the cartridges are conveyed along the decks in covered boxes. The ship that is defeated acknowledges the victory by striking the colours, and is immediately taken possession of by the conqueror, who treats her officers and crew as prisoners in his own ship, and invests two principal officers with the command of the prize till a captain is appointed by the commander in chief. When the engagement is concluded, they begin the repair. The cannon are secured by their breechings and tackle; the sails that have been rendered unserviceable, are mended; and the wounded masts and yards struck upon the deck, and lifted or replaced by others. The running rigging is knotted, and the running rigging lifted whenever it is necessary. Proper sails are bent in the room of those that are become distaff. The carpenter and his crew repair breaches in the ship's hull by stoppings, pieces of plank, and thrust-lead. The gunner and his assistants replenish the allotted number of charged cartridges, and rest the damaged furniture of the cannon.

When two fleets or squadrons are preparing for engagement, it will be the endeavour of the admiral or commander in chief to come to action as soon as possible. To facilitate the execution of the admiral's orders, the

whole fleet is ranged into three squadrons; each of which is classed into three divisions, under the command of different officers. Before the action begins, the adverse fleets are commonly drawn up in two lines parallel to each other, and close-hauled. When the admiral displays the signal for the line of battle, the several divisions separate from the colours in which they were disposed according to the usual order of sailing, and every ship crowds into its station in the wake of the next ahead, at the distance generally of about fifty fathom; which distance is regularly observed from the van to the rear: though the admiral may sometimes find it necessary to contract or extend his line, according to the length of that of his adversary; always taking care that his own line be secured from being doubled, which might throw his van and rear into confusion. When the adverse fleets approach each other, the courses are commonly hauled up in the breeze, and the top-gallant sails and stay-sails furled: the frigates, tenders, and fire-ships, being hauled upon the wind, lie at some distance behind the line of battle; and transports and store-ships lie beyond them, at a still greater distance from the scene of action; and if the number of ships allows it, a body of reserve from the different squadrons is selected to cover the fire-ships, &c. and stationed opposite to the weakest parts of the line, so that they may readily fall into the line in case of necessity. Each ship forming the line should keep close to its station during the engagement; the assault of boarding being seldom permitted unless in single action. Because the regularity of a close line constitutes the principal force of the fleet, and the skill of the admiral is greatly concerned in keeping his line, notwithstanding unequal attacks and damage, as complete as possible. If he proves victorious, he should prosecute his victory as much as possible, by seizing, burning, or destroying the enemies ships. If he is defeated and reduced to the necessity of retreating, he may judge it expedient, for greater security, to range his fleet into the form of a half-moon, placing himself in the centre. The enemy's ships that attempt to fall upon his rear will thus be exposed to the fire of the admiral and his second, and the escape of his own ships will be facilitated whilst the pursuit of his adversary is retarded. Upon the whole, the real force or superiority of a fleet consists less in the number of vessels and the vivacity of the action, than in good order, dexterity in working the ships, presence of mind and skillful conduct in the admiral and captains. Falconer's Marine Dict. Art. ENGAGEMENT. See BATTLE, LINE of battle, and SIGNAL.

ENGAGEMENT, in *English History*, was the obligation imposed by Oliver Cromwell required to be signed by every member of the First Parliament in 1654, submitted by his authority, after he was declared Protector, viz. I, A. B. do hereby freely promise and engage myself to be true and faithful to the Lord Protector, and to the commonwealth of England, Scotland, and Ireland, and shall not (according to the tenure of the indenture whereby I am returned to serve in this present parliament) propose or give any consent to alter the government, as it is settled in one Engage-ment and a parliament. Many who refused to sign this engagement, were excluded from the house.

ENGAMOS, in *Natural History*, the name given by the people of some parts of Guinea to a root very common there, and much resembling our larger sort of turneps, but not so sweet or juicy. They commonly boil these with their potatoes, in the same kettle with their meat. The latter of these roots, which is considerably different from our potatoes, gives a fine flavour to the whole, and makes the broth and meat taste as if salt-water were added to it. The *engamos* also partakes of the flavour, and in this case becomes very agreeable. Phil. Trans. N° 108.

ENGASTRIMANTES, *Engastrimantes*, in *Antiquity*, called also *ENGASTRIMYTHI*, *Engastrimythi*, a designation given to such dignitaries as were polluted with debauch, which either lodged or spoke within their bodies. Pott. Archæol. Græc. lib. ii. cap. 12. tom. I. p. 301.

ENGASTRIMYTHUS, *Engastrimythos*, or *ENGASTRIMANDER*, a person who speaks from, or with the belly, without opening his mouth; or, if open, without stirring the lips. Thus called by the Greeks, from *en*, *within*, *belly*, and *mythos*, *speech*; and by the Latins, *ventrilquistus*, *quæstio ventris signum*.

The ancient philosophers, &c. are divided on the subject of the *engastrimythi*. Hippocrates mentions it as a disease. Others will have it a kind of distention, and ascribe the origin and first discipline thereof to one Eurychus, whom nobody knows any thing of. Others attribute it to the operation or possession of an evil spirit; and others, to sit and mechanism.

The most eminent *engastrimythi* were the Pythians or priestesses of Apollo, who delivered oracles from within, without any shew of the mouth or lips.

St. Chrysostom and Oecumenius make express mention of a sort of divine men, called by the Greeks *engastrimandri*, whose prophetic bellies pronounced oracles.

M. Schottus, library-keeper to the king of Prussia, in a Dissertation on the Apostrophs of Homer, maintained that the *engastrimythi* of the ancients were only poets, who, when the priests could not speak in verse, supplied the defect, by explaining or delivering in verse what Apollo dictated in the cavity of the belly, placed on the fixed tripod.

Leo Allatius has an express treatise on the *engastrimythi*. See VENTRILOQUIST.

ENGENDERING, or **INGENDERING**, the act of begetting or producing the kind, by way of generation.

The term is likewise applied to other productions of nature: thus, meteors are said to be *engendered* in the middle region of the air. Crude trusts *engender* worms. The ancients believed, that insects were *engendered* of putrefaction.

ENGINE, in *Mechanics*, a compound machine, consisting of several simple ones, as wheels, levers, screws, or the like, combined together, in order to lift, call, or sustain a weight, or produce some other considerable effect, so as to save either time or force.

The word is formed of the French, *engine*; or of the Latin, *ingenium*, *not*; because of the ingenuity required in the contrivance of *engines*, to augment the effect of moving powers.

The kinds of *engines* are infinite; some for war, as the BALLISTA, CATAPULTA, SCORPIO, ARBES, &c. others for the use of peace, as MILLS, CRANES, PRESSES, CLOCKS, WATCHES; *engines* to drive piles, to raise water, WHEEL and WATTS-PRESS; to extinguish fire, see FIRE-ENGINE, &c. See HYDROCASTERIUM. See STREAM-ENGINE, &c. See also INSTRUMENT.

ENGINEER, or **INGENIER**, in its general sense, is applied to a contriver or maker of any kind of useful engines or machines.

In its more proper sense, it denotes an officer in an army or fortified place, whose business is to contrive and inspect attacks, defences, works, &c.

An *engineer* should be an able and expert mathematician, particularly versed in military architecture and gunnery; being often sent to view and examine the places intended to be attacked: to choose out, and shew the general of the weakest place; to draw the trenches, assign the places of aim, galleries, lodgments on the counter-scarp and half-moons; conduct the works, pits, mines, &c. and appoint the workmen in their right task; he is also to make the lines of contravallation; with the redoubts, &c.

Under the establishment of the office of his majesty's engineers, the corps of *engineers* consists of one colonel in chief, two directors or lieutenant-colonels, four sub-directors or majors, twelve *engineers* in ordinary or captains, twelve *engineers* extraordinary or captains, fourteen sub-*engineers* or lieutenants, twenty-four practitioners, *engineers* or second-lieutenants, and about a few *engineers* in the Irish establishment. See GUNNARSKA.

ENGISOMAS, *Engisomas*, from *eng*, *from*, and *isoma*, a species of fracture of the skull, wherein one of the extremities of the fractured bone is thrust inward upon the dura mater, and the other extremely raised outward. See TRAPPANING.

ENGLECEBIE, **ENGLECEBIE**, or **ENGLECEBIE**, a term of great import among our ancestors, though now obsolescent properly signifying the quality of an Englishman.

If a man were privately slain, or murdered, he was anciently accounted *FRANKLINCEN* (which comprehended every alien, especially the Danes), till *englecebie* was proved, i. e. till it was made to appear that he was an Englishman. Brahm, lib. iii.

The origin of the custom anciently subsisting among the Goths in Sweden and Denmark, was thus: King Canutus, having conquered England, at the request of his nobles, sent back his army into Denmark, only retaining a guard of Danes for his person; and made a law, that if any Englishman killed a Dane, he should be tried for the murder, or, if he escaped, the village where the man was slain should be charged to pay sixty-six marks into the exchequer. After this law, which was confirmed by William the Conqueror, for the sake security to his own Normans, whenever a murder was committed, it was necessary to prove the party slain an Englishman, that the penalty of sixty-six marks might not be charged on the village. This practice was abolished by statute 14 Edw. III. cap. 4.

ENGLISH, in a general sense, something that relates to the country or people of England.

We say, the *English crown*, *English copper*, *English money*, *English measure*, *English weight*, &c.

The speaking French is called by foreigners, *françois*, *françoise*, the *French*, &c. Du Cange calls the *Norman French* *Norman*. See NORMAN-FRENCH.

ENGLISH DRUG, *Anglicanum*. See DRUG.

ENGLISH, or the *English Tongue*, the language spoken by the people of England; and with some variation, by those of Scotland, as well as part of Ireland, and the rest of the British dominions.

The *English* is of Gothic, or Teutonic extraction; this was the root on which several other dialects have been since grafted, particularly the Latin and French. See PROVERB, &c.

The language anciently spoken in our island was the British, or *Welsh*, which was common to the Britons and Gauls; and which still subsists, in more or less purity, in the principalities of Wales, the Islands, and Highlands of Scotland, part of Ireland, and the northernmost of France, particularly Bretagne, and very lately subsisted in the country of Cornwall. See CORNWALLIAN. According to which, the ancient language of this island was the Celtic, or *Gaulish*, of which the Irish, Welsh, and Breton are so many than distinct dialects. Bled's Lect. on Rhet. vol. i. p. 170.

As the Romans, entering *Wales* towards the western parts of Europe, under Julius Cæsar, Claudius, and Domitian, came to take in Gaul and Britain, the Roman tongue became propagated thenceforth all the cities, yet relating to the public affairs, being distinguished from that language.

The Latin, however, it is certain, never got to much ground, or prevailed to far in England, as in Lombardy, Spain, &c. the Gauls partly on account of its great distance from Rome; and the small resort of Roman bishops; and partly, because the entire reduction of the kingdom was not effected till late as the reign of Claudius, when the empire was on the declining hand, and the new province was forced to be soon deserted by its conquerors, called to defend their territories nearer home.

Britain, thus left naked, became an easy prey to the Angles, or Anglo-Saxons, a roving nation, from Jutland and Norway, who took an early possession thereof about the year 450, much about the time that the Franks, another German nation, entered Gaul. The Gauls and Franks, it seems, at length came to terms; and found means to unite into one nation; and thus, the ancient Gaulish, with its mixture of Latin, continued the prevailing tongue, only further intermixed with the *Franks* or *lingua France* of their new invaders; but the Britons were more constant, and determined absolutely to refuse any such coalition: they had embraced Christianity, Augustine being sent from Rome to convert them about the year 595, and their conquerors were impatient rather than admit of such an union, therefore they chose to be shut up, with their language, in the mountainous parts of Cambria or Wales.

The *English* Saxons, thus left absolute lords, changed every thing; their own language was now fully established; and the very name of the country was henceforth to be Anglo-Saxon. The new language remained in good measure pure and unmixed, till the Norman invasion, the architects of the Domes, and the neighbouring of the Britons, indeed, wrought some later innovations therein; but, in the main, it preserved itself; for, as to the Danes, their language was not much different from the other. Edward the Confessor, however, who had lived long in France, might possibly bring in a little mixture of the dialect of that country.

But William I. and his Normans, having got possession of England, an alteration was soon attempted; the conquest was not complete, unless the Conqueror's language, the French or Franco-Gallic were introduced; and accordingly, all his acts, diplomas, edicts, pleadings, and other judicial matters, were written, &c. in that tongue.

But his attempts proved unsuccessful; the number of Normans he brought over being very small in comparison of the *English*, with whom they were incorporated, they lost or forgot their own language, sooner than they could make any change in the *English*. This, however, did not hinder, but, by the endeavours of the Conqueror, abundance of French words, though many of them of Latin original, crept into the *English*; and many *English* words, by degrees, grew out of use.

Hence, as to the origin and etymology of many of our words, Dr. Wallis lays it down, that such words of German original as we have in common with the French, are to be reckoned as our own, rather than as words borrowed from them; and that the old Gaulish

words, common to the French, and the Welsh, which are found in our language, have been likewise taken from the Welsh, rather than from the French. Hence, also, the same author accounts why the names of the different sorts of cattle are Saxon; as ox, cow, calf, sheep, hog, goat, deer, &c. and yet that their flesh when prepared for food, is French; as beef, veal, mutton, pork, bacon, venison, &c. the Norman nobles, not contenting themselves with pastures, parks, and the like places, where both creatures are fed and kept, so much as with markets, tilth, and entertainments, where the food was either prepared, sold, or eaten.

Under Henry II. Dr. Swift observes, the French made a still greater progress, because of the large territories possessed on that confederate, both from his father and his wife, which accelerated frequent marriages, and, with numerous retinues, &c. And for some centuries after, there was a constant intercourse between France, and England; by the dominions we possessed there, and the conquest we made, so that the language, ten or three hundred years ago, seems to have had much more French than it present.

Before this alteration from the conquerors, the language in process of time had went several alterations, as length came to have numerous words and phrases of Saxon dialects imported into it, in lieu of the ancient Saxon; particularly, by means of negotiations and commerce with other nations; by the marriages of royal families; by the infiltration of many writers, in most ages, who are fond of coining new words, and altering the simple forms of speech, for the greater dexterity; and, by the necessity of framing or borrowing new words, according as new things and inventions turn up; and by such means was the old Anglo-Saxon converted into the present *English* tongue.

Having traced the rise and progress of our language historically, we think it may be no inconsiderable amusement to represent by actual examples the several successive changes and stages it has passed through, to arrive at its present perfection; in order to which, we shall make use of the collections of the ingenious Mr. Greenwood.

From the Saxon invasion, we have no memorial extant of the language for 250 years; the oldest Saxon writing in being is a gloss on the Evangelists, written in the year 700, by Eusebius, bishop of Holy Island; in which the three first articles of the Lord's Prayer run thus:

"Uren Fader this arth in heofon, so gehroled
"this nama, so cymeth thin etc. Siethin willa
"Iuc is heofon, and in earth." &c.

Two hundred years after, in the year 900, the same was rendered thus:

"Thu ure Fader this art on heofenum, si thin
"nama gehroled; cume thin rice. Siethin willa on
"eorthan (wa, swa on heofenum."

In the following age it was turned thus in the Saxon Homilies, said to be translated by King Alfred:

"Fader ure thu the eath on heofenum, si thin
"nama gehroled, to be cume thin rice, geweorthe
"thin willa on eorthan (wa, swa on heofenum)." &c.

About the year 1160, under Henry II. near which period the Saxon began to assume a form to which the beginning of the present *English* may be discovered; it was thus rendered by pope Adrian, an Englishman, in rhyme:

"Ore Fader in heuven rich,
"Thy name be haryed ever last,
"Then bring us thy nichell pelfe:
"As hit be in heuven y-doe
"Eue in earth be it alia." &c.

About two years after, in the time of Henry III. it was translated thus:

"Fadir that art in heuven bliss,
"Thou kepe nam towarth the bliss,
"Cume & met thy kingdom,
"Thou hely will be it all oon,
"To heuven and in erth abow." &c.

Two hundred years after, under Henry VI. it was rendered thus:

"Ore Fadir that sit in heuven, hallowe hand
"name, thy kingdom come to thee, be all will
"do in earth, as in heuven." &c.

Dr. Halker finds an extraordinary specimen of the *English* as spoken in the year 1385, in his *Triclinus*, *Inter*. Several, which we shall rather spare the reader with, as it is on this very subject, the *English* never, and contains not only the letters, but the nature of the changes and differences thereof.

As to the how many manner people speak in this land, there be both also in many dyvers languages and tongues. Now, I say, Wille the men and Stow that both now, as modified with other nations, holdeth welwyn his first language and speech: but sir the Scotis that were sometimes confederal and swayed with the Pictis

"drawe somewhat after his speche; but the Fleminges
 "that woneth in the welle lide of Wales, haveth left
 "her strange spech, and spekeeth Sexonliche now. Also
 "Englishe men, they had from the bygynnyng thre
 "maner speche: northerne, southerne, and middell
 "speche in the middell of the londre, as they come of
 "three maner of peppe of Germania: notheleth by
 "commynxion and myddelinge first with Danes, and
 "afterwards with Normans, in many the contrary lon-
 "ge is payred [corrupted]. This appayryng of the
 "burthe of the tynge is by cause of twise thynges, oon
 "is for children in lede agens the usage and maner of
 "all other nations, beeth compelled for to leve hire
 "own langage, and for to confitue hir lessons and here
 "thynges in French, and so they haveth sette Normans
 "come first into Engeland. Also gentlemen children
 "beeth taught to speke French in the tyme that
 "they beeth rokked in here cradell, and kenneth speke
 "and play with a childer frooke; and uplandishe men
 "will lene thyngs to gentillmen, and fundath work
 "great beyefurth to speake French, to be told of
 "hit cometh a grete wonder how Englishe men and
 "her own langage and tynge, is so dyvers of fowm
 "in this oon lond: and the langage of Normandie is
 "comynge of another lond, and hath oon maner fowm
 "amonge alle men that spekeht hit ager in Engeland.
 "Also of the forsaide Saxon tynge that is delid [divided]
 "a thre, and is abidde farceliche with few uplandishe
 "men, is greet wonder. For men of the est, with
 "men of the west, is, as it were, under the same pat-
 "tie of hevenc accordeth more in fawnyng of speche,
 "than men of the north, with men of the south.
 "Therefore it is that Mercil, that beeth men of myddel
 "Engeland, as it were parteners of the endes, under-
 "stondeh better the fide langages northerne and south-
 "erne, than northerne or southerne understondeh
 "either other. All the langage of the Northumbers,
 "and specialliche at York, is so icharp, listyng and
 "fynnyng, and unshape, that we feutheine men may
 "that lorgyng unneche understondeh. I trow that
 "is by cause that they beeth vyth to strange men and
 "nations, that spekeht strongliche, and also by cause
 "that the kynges of Engeland wonneht alwey fer from
 "that cuntry. &c.

The first of our authors who can properly be said to have written English, was Sir John Gower, who, in his Confession of a Lover, calls Caucer his disciple. How the English flourished about the year 1260, may be seen in Chaucer, who refined and improved it very considerably; though he is charged with the affectation of mixing too many French and Latin words with his English, and by that means, with too much altering and corrupting the primitive language.

In the year 1537, the Lord's Prayer was printed according to the following version:

"O our Father, which arte in heven, hallowed be
 "thy name: let thy kingdom come, thy will be
 "fulfilled as well in erth as it is in heven," &c.

Where the reader will observe the diction almost brought to the present standard; the variations being principally in the orthography. See an historical view of the progress of the English language, with specimens at different periods, from the age of Alfred to that of Elizabeth, in the Introduction to Dr. Johnson's English Dictionary, vol. i. fol.

Spencer, who lived in the same age, contributed not a little to the improvement and refining of the tongue: he threw aside abundance of the outlandish ornaments, and wrote a purer English, yet with more elegance and variety than had been known before. He was succeeded by Shakespeare, Ben Jonson, Lord Bacon, Milton, Cowley, Waller, Tillotson, Dryden, Addison, and Pope, the whole works are in every body's hands; and by whom the language has been transmitted to us under all its present advantages.

The professions ascribed to the English, and that in a degree superior to any of the modern tongues, are, 1. That it is very strong and significant; to which our finely compounded words formed on the model of the Greeks, do not a little contribute.

2. Copious; of which Mr. Greenwood gives us instances in the word striking; which we have above thirty different synonymous expressions for; as to smite, bang, beat, buff, buffet, cuff, hit, thump, thrash, flap, rap, tap, kick, spurn, lance, strike, pummel, punch, &c. and the word anger, for which he enumerates above forty. So we say to eat or to eat belly, grow prunes, putte eggs, coddle apples, bake bread; for which expressions, is justly, stew, pickle, cullid, and bake, the Latin, with all the boasted copia of the tongue, have only one word, *coquere*; and the French, as much as they abound with terms of cookery, not many more; the word *cuisse* serving indifferently for *stewing, boiling, basting, stewing, and cooking*.

Vol. II. N^o 114.

3. Musical and harmonious; in which respect Mr. Dennis makes no scruple to assert it superior even to the French. This, which some may think strange, he proves hence, that we have blank verse which is harmonious by mere force of numbers and quantity; whereas the French have long ago desisted from all pretensions to poetical numbers, without the assistance of rhyme.

It may be added on this last head, from Mr. Wellhead, that the English has many measures, the iambic and trocheic, for instance, in common with the Greek and Latin; an advantage arising from the variation of the accent; and that rhyme is peculiarly natural to it, varying itself to the ear with excessive sweetness; not to mention the caesuras, pauses, transpositions, and numberless other graces, which the English versification is capable of, probably beyond every other living language.

Some object to the English that it consists too much of monosyllables; which others make a piece of merit, as it argues the greater simplicity. If what Salmasius says be true; *Certum est quod, lingua nostra, nec monosyllabum, catenat, catenat off antiquitatem*, he adds, that the ancient Greek abounded with *barbarism*, as appears from the ancient poets, and such as assisted antiquity. De Re Hellenica.

But we have a further advantage from our monosyllables, viz. *certifecity*, as we are hereby enabled to express more matter in the same compass of letters than any other modern tongue. The only thing we suffer by it, is, something in point of softness and numbers; and yet we have verses composed wholly of monosyllables, that do not want harmony; as that of Creech,

"Nor could the world have borne to see a flame,"
 Others object to our language, that it does not equal the softness, the delicacy, of the more southern languages, of France, Spain, and Italy. It seems to retain somewhat of the Gothic roughness of the people who framed and introduced it; the soil and climate it was planted in, not tending much to mellow and refine it.

To this purpose does Dr. Swift speak, who accounts for the effect hence, that the Latin tongue was never in its purity in our island; and besides, even removed, in its imperfect state, before it could have time to incorporate with the language of the country, and fobber and soften it, as it did in the other provinces of France and Spain, &c. But it is to be observed, that upon the whole, this, supposing it true, does not lie as an objection against the language; but the people: our manners are also less polished than some of our neighbours; we are not yet arrived at that pitch of modesty, of delicacy, of tenderness, which we confound in them; and it is but just our language correspond with the rest of our character.

Mr. Wellhead is of opinion, that the English language is not capable of a much greater perfection than it has already attained. We have trafficked, he observes, with every country for the enriching it; the ancients and moderns have both contributed to the giving it splendour and magnificence; the fairest cyons that could be had from the gardens of France and Italy, have been grafted on our old stocks, to refine the favours of the breed; we have laid aside most of our harsh, unpolished words, and retained few but those of good and sound energy; the most beautiful polish is at length given our tongue that it will bear, without destroying and altering the very basis and ground work of it; its rustic taint is worn away, and little or nothing is wanting either of copiousness or harmony. He goes on to argue the maturity and perfection of the English, from another very extrinsic principle, viz. by comparing the time and circumstances of the improvements made hence the first refinements of it with those of the Greek, Latin, French, and other tongues that confessedly have arisen to their height.

Every civilized nation, that author thinks, has its classical age; and he suggests, that the English are not far from it. So that what remains to be done for the English tongue, should not be to advance, but to fix it where it is, and prevent its declining. There is, in effect, a point of perfection, which when a language has once arrived at, it cannot exceed, though it may degenerate from it; and thus it happened to the two finest languages that the world has known.

It may seem odd to talk of fixing so unstable a thing as language: the Greek liturgies of St. Basil, and St. Chrysostom, still used in that church, the one for solemn, the other for common days, have been a long time unintelligible to the people; so much is the Vulgar Greek degenerated from its original purity! Polybius testifies, that the articles of truce between the Romans and Carthaginians could scarce be understood by the most learned Roman antiquaries, three hundred and fifty years after the time in which they were made. In effect, from the days of Romulus, to those of Julius Caesar, the Latin was perpetually changing; and what was written three hundred years before Tully, was as unintelligible in his time as the

the English and French of the same period are now; and these two have changed as much since William the Conqueror, in about seven hundred years, as the Latin appears to have done in a like time.

Whether our language will decline as fast as the Roman did, may admit of some doubt; there being many circumstances in the affairs of that nation, which contributed to that speedy corruption, that may not, in all probability, find place among us. The French, for about a century past, has been polishing as much as it will bear; and it appears to be now declining, by the natural inconstancy of that people, and the affectation of some late authors, to introduce cant words, which is the most ruinous corruption in any language. But without some such consideration, there does not seem any absolute necessity, why a language should be perpetually changing.

We find examples to the contrary; from Homer to Plutarch, are above a thousand years; and so long, at least, Dr. Swift thinks, we may allow the purity of the Greek; The Grecians spread their colonies round all the coasts and islands of Asia Minor, and the Egean sea, where the language was preserved entire for many ages after they themselves became provinces to Rome, and were overrun by the barbarous nations. The Chinese have books in their language above two thousand years old; neither have the frequent conquests of the Tartars been able to alter it. And the German, Spanish, and Italian, have admitted few or no changes for some ages past.

On such considerations, that rather moved the then prime minister, the earl of Oxford, to establish a society, or academy, for the settling, and ascertaining, the purity of our tongue; to set a mark on the improprieties which custom has made familiar, to throw out vicious phrases and words, to correct others, and perhaps retrieve some others now grown obsolete, and to adjust the orthography, pointing, &c.

Without some such means, he complains, that the same any writer can expect will be so short and scanty, as by no means to be a sufficient motive to call forth, and engage a man to exert his genius. Our language is chiefly confined to these two islands; and it is hard our authors fame should be limited in time as well as place. Were it not for the Bible and Common-prayer, we should hardly have been able to understand any thing written a hundred years ago.

It is a melancholy reflection, that Petrarch still speaks good Italian; whereas Chaucer, who lived an hundred years later, is not to be understood by an English reader without a Saxon and French glossary. And what security has Dryden himself, while things continue on their present footing, that he shall not in a like space of time become as obsolete as Chaucer is?

Grammars and dictionaries, with whatever care and judgment they are composed, will prove but a feeble stay to a fleeting language, unless they have some extraordinary sanction and authority. And, what is to be lamented, such writings have contributed to the corruption almost as much as the perfection of our tongue.

Dr. Gill, Ben. Johnson, and Hexham, it is certain, by forcing the English tongue to the Latin method, have clogged and perplexed it with abundance of useless precepts, concerning cases, genders, and declensions of nouns, senses, moods, and conjugations of verbs, and other things, which our language has nothing to do with. Nor have even Dr. Wallis, Greenwood, &c. though sensible of the fault in those others, been able wholly to keep clear of it themselves.

ENGOUTED, in *Falcoy*, is said of a hawk's feathers, when they have black spots in them.

ENGRAFTING, GRAFTING, or GRAFTING, in *Agriculture*, and *Gardening*, the art, or act, of inserting, or fixing, a cyon, shoot, or bud of one tree, in the stock of another; in order to correct, and improve its fruit.

Engrafting is the art of applying a *graft*, or shoot, of one plant, to the stock of another; in such manner, as that the sap passing freely through both, the tree *grafted* on may produce the same kind of fruit with that whence the *graft* is taken.

Engrafting only differs from *inculcation*, in this, that the latter is performed when the sap is at the highest, in summer; and the former before it rises, at least in any quantity.

Engrafting is one of the principal operations in gardening, and that wherein the goodness of great part of our fruit greatly depends.

It is very extraordinary, that the seeds, or kernels, or bones of a fruit, as an apple, pear, peach, plum, cherry, &c. being sown, degenerate in the ground; so that the tree arising from it is of another kind, a sort of wilding,

harder, lower, and coarser, than that of the parent tree. To correct this, trees thus reared must always be *grafted* from other better kinds.

Apples are commonly raised by *engrafting* the intended kinds on crab-stocks, procured by sowing the kernels; so are pears procured by *engrafting* on the wild pear-stock; though for dwarf, or wall-trees, they generally choose to *engraft* on the quince-stock.

They will also do if *grafted* on the white-thorn. Peaches are produced by *engrafting* on an almond or plum-stock. Indeed, in this fruit, it sometimes happens, that the stone sown produces better fruit than that from which it was taken; but this is not common; beside that the tree in such case is long before it comes to bear. Plums are raised by *engrafting* on a damascene, or wild plum-stock; and cherries, on the black cherry, or merry-stock, raised from stones.

Our best gardeners, likewise, *engraft* their best kindly trees from other better of the same sort, to mend them; as also, the smaller and single flowers, as gillflowers, &c. from the larger and finer. *See* *graft*. For the choice of *grafts* or *scions*, see *CLARE*.

The curious furnish us with other extraordinary and anomalous instances of *engrafting*; as of apples on plane, cherry, thorn, cabbage-stalk, &c. And the like of pears, &c. pears on apple-trees, on elms, &c. cherries on the laurel, coral-berries on the plum; beech on the chestnut, oak on the elm, gooseberry on the currant, the vine on the cherry-tree, &c.

Callunae, fagus, arnaxque incanuit alba

Flere pira; glandemque fusi frigore sub nimis

Id. lib. ver. 70, &c.

The origin and invention of *engrafting* is differently related by naturalists. Theophrastus tells us, that a bird having swallowed a fruit whole, chanced to call it forth into a cleft, or cavity, of a rotten tree; where mixing with some of the putrefied parts of the wood, and being washed with the rains, it budded, and produced within this tree another tree of a different kind. This led the husbandman to certain reflections, from which, soon afterwards, arose the art of *engrafting*.

Pliny sets the thing in a different light; a countryman having a mind to make a palisade in his grounds, that it might endure the longer, bethought himself to fill up, and strengthen the bottom of the palisade, by running, or wadding it with the trunks of ivy. The effect of this was, that the flakes of the palisade, taking root, became *engrafted* into the trunks, and produced large trees; which suggested to the husbandman the art of *engrafting*. The reason, or philosophy, of *engrafting* is somewhat obscure; and had not hazard given the first hint, all our knowledge of nature would never have led us to it. The effect is ordinarily attributed to the diversity of the pores, or ducts, of the *graft*, from those of the stock, which change the figure of the particles of the juices in passing through them to the rest of the tree.

Mr. Bradley, on occasion of some observations of Agricola, suggests something new on this head: the stock *grafted* on, he thinks, is only to be considered as a fund of vegetable matter, which is to be fitted through the cyon, and digested, and brought to maturity, as the time of growth in the vessels of the cyon dictates. A cyon, therefore, of one kind, *grafted* on a tree of another, may be more properly said to take root in the tree, than to be *grafted* in, than in unite itself with it; for it is visible, that the cyon preserves its natural purity and intent, though it be fed and nourished with a mere cobb; which is without doubt occasioned by the difference of the vessels in the cyon from those of the stock; so that *grafting* may be justly compared to planting.

In prosecution of this view of that ingenious author, we add, that the natural juices of the earth, by their secretion and comminution, in passing through the roots, &c. before they arrive at the cyon, must doubtless arrive there half elaborated and concocted; and is disposed for a more easy, plentiful, and perfect assimilation and nutrition; whence the cyon must necessarily grow and thrive better and faster than if it were put immediately in the ground, there to live on coarse diet, and harder of digestion; and the fruit produced, by this farther

prepa-

preparation in the cyon, must be finer and further exalted, than if fed immediately from the more imperfectly prepared and altered juices of the stock.

The cyon, to say no more, is somewhat in the condition of the fetus in utero, fed from the mother's blood; or, at least, it is in that of the infant after excretion, fed with the mother's milk.

Tools necessary for grafting. In order to grafting, a person must be provided with the following tools. 1. A nest and small hand-saw to cut off the heads of large stocks. 2. A strong knife with a thick back, to make clefts in the stocks. 3. A sharp pen-knife to cut the grafts. 4. A grafting chisel and a small mallet. 5. Half-lings, or else woollen yarn, to fasten on the grafts with; and, finally, a quantity of clay, which should be prepared a month before it is used, and kept turned and worked about every day like mortar. The best mixture for this matter is, a quantity of strong, fat, and viscous loam moist be got, and into this must be well beat and mixed some thumb-sore dung, and some chopped straw cut very short and finally, a quantity of common salt must be thrown in; this must be mixed up and beat together into a paste with water, but it must not be exposed to the frost. This is equally proper to be employed for all the different sorts of grafting. Miller.

Some persons have lately used a composition of turpentine, bees-wax, and rosin, melted together, which, applied round the graft about a quarter of an inch thick, will keep out the air more effectually than clay, be hardened by cold, and resist the frost, and fall off, when melted by the summer heat, without any trouble.

Principal kinds of grafting are, grafting in the cleft, grafting in the rind, white grafting, grafting by approach, scutcheon grafting, root grafting, related grafting, grafting on branches, &c.

GRAFTING in the cleft, or stock, called also *split-grafting*, is the most ancient and ordinary way. It is chiefly used for middle-sized stocks, from one to two inches diameter. Its season is in the months of February and March. The method, as now practised, is thus: the head of the stock being lown, or cut off, smooth and clean, with a slope, a perpendicular cleft is made therein, nearly two inches deep, with a strong knife or chisel, as near the pitch as may be to split it. In this cleft, the grafting chisel, or wedge is put to keep it open. The graft, or cyon, is prepared by cutting it slope, in form of a wedge to suit the cleft; only leaving a small shoulder on each side; and, when cut, it is to be placed exactly in the cleft, so as that the inner bark of the cyon may aptly and closely join to the inner part of the bark, or rind, of the stock; in the dextrous performance of which the chief secret consists. If the cleft pinch too tight, a small wedge may be left in it to bear the stress. And, lastly, the cleft is covered over with clay, leaving two eyes of thoscyon above the clay for shooting; or rather, as M. Geest advises, with moss, or the fresh bark of a tree bound on with oilier.

The reader, who would have this in more elegant terms, may be furnished from Virgil, Georg. ii. ver. 78, &c.

*Aut rursus rantes frangi viscatore & olei
Fusillat in solidum rivosque sua divide frange
Planta immittuntur; nec longum tempus, et ingens
Exist ad cultum ravis solibus arbor,
Miraturque novos frangere, & sua jura poma.*

GRAFTING in the rind, or shoulder-grafting, called also *fluting*, and *padding*, is practised in the latter end of March, or beginning of April. The method is as follows: The top of the stock is cut off in a smooth, straight place; then the cyon, or graft, is prepared by cutting on one side from the joint, or stem, down slopewise, making the slope about an inch long, and observing its bent, that so, when the cyon is fixed to the stock, it may stand nearly upright. At the top of the slope, they make a shoulder, whereby it is to rest on the slope of the stock. The whole slope is to be plain and smooth, that it may lie even to the side of the stock. As to the length of the cyon, for a standard-tree, it may lie about four inches from the shoulder; but for a dwarf, or wall-tree, six inches. The cyon being prepared, the outside is applied to the well, or fourth well-side of the stock, and its length and breadth measured thereon; which done, the bark of the stock is cut away to these dimensions, that the cut part of the cyon may fit it. Wherein, regard is to be had to the bigness of the stock, and the thickness of the bark, to proportion the length and breadth of the chip thereto; otherwise the passages of the juice in the stock and cyon will not meet. Lastly, laying the cut part of the cyon on that of the stock, they bind them together with woollen yarn, and cover the whole with clay an inch above, and as far below the stock's head, working it round the cyon till it becomes sharp at top, that the rain may run down it.

This method has several advantages over the former: as that the wound heals up sooner; and that, in the mean time, it is in less danger from the weather; that it does less injury to the stocks and grafts, as avoiding those severe splittings and pinchings; that the bark is more easily placed in the passage of the sap here, than in the cleft; that the graft thrives and shoots with greater vigour and bears sooner, in this way than in that; and that it is practicable on smaller stocks than the other, which must have a good body and confidence, before they can bear cleaving. See *CROWN-GRAFTING*.

GRAFTING in the bark is performed thus: prepare the stock and cyon, as in *grafting in the rind*, but instead of cutting the bark of the stock, slit the same on the fourth-well side, from the top, almost as long as the sloped part of the cyon, and at the top of the slit loosen the bark with the top of your knife. Thrust an instrument made of ivory, silver, or the like, and formed at the end like the horse-end of the cyon, but much less, down between the bark and wood to make room for the cyon; which being put in, the bark is to be so managed, as that it may fall close to the stock, and edges of the cyon.

GRAFTING by approach or abscission. See *ABSCISSATION* and *BRANCHING*.

All those trees which are of the same tribe, that is, which agree in their flower and fruit, will take upon one another; thus all the nuts may be *grafted* on one another; as may also all the plums, and all that are allied to them; as the almond, peach, nectarine, and the like; but as these generally lose a great deal of gum in the grafting, the operation of inoculation is much more proper for them.

All the trees which bear cones will succeed very well on one another, even though some shed their leaves in winter, and others do not. Thus the cone of Lebanon and the larch tree do very well on one another; but this, because they abound so greatly in resin, must be grafted by approach, because the resin of the graft being lost from it before it is set into the stock, makes it otherwise often miscarry.

Bad weather will often destroy the hopes of the best operator; otherwise with these regulations the whole generally succeeds very well; and is not only of use for the propagating many exotic plants, but even will make very tender ones bear our climate, by placing them on the hardier stocks of the same kind.

WHIP-GRAFTING, or TONGUE-GRAFTING, is a sort of grafting in the rind, proper for small stocks from an inch diameter to a quarter of an inch. Mr. Miller speaks of it as the most effectual way of any, and that most in use.

In this, the stock and cyon are always to be of the same bigness. The cyon is to be sloped off a full inch or more; and the like is to be done to the stock; and so the one to be tied to the other. Otherwise, the top of the stock being cut off, a shoulder is to be made in the graft; and the rest to be performed as already shewn under *grafting in the rind*.

This method is also improved by what they call *topping*, or *ringing*; which is, the making of a slit with a knife in the bare part of the stock, downwards; and the like in the sloped face of the cyon, upwards; then joining them, by slipping one slice into the other, till the bare place of the cyon cover that of the stock; then there should be a figure of bats to fasten the cyon, so that it may not easily be displaced, which should be covered with clay.

SIDE-GRAFTING. In this, the cyon is prepared as in *whip-grafting*; but the head of the stock is not cut off. Only, from a smooth part on the well side, so much of the bark is pared off as the cyon will cover; then fitting both cyon and stock, as in the last article, they bind the two together, and close them up with clay. At the year's end, the top of the stock is cut off at the graded place, slopewise; and the place is covered with clay.

SCUTCHEON-GRAFTING, is another method of grafting in the rind, practised in June, July, and August, when the bark will not part from the stock. It is performed by fitting the bark of the stock in form of the capital letter T, loosening it with the point of a knife, and clapping in a cyon, prepared as above. See *INOCULATION* and *SCUTCHEON*.

CROWN-GRAFTING, is when four or more grafts are placed round the stock, between the bark and the rind, somewhat in the manner of a crown. This is only practised in the larger trees which are capable of receiving a number of grafts, and are too big to be cleften. The method is in all respects the same as that already delivered for *grafting in the rind*.

ROOT-GRAFTING, is a modern invention, treated of at large by Agricola; its intention is somewhat different from the former, being for the propagation, or multiplication of plants.

To perform this, take a graft, or *scion*, of a young tree, which

which you intend to propagate; and a small piece of the root of another tree of the same kind, or of a kind very like it; or else pieces of roots cut off other trees, in transplanting, and *sub-graft* them together; observing, that the two butt-ends of the *graft* and root be joined, and that the end of the root join that of the *graft*. These may, afterwards, be planted out at pleasure, and the place of root will draw the sap, and feed the *graft*, as the stock does in the other way.

This way of propagation is very easy and expeditious; roots being more plentiful than stocks: by this method the pieces of roots of one crab-stock, or apple-stock, will serve for twenty or thirty apple *grafts*, and the like of other trees. The same is also an excellent way for raising of tender trees, that will hardly bear being grafted in the stock. Add, that trees thus *grafted*, bear sooner, and are more easily dwarfed, than those done in any other way.

Reiterated Grafting, or *grafting by a double, or triple incision*, is another method mentioned by Agricola: to perform which, first *graft* a good cyon on a stock, and cut it away to one half, or a third part; then fix another *graft* to its, of a better kind, and a third to that; for still the effecter a tree is *engrafted* the finer fruit it produces.

By this method, that author assures us, be produced muscat pears, that were admirable; making, at first, use of a stock *grafted* with a pound-pear, on which he *grafted* a summer bon chretien; and when the branch of this latter had shot, he *grafted* on it a cyon of bergamot; which he also cut, and *grafted* on it a cyon of a muscat pear.

ENGRAFTING of branches, Agricola mentions as a very certain and profitable operation, best practised on large, full-grown, and even old trees.

To do this, half or more of the branches must be leaved off, and *grafts* of three or four years old applied to them; taking care to have flakes, or other things, to support them against the wind, &c.

He adds, that by this method, you will have, perhaps, the same years; at least the second or third, such a quantity of fruit, as the youngest and soundest tree would hardly produce.

The facility with which *grafts* take place, and grow on proper subjects, is well known; there are, however, many accidents and uncertainties attending them in their different periods. Some perish immediately, some after appearing healthy for many months, some even after years of health. Of these last some die without the stock suffering any thing; others perish together with it. It is very certain that the greater part of *grafted* trees do not live so long as they would have done in their natural state; yet this is no unexceptionable rule, for there are some which evidently live the longer for this practice; nay, there are instances of *grafts*, which being placed on stocks naturally of short duration, live longer than when placed on those which are more robust and lasting.

There are irregularities which have been little considered hitherto, though they happen in a practice, the advantages of which are very great. One great requisite for the succeeding of any *graft*, is, that it be in its own nature capable of so close and intimate an union with the substance of the stock, that it becomes, as it were, a natural branch of it. If all trees resembled one another in their structure and juices, if their solid parts were all of the same figure, and their sap all of the same nature and confidence, their vessels all of the same diameters, and their elasticity, and the number of the trachee equal in all, and in all filled with the same quantities of air; if trees were alike in these particulars, probably *grafts* of all trees would succeed upon one another, but this is by no means the case.

The *grafts* of the almond on the plum, and of the plum on the almond, always grow very vigorously for the first year, and give all the appearance imaginable of succeeding entirely; yet they always perish in the second, or else in the third year. The almond *graft* upon the plum-stock always pulls out very vigorously at first, but the part of the stock immediately under the *graft* grows smaller, and perishes; the *graft* absorbing too much of its juices, and the *graft* necessarily perishes with it. The decay of the whole generally happens early in the spring, and that plainly from the different season of the natural shooting of the two trees, the almond pushing very vigorously, and consequently draining the stock of its juices, at a time when, according to its nature, the juices are but in small quantity in it, and the sap does not begin to ascend. The *grafts* of the plum on the almond are, from the same cause, furnished with an abundance of sap, which they have at that time no occasion for, and consequently they as certainly perish of repletion, as the other of imminution. Mem. Acad. Par. 1730. The peach *grafted* on the plum succeeds excellently, and

lives longer than it would have done in its natural state. The reason of which is this: the peach is a tender tree, it shoots with great vivacity, and produces more branches than the root is able to maintain, which is the reason why peach-trees are usually full of dead wood, and often their large branches perish, and sometimes their whole trunk; on this occasion, the plum being a slow shooting tree, communicates its virtue to the *graft*; and the peach consequently sends out shoots, which are more robust and lasting, and are no more in number than the root is able to supply with nourishment; hence the tree is more strong and lasting. Miller.

See an account of methods of *engrafting* for improving and hastening the fruit, under **FRUIT-TREES**.

ENGRAFTING of the small pox. See **VACCINATION**.

ENGRAILED, or **INGRAILED**, in *Heraldry* (from the French *grêlé, hail*) is when a thing is prefaced with its edges ragged, or notched, semicircularly, as if broken by something falling on it. See **Tab. II. Herald. fig. 57**. See **INDENTED**, and **INVECTED**.

Speelman expresses it in Latin by *imbricatus*; others by *regradatus*; and others by *stratus*.

ENGRAVERS. See **ENGRAVING**.

By 8 Geo. II. cap. 13. *engravers* that shall invent, design, and engrave prints, have the sole right of printing them for fourteen years, which are to be engraved with the names of the proprietors; and others copying and selling such prints, though by varying &c. without their consent, shall forfeit *cl.* for every print, and also the plates and sheets, &c. This privilege was continued for twenty-eight years by 7 Geo. III. cap. 38. And by 17 Geo. III. cap. 57. double costs are given.

ENGRAVING, or **GRAVING**, the art, or act, of cutting metals, and precious stones, and representing figures, letters, and other matters, thereon.

The word is a compound of the preposition *in*, and *gravo, I write*. Though Menage, after Salsmapus, derives it from the Latin *excavo, to hollow*; others from the Latin *græpho*; and others from the German, *graben, to dig*, or *to dig out*. In Latin it is called *sculptura*, and *sculptura*.

Engraving is properly a branch of sculpture; though with us it generally stands contradietionally from sculpture; as the latter, popularly called *carving*, expresses the forming of figures, &c. embossed, or in relief; and the latter, those intended, or incised.

Among the French, the term *engraving, gravure*, is of larger extent. It includes all kinds of sculpture, both that performed with the chisel and knives on marbles and woods in relief; and that in metals, stones, &c. with the graver indented.

Engraving is divided into several branches, according to the matters it is practised on, and the manner of performing it. The original way of *engraving* on wood is now distinguished by the name of *cutting in wood*, that on metals with aqua forte, is called *etching*; that by the knife, burnisher, punch, and scraper, *mezzotinto*; that on stones, for tombs, &c. *carving*, or *finishing*; and lastly, that performed with the graver on metals as copper, brass, steel, silver, &c. as also on precious stones, crystals, &c. retains alone the primitive denomination of *engraving*.

Engraving is an art, for the greater part, of modern invention; having its rise no earlier than the middle of the sixteenth century. The ancients, it is true, practised *engraving* on precious stones and crystals, with very good success; and there are still many of their works remaining, equal to any production of the later ages. But the art of *engraving* on plates, and blocks of wood, to afford prints, or impressions, was not known till after the invention of printing in oil.

The discovery is ascribed to Miso Finiguerra, a goldsmith of Florence, about the year 1460; who having tried to take impressions of every thing he cut in clay, and to cut melted sulphur in this mould, at length perceiving that what came out of the mould was marked with the same prints as his plate, by the black which the sulphur had taken from his graving, he tried to do as much on silver plates, with wax paper, by rolling it smoothly with a roller which also succeeded. This was the origin of producing impressions upon paper in lines, as prints are now done; but the art of *engraving* them seems to have been of earlier date. See **PAINTING**.

By him it is said to have been communicated to Baldini, a goldsmith of the same city, who engraved several plates from drawings of Botticelli, and was afterwards assisted by Andrea Mantegna, of Padua, who improved the art. However, the Germans pretend that this art was practised among them by Lapprecht Ruff, the master of Schoen, as early as the year 1450. Other German writers ascribe the invention of it to Francis a Boetius, who was immediately succeeded by Hieronim Moekelich, and Martin Stock, Albert Durer's master. The Dutch pretend

tend that the art of taking off impressions on wood was discovered by Lawrence, of Harlem, who died between the years 1435 and 1440; and that of engraving on copper by Peter Schoeffer, a printer of Metz; and that it was carried into Germany and Italy by his workmen, when Meiss was taken in 1562.

However, the secret soon got abroad, and coming to the hands of Martin Schöen, of Colmar, in Germany, who is said to have practised this art from the year 1460 to 1470; Albert Dürer, who was born at Nuremberg in 1470, and died in 1528; Lucas of Leyden, born in 1494, and who died in 1533; and Marco Antonio of Bologna, in the beginning of the sixteenth century; they greatly improved it, and began to engrave on wood and copper, in which they succeeded to admiration. See *Hutchinson's History of Chalcography*.

ENGRAVING in copper, is employed in representing diverse subjects, as portraits, histories, landscapes, foliage, figures, buildings, &c. either after paintings, or after designs made for this purpose.

It is performed with the graver, dry point, or with aqua fortis. For the first, there needs but little apparatus, and few instruments. The plate you work on being well-polished (for the method of preparing which, see *Copper-plate*), is covered over with a thin skin of virgin-wax, and on this the draught, or design, done in black lead, red chalk, or other unguined matter, is laid; and rubbed down for the wax to take off. The design thus transferred upon the wax, is traced through on the copper, with a point or needle; then heating the plate, and taking off the wax, the strokes remain; to be followed, heightened, &c. according to the tenor of the design, with the GRAYER, which is to be very sharp, and well tempered.

The dry point, or needle, which has been of late much used in engraving, is a tool like an etching point, which being drawn back on the copper, cuts a stroke, and raises a burr; the burr is scraped off, and there remains a stroke more soft and delicate than can be produced in any other way.

In the conduct of the graver and dry point consists all the art; for which there are no rules to be given; all depending on the habit, disposition and genius of the artist. However, some general observations and directions may not be improper. As the principles of engraving are the same with those of painting, a person cannot expect to attain any considerable degree of perfection in this art who is not a good master of design; and therefore he ought to be well acquainted both with perspective and architecture; for the former, by the proper degradations of strong and faint colours, will enable him to throw backwards the figures and other objects of the picture or design which he proposes to imitate; and the latter will reach him to preserve the due proportion of its several orders, which the painter often entrusts to the discretion of the engraver. In order to preserve equality and union in his works, the engraver should always sketch out the principal objects of his piece before he undertakes to finish them. Care should be taken that the graver be carried level upon the plate, and be pressed, as occasion requires, with greater or less force, carrying the hand as evenly as possible. In drawing straight lines, a less degree of pressure serves for those that are finer, and a greater is required to form the broader and deeper lines. In forming circular or curved lines, the hand and graver must be held steady, and the plate is to be moved upon the cushion under the graver. In large works a cushion is useless. The engraved work may be rendered more visible, by rubbing it over with a roll of felt, dipped in oil.

The strokes of the graver should never be crossed too much in a hasty manner, particularly in the representation of flesh, because sharp angles produce the unpleasant effect of lattice work, and take from the eye the repose which is agreeable to it in all kinds of picturesque designs: we should except the case of clouds, tempests, waves of the sea, the skins of hairy animals, or the leaves of trees, where this method of crossing may be admitted. But in avoiding the lozenge, it is not proper to get quite into the square, which would give too much of the hardness of stone. In conducting the strokes, the action of the figures, and of all their parts, should be considered; and it should be observed how they advance towards, or recede from the eye; and the graver should be guided according to the ridges or cavities of the muscles or folds, making the strokes wider and fainter in the light, and closer and firmer in the shades. Thus the figures will not appear jagged; and the hand should be lightened in such a manner, that the outlines may be formed and terminated without being cut too hard; however, though the strokes break off where the muscle begins, yet they ought always to have a certain connection with each other, so that the first stroke may con-

serve by its return to make the second, which will give the freedom of the engraver.

In engraving the flesh, the effect may be produced in the lighter parts, and middle tints, by long pecks of the graver, rather than by light lines, or by round dots, or by dots a little lengthened by the graver, or, best of all, by a judicious mixture of these together.

In engraving the hair and the beard, the engraver should begin his work by laying the principal grounds, and sketching the chief strokes in a careless manner, or with a few strokes; and he may finish it at leisure with finer and thinner strokes to the extremities. When architecture, or sculpture, is to be represented, except it be old and ruinous buildings, the work ought not to be made very black; because, as edifices are commonly constructed either of stone or white marble, the colour, being reflected on all sides, does not produce dark or brown shades, as in other substances. White points must not be put in the pupils of the eyes of figures, as in engravings after paintings; nor must the hair or beard be represented as in nature, which makes the looks appear flowing in the air; because in sculpture there can be no such appearance.

In engraving cloths of different kinds, linen should be done with finer and closer lines than other sorts, and be executed with single strokes. Woolen cloths should be engraved wide, in proportion to the coarseness or fineness of the stuff, and with only two strokes; and when the strokes are crossed, the second should be smaller than the first, and the third than the second. Shining stuffs, which are generally of silk or satin, and which produce flat and broken folds, should be engraved more hard and more straight than others, with one or two strokes, as their colours are bright or brown; and between the first strokes other smaller must be joined, which is called interlining. Velvet and plush are expressed in the same manner, and should always be interlined. Metals, as armour, &c. are also represented by interlining, or by clear single strokes. In architecture, the strokes which form the rounding objects should tend to the point of light; and when whole columns occur, it is proper to produce the effect as much as possible, by perpendicular strokes. If a good stroke is put, it should be at right angles, and wider and thinner than the first stroke.

In engraving mountains, the strokes ought to be frequently discontinued and broken, for sharp and craggy objects; and they should be straight, in the lozenge manner, and accompanied with long points or dots; and rocks should be represented by cross strokes, more square and even. Objects that are distant towards the horizon should be kept very tender, and slightly charged with black. Waters that are calm and still are best represented by strokes that are straight, and parallel to the horizon, interlined with those that are finer; omitting such places as, in consequence of gleams of light, exhibit the shining appearance of water; and the form of objects, reflected from the water, at a small distance upon it, or on the banks of the water, are expressed by the same strokes, re-touched more strongly or faintly, as occasion may require, and even by some that are perpendicular. For agitated waters, as the waves of the sea, the first strokes should follow the figures of the waves, and may be interlined, and the cross strokes ought to be very lozenge. In cascades, the strokes should follow the fall, and be interlined. In engraving clouds, the graver should sport, when they appear thick and agitated, in turning every way according to their form, and their agitation. If the clouds are dark, so that two strokes are necessary, they should be crossed more lozenge than the figures, and the second strokes should be rather wider than the first. The flat clouds, that are left insensibly in the clear sky, should be made by strokes parallel to the horizon, and a little waving; if second strokes are required, they should be more or less lozenge, and when they are brought to the extremity, the hand should be so inclined, that they may form no outline. The flat and clear sky is represented by parallel and straight strokes, without the least turning.

In landscapes, the trees, rocks, earth, and herbage, should be etched as much as possible; nothing should be left for the graver but perfecting, softening, and strengthening. The dry point produces an effect more delicate than the graver can, and may be used to great advantage in linen, skies, distances, &c. and often in water, especially in small engravings. In most things it is proper to etch the shadows, only leaving the lighter tints for the dry point, graver, &c. *Encyclopédie, art. GRAVER; and Handmaid to the Arts, vol. ii. p. 63.*

The other instruments, besides the graver and dry point, are, a cushion, or sand-bag, to lay the plate on, to give it the necessary turn and motion; a burnisher, round at one end, and usually flatish at the other, to rub out

flips and failures, and to *loosen* the strokes, &c. A scraper to pare off the surface, on occasion; and a rubber of black cloth, or hat, to fill up the strokes, that it may appear how the work proceeds.

To take off printed cuts, so that the outlines and principal strokes may be exactly copied for engraving, may be thus performed: If the print be not above a year or two old, the paper need only be moistened with water in the manner usually practised for printing cuts; but if it be more ancient, it should be laid to soak all night in water, and afterwards hung in the air till it becomes dry enough for the press. The paper, thus prepared, is to be laid with its printed side next the plate, thinly coated over with white wax, which is thus to be committed to the rolling press, whereby an impression of the cut will be obtained. *Boyle's Works*, vol. i. p. 136.

ENGRAVING in copper with aqua fortis. See **ETCHING**.
ENGRAVING in chalk is the art of imitating on counterfeiting upon copper, drawings made with chalk on paper. This method of engraving was invented by M. Francis, to whom the king of France granted a pension for the discovery. It is intended to form a kind of deception, so that the connoisseur may not be able, on the first inspection, to distinguish between the original drawing and the engraving made in imitation of it; and it is extremely useful, as it serves to multiply copies of drawings left by those masters who excelled in the use of chalk, and thus to form and improve young artists, who could not have access to the originals in the practice of drawing. This kind of engraving is now performed with the points of the graver, as in the usual manner in copper-plate engraving, but by a mixture of varied and irregular dots, as being more proper to resemble the grain produced by the chalk on paper, more or less soft. Every stroke of the chalk on paper may be considered as an infinite number of adjoining points, which are the small eminences of the grain of the paper, touched by the chalk in passing over it. When the copper plate has been polished and varnished, or properly prepared, as in the common method of engraving, the drawing to be imitated may be counterpoised on the varnish of the plate. If this cannot be conveniently done, black lead pencil, or red chalk, must be applied to varnished or oiled paper, and by means of this chalk, or pencil, all the traces of the original will be transmitted to the varnish. See **CALCOPINO** and **ENGRAVING**, above.

The outlines of the object must be formed in the etching by points, whose magnitude and distance must be determined by the quality of the strokes in the original drawing. The artist may be provided with pointed instruments, or needles, of various sizes, with single or double points. In forming the light and shade, he should distinguish between those hatches which serve to express the perspective of the object, and those which form the ground of it. The principal hatches should be more strongly marked, the middle ones, if etched, should be marked lightly, or they may be left till the varnish is taken off, and be perfected with a greater degree of softness, by needles, or the point of the graver, as the artist may require. There is nothing peculiar in the method of applying the aqua fortis in this kind of engraving; but it may be observed, that it should not be left so long as to corrode the lighter parts too much; if the light parts are sufficiently corroded, they may be stopped out with turpentine, varnish, and lamp-black, mixed together; and the aqua fortis may be applied again to the stronger parts; for it will be no detriment to them, if the points which compose the shade burst into one another, provided the extreme be avoided. When the work of the aqua fortis is finished, and the varnish taken off the copper, it will be necessary in the softest parts, such as the flesh, &c. to intersperse with proper points; as an effect will thus produced more delicate than it is possible to attain with the aqua fortis only; and the strongest shades will require additional strength, to be given them with small strokes of the graver. This sort of engraving should be scraped before it is finished.

Drawings made with chalks of different colours may be imitated in this manner, if a plate be provided for every colour. *Encyclopædie*.

ENGRAVING in aqua tinta is the art of imitating upon copper drawings made with bluish, or Indian ink.

ENGRAVING in mezzotint. See **MEZZOTINT**.

ENGRAVING on precious stones, is the representing of figures, or devices, either in relief, or indented, on diverse kinds of hard, polished stones.

The art of engraving on precious stones is one of those wherein the ancients excelled: there being diverse antique agates, cornelians, and onyxes, which surpass any thing of that kind the moderns have produced. Pergoles among the Greeks, and Dioscorides under the first emperors of Rome, are the most eminent engravers we

read of; the former was so esteemed by Alexander, that he ordered any body else to engrave his head; and Augustus's head, engraved by the latter, was found so beautiful, that the succeeding emperors chose it for their seal.

All the polite arts having been buried under the ruins of the Roman empire, the art of engraving on stones shared the same fate. It was retrieved in Italy, at the beginning of the fifteenth century; when one John of Florence, and after him Dominic of Milan, performed works of this kind far from being contemptible. From that time, such sculptures became common enough in Europe, and particularly in Germany, whence great numbers were sent into other countries; and they came short of the beauty of those of the ancients, especially those on precious stones; for as to those on crystal, the Germans, and after their example the French, &c. have succeeded well enough in them.

In this branch of engraving they make use either of the diamond or emery. The diamond, which is the hardest and most perfect of all precious stones, is only cut by itself, or with its own matter.

The first thing is to cement two rough diamonds to the ends of two sticks, big enough to hold them steady by, in the hands; and to rub or grind them against each other, till they be brought to the figure desired. The dull, or powder, rubbed off, serves afterwards to polish them, which is performed with a kind of mill, that turns a wheel of lead, pewter, or copper.

The diamond is fixed in a brass dish, and thus applied to the wheel which is covered with a diamond dust, mixed up with oil of olives; and when the diamond is to be cut facet-wise, they apply first one face, then another, so the wheel.

Rubies, sapphires, and topazes, are cut and formed the same way, on a copper-wheel; and polished with tripoli, diluted in water.

As to emeralds, hyacinths, amethysts, garnets, agates, and other of the softer stones, they are cut on a leaden wheel, moistened with emery and water, and polished with tripoli, on a pewter-wheel. Lapis lazuli, opal, &c. are polished on a wooden-wheel.

To fashion and engrave vessels of agate, crystal, lapis lazuli, or the like, they have a kind of lathe, like that of the potters; excepting, that whereas the latter is to hold the vessels, which are to be wrought with proper tools; the former generally holds the tools, which are turned by a wheel, and the vessel is held to them to be cut and engraved, either in relief, or otherwise; remembering from time to time to moisten the tools with diamond-dust and oil, or, at least, with emery and water.

To engrave figures or devices on any of these stones, when polished, such as medals, or seals, &c. they use a little iron wheel, the two ends of whose axis are received within two pieces of iron placed upright, as in the turner's lathe, and to be brought closer, or set farther apart, at pleasure. At one end of one of these axes are fixed the proper tools, being kept tight by a screw. Lastly, the wheel is turned by the foot, and the stone applied by the hand to the tool; and thus finished and conducted as occasion requires.

The tools are generally of iron, sometimes of brass. As to their form, it is various, but it generally bears some resemblance to chisels, gouges, &c. Some have small round heads like buttons; others like ferrules, to take the pieces out; others flat, &c. These tools are not applied directly against the stones, but, as it were, *side-wise*; thus wearing, and, as it were, grinding off the substance. And still, whether it be figures, or letters, or characters, the manner of application is the same. The tools, as above observed, are to be frequently moistened with diamond dust, and oil of olives. When the stone is engraved, they polish it on a wheel of bristles, made of hog's bristles, with tripoli. For the larger, and less delicate works, they have copper, or pewter tools, on purpose to polish the ground, or plain parts, with tripoli, &c. which they apply after the same manner as those wherewith the graving is performed.

ENGRAVING on steel is chiefly employed in cutting punches, matrices, and dies, proper for striking coins, medals, and counters.

The method of engraving, with the instruments, &c. are the same for coins, as for medals and counters: all the difference consists in their greater, or less relief; the relief of coins being much less considerable than that of medals; and that of counters still less than that of coins. The engraver in steel usually begins with punches, or punchions, which are in relief, and serve for making the creux, or cavities of the matrices, and dies; though sometimes he begins immediately with the creux; but it is only when the intended work is to be cut very shallow. The first thing is to design his figures; then he

other nations, who were disposed to accommodate the lunar months to the solar year, made use of the *enneadactylis*: allowing to seven of the years thirteen months apiece, and to the rest twelve. See CYCLES, and EMBOLISMIC.

ENNEADACTYLIS, the *Jewish*, is properly a cycle of 19 lunar years, beginning from *anab tulu*, and returning again and again; whereas every 30, 6th, 8th, 11th, 14th, 17th, and 19th, are embolismic, or of 383 days 21 hours apiece; the rest common, or of 354 days 8 hours apiece. See YEAR.—Consequently, the Jewish *enneadactylis* is 6923 days 18 hours.

ENNEAGON, in *Geometry*, a figure of nine angles, and nine sides.

The word is formed of *enna*, nine, and *agon*, angle.

ENNEAGON, in *Fortification*, denotes a place with nine bastions. See FORTIFIED PLACE.

ENNEAHEKEDRIA, in *Natural History*, the name of a genus of *spira*.

The word is derived from the Greek *enna*, nine, and *heka*, a hole.

The bodies of this genus are *spira*, composed of nine planes, in a trigonal column, terminated at each end by a trigonal pyramid. Of this genus there are four known species. Hist. III. of Foss. p. 208.

ENNEANDRIA, in *Botany*, the ninth class of plants, with hermaphrodite flowers, and nine stamens, or male parts, in each.

The word is derived from the Greek *enna*, nine, and *andria*, male.

This class comprehends three orders; viz. the *managria*, having one style, of which there are four genera; the *trigria*, having three styles including one genus; and the *hexagria*, having six styles, and consisting one genus. The plants of this class are the bay-tree, shrubby, &c.

ENNEATEICAL days are every ninth day of a sickness; which, some imagine, naturally occasion a great alteration, either for the better, or worse.

ENNEATEICAL years are every ninth year of a man's life. See CLIMATERIC.

ENNEATEIMERIS is one kind of the *casura* of a Latin verse, where, after the fourth foot, there is an odd syllable ending a word, which helps to make the next foot with the following word; as in this instance,

His latus nigrum molli fulvis hy-cintho.

where all the four kinds of the *casura* occur.

ENNEOPHTHALMIUS, from *enna*, nine, and *ophthalmos*, eye, in *Ichthyology*, a name given, by some, to the lamprey.

ENNERIS, in the *Ancient Ship-Building*, a name given to those GALLEYS, or vessels, which had nine tiers of rowers. These were of a very considerable size; though Meibom has found so convenient a method of placing the rowers, that he has taken off very much from that immense height others supposed they had above the water. We read of the refinements, and other amazing vessels of this fabric: that of Philopater having forty rows of oars, and that of Ptolemy Philadelphus thirty; and some others which are spoken of, twenty. It has been disputed by many, whether such large vessels as those were ever actually built, or used; but Meibom gives great reason to believe, that they really were, though he, at the same time, alleges against Salmastius, and the more sanguine admirers of the works of the ancients, that very few vessels were built larger than these *enneris*, or nine-tiered ones, and proves it from Livy and Plutarch, and from Polybius. We are apt to admire, in many cases, what we ought also to imitate, but never attempt it. This is the case in these galleys; and Meibom, who has given the rules of this ancient naval architecture, is of opinion, that by imitating it at present, modern galleys and galleasses might be built much more conveniently both for strength and celerity, and also at less expence than they are at present. Meibom de Triem. The modern form is indeed allowed to be better than theirs, but if, in the structure, the proportion of the long ships of the ancients were observed, they might be greatly improved; in the modern way of five men sitting at one oar in the galleasses, much strength is wasted to no purpose, because they sit too near to the fulcrum, or stay, whereas, as a small number of rowers, at a greater distance from the stay, would give more strength, and throw the vessel along much more easily, and would require less charges. Galleys of this sort, thus managed at a small expence, would be found of great use in the larger rivers, and in the shallow seas, and therefore convenient for the Baltic, the Britanick, and the Mediterranean seas, and would be the most useful of all vessels for transporting great numbers of forces.

ENOLIMIS, *Enchyma*, in *Astology*, a designation given to Apollo's priestess at Delphi, because she sat on the tripod which was called *alona*, stone. Hence also Apollo is

called *Enolima*, *Enchyma*. Pott. Archæol. Græc. lib. ii. cap. 9. tom. 1. p. 275.

ENORAINE, in the *Almanac*, a wither-wring house, of one that is spoiled in the withers. The word is obsolete.

ENORCHIS, in *Natural History*, the name given, by many authors, to that species of *stiles*, or eagle-tongues, in which the callus, or internal nucleus, is not loose, so as to rattle in it when shaken, but remains fixed to one bone. The Germans call this *ladeflange*. The outer crust is usually of a whitish colour, and the internal nucleus is whitish or brownish, and it is usually of the size of a pigeon's egg, and of the shape of the human scapula, whence the name.

ENORMOUS, something excessive, or monstrous, especially in bulk. The colossus of Rhodes was of an enormous stature.

The word is formed of the privative *n*, and *orma*, rules; q. d. void of, or contrary to, rule or measure, *conformitudo*. In the corrupt ages of Latinity, they used *inormis*, and *inormia*.

In the French jurisperudition, *lesu enormis, enormis domage*, is that which exceeds half the value of the thing sold.

ENQUEST, or *INQUEST*, in *Law*, denotes an inquisition of a jury by hearing of witnesses.

This is the most usual manner of trial, in all causes, both civil and criminal, within this realm. In civil causes, after proof is made, on either side, of so much as each party thinks good for himself; if the doubt be in the *fact*, it is referred to the discretion of twelve indifferent men, impeached by the sheriff for that purpose; and as they bring in their verdict, so judgment passeth: for the judge saith, *the jury findeth the fact true*. For the *enquest* in criminal causes, see JURY.

ENRICHED column. See COLUMN.

ENRICHING plants, a term used by the English farmers, to express such plants as are found to do good to land, rather than to exhaust it, and in consequence of which the same piece of land will produce a good crop of corn, though it would without the assistance of their having been planted on it, have yielded a very poor one. The myth of this difference between plants, some of which are found to burn up, that is, impoverish lands, while others enrich it, is explained by Mr Tull. This author having observed, that breaking the earth, by digging, or horse-hoeing, between the plants, gave them great increase, found that it was this practice that enriched the earth; and that, while corn and such plants as stand close, and cannot be hoed between, impoverish the ground, and suffer no means of *enriching* it again to be used, there were some other things, the crops of which being planted thinner, gave room to the earth to be ploughed, dug, or hoed between, and that these were the plants which were called the *enriching* kind by the farmers; and the whole secret lay in this, that the hoeing, ploughing, or other ways breaking the earth between them, in order to kill the weeds, enriched the ground greatly more, in proportion, than these plants exhausted it; and the consequence was, that though they had thriven very well, yet the earth was left richer than before, notwithstanding all that they had laboured from it. Tull's Horsehoeing husbandry, p. 37.

On this observation, this excellent author seems to have founded the system of what he calls horsehoeing husbandry, concerning which he has written a large and useful treatise. He found that this stirring up of the earth enriched it so greatly, that, where it was used in a proper manner, the kind of plant need not be changed, but that the same earth would yield a successive series of crops of the same plant, and that even without dunging, or ever lying fallow, and every crop, for a long time, would be better than the former one. The method of sowing, to this purpose, is not by scattering the corn with the hand, but sowing it in rows, and leaving large intervals between, the naked earth of which might be turned up by the hoe. See ALLEY and HOING.

ENROLLMENT. See ENROLLMENT.

CLERK of the ENROLLMENT of fines. See CLERK of the *Intestaments*.

ENS, ENTITY, *Being*, in *Metaphysics*, is applied, in a general sense, to every thing which the mind any way apprehends, and whereof it affirms, denies, proves, or disproves, any thing. This other philosophers call *ensibile*, and *intelligibile*; and the logicians, *thema*.

ENS, in a less general sense, signifies something that is, or exists, some way farther than by being conceived, or being capable of being conceived, in the mind. This is particularly called *ens positivum*, or *realis* positive, or real, being, in opposition to which stands *ens ens*.

ENS, in its proper, or restrained sense, is that to which there are real attributes belonging; or that which has a reality, not only out of the intellect, but in itself. This

is what is properly meant by *res, thing*; and what we otherwise call *ens reale*, and also *substance*.

ENS RATIONIS, is that which depends wholly on the mind, or which exists only in the imagination: of which they distinguish three kinds: *ens rationis effectivum*, which is done or produced by the mind, as knowledge; *ens rationis subjektivum*, which is received into the mind, as sensation; and *ens rationis obiectivum*, which is represented by the mind, as a chimera, a golden mountain, or the like. Which last, if it have no other manner of being, is, &c. if it be represented to us as it does not, or cannot be, is what we most properly call, *ens rationis*. The generality of school philosophers, and the Peripatetics among the rest, assert, that there are of these *ens rationis obiectiva*. Others deny there are, or can be, any such things.

ENS, or *ENS PRIMUM*, in Chemistry, denotes the most efficacious part of any natural mixt body, whether animal, vegetable, or fossil, wherein all the qualities or virtues of the ingredients of the mixt are comprehended in a small compass.

Paracelsus pretends to have been able to separate the *ens primum* from bodies, and with it to effect prodigious things towards the renovation and restoration of youth; but his processes are by so obscurely delivered, that no body has been induced to try them.

Mr. Boyle gives us a process from M. le Febvre, whereby the *ens primum*, or essence of baum, is easily obtained; he adds, that the effects of an *ov* of baum, thus drawn, are no ways inferior to those of Paracelsus; and instances in a special friend of his, upon whose taking it only for a fortnight, the nails of his hands and feet fell off, and were succeeded by a set of new ones; which convinced him so far of its efficacy, that he left off taking it himself; but giving some of it to an old woman of seventy years of age, who lived in the house, it produced the menies again; and that so copiously, as wonderfully to flatter the woman.

Upon giving a little of it to an old hen, her feathers began to moult on the sixth day, and she became stark-naked; but before a fortnight was over, she had others in their room, which were fairer, and better coloured than the former.

The relation is odd enough; yet, considering the authority from which we have it, and how easily the thing is tried, it is surprising no body has yet attempted to prosecute it. The process is this:

Having gathered, &c. some baum, or other proper plant, at the proper season and time, beat it into a pulp in a marble mortar; and, putting it into a bolt-head hermatically sealed, digest it forty days on a dung-hill, or other analogous heat: this done, take out the matter, which will now be more liquid than before; and separating from it the dregs or grosser parts, digest it anew in a gentle bath, that the remaining grosser parts may also subside; filtrate it, and add to it the fixed salt drawn from the former dregs, dried and calcined; to the liquor thus prepared, add equal parts of the liquor of good sea-salt, well purified and melted, and then let it run per deliquium; lastly, seal up the mixture in a bolt-head, and expose it to the sun six weeks longer; at the end of which term, the *ens primum* of the plant will be found swimming on the liquor, in a liquid, transparent form, sometimes of a green, and sometimes a reddish colour, according to the plant used.

ENS PRIMUM JALICUM, a name given by Paracelsus to a preparation of sea-salt, which he calls also a perpetual oil, and *sal circulatum*, which see.

ENS VENARI, or *flower of Venus*, a chemical preparation from vitriol, first published by Mr. Boyle, held as a specific in the rickets, and much commended in nervous cases, obstinate cachexies, loss of appetite, and obstructions of all kinds.

It is prepared by subliming equal parts of the powder of Cyprus vitriol (calcined till it is of a dark colour) and of sal ammoniac, into the form of yellow flowers. It has its name from the particles of Venus, copper, imparted to it by the vitriol.

ENS MARTIS, is the flower of iron sublimed with the same salt.

ENSAL, in the *Materia Medica*, a name used by some authors for the common small cardamom of the shops.

ENSCONCED, in the *Military Art*. See *INSCONCED*.

ENSEELED, in *Falconry*, a term used for a hawk which has a thread drawn through her upper eyelids, and made fast under her beak, to obscure her sight.

ENSEMBLE, a French term, sometimes used in our language, literally signifying *together*, or *one with another*; being formed from the Latin, *in*, and *simul*.

In *Architecture*, we say, the *ensemble*, or *tout ensemble* of a building; meaning the work or composition, considered together, and not in parts; and sometimes also the relative proportion of the parts to the whole. All those pieces of building make a fine *ensemble*.

VOL. II. N^o 114.

To judge well of a statue, or other work of sculpture, one must first examine whether the *ensemble* be good.

The *tout ensemble* of a painting, is that harmony which results from the distribution of the several objects or figures whereof the whole is composed. This picture is good, taking the parts separately; but the *tout ensemble* is bad.

ENSIFORM Leaf, in *Botany*. See *LEAF*.

ENSIFORMIS, *id ensis, sword*, and *forma, shape, Carilage*. See *CHRISTODUS*.

ENSIGN, in the *Military Art*, a banner or colours, under which the soldiers are ranged, according to the different companies or parties to which they belong. When a battalion is encamped, they are placed in its front; but in garrison they are lodged with the commanding officer. There is a smaller sort, called camp-colours, placed on the right and left of the parade of a regiment when in the field. See *FLAG* and *STANDARD*.

The Turkish *ensignes* are horses tails; the number of which distinguishes the rank of their commanders; the sultan has seven, the grand vizier only three, &c. Those of the Europeans are pieces of taffety, with divers figures, colours, arms, and devices, thereon: Xenophon tells us, that the *ensigne* borne by the Persians was a golden eagle on a white flag; the Corinthians bore the winged horse, or Pegasus; the Athenians, an owl; the Medians, the Greek letter M; the Lacedaemonians, the A. The Romans had a great diversity of *ensignes*; the wolf, minotaur, horse, bear, and at length the *EAGLE*. See *SIGNS*.

A military *ensigne*, on a medal of a Roman colony, denotes it a colony peopled with old soldiers.

ENSIGNS, in a *Ship*, are those colours which are hoisted on a long pole erected over the poop, and called the *ensign-staff*. There are few ships, whether men of war or merchants, but have their *ensignes*. Their chief use is, that when any strange ships meet at sea, or make into any harbour, by heaving out the colours in the poop, that is, putting their *ensignes* ahead, they discover of what part and country they are, and serve to characterise the different squadrons of the navy. Thus, the British heave out their colours with a double cross, viz. that of St. George and St. Andrew, framed into an union, upon a field which is either red, white, or blue; and so all other countries with some particular distinction, whereby they may be known. The *ensignes* serve also for many other uses. See *FLAG*.

ENSIGN, is also used for an officer in the infantry, who bears the *ensigne* or colours; by the Latins called *signifer* and *vestibler*.

He has the charge of the *ensigne* in battle; and, if he be killed, the captain is to take it in his stead. The *ensigne* is the lowest commissioned officer in a company of foot, under the command of the lieutenant; and, in his absence, supplies his post. In cataly, the *ensigne* is termed a cornet. See *CORNET*.

ENSTASIS, *Enstasis*, of *en* and *stasis*, *stasis*, in *Logic*, a manner of replying to an opponent, either by confuting his argument, or denying the justness of his conclusion. Voss. Rhet. lib. iii. p. 385.

ENSTASIS, in *Medicine*, a term used to express the ingress of molecule into the vacuity of the pores which obstruct them, and thereby cause disease. It is a word familiar with Erasistratus and Aesclepiades, who was a follower of Democritus, and taught that most diseases were caused by such an ingress of matter into the pores. Thus Aesclepiades defined a phreny to be such an *enstasis* in the membranes of the brain. Placchus, in his Precepts of Health, also mentions this *enstasis*; and Galen and Cassius, who is supposed to have been of the sect of the Rationalists, express the same sense by the same word.

ENTABLATURE, in *Architecture*, is that part of an order of column which is over the capital, comprehending the ARCHITRAVE, FRIZE, and CORNICHE.

The word seems formed of *tabulation*, or *incubation*. The *entablature* is also called the *trabeation*; and by Vitruvius and Ygnol, *ornament*. It is different in the different orders; indeed, it consists of the three grand parts or divisions above mentioned, in all; but those parts consist of a greater or less number of particular members or subdivisions, as the orders are more or less rich. Vignola makes the *entablature* a quarter of the height of the whole column, in all the orders.

In the Tuscan and Doric, the architrave, frize, and cornice, are all of the same height; in the Ionic, Corinthian, and Composite, the whole *entablature* being fifteen parts, five of them are allowed for the architrave, four for the frize, and six for the cornice. See *IONIC*, *CORINTHIAN*, &c. and *COLUMN*.

ENTABLATURE, or **ENTABLEMENT**, is sometimes also used for the last row of stones on the top of the wall of a building, wherein the timber and covering rest.

As this is frequently made to project beyond the naked

of the wall to carry off the rain, some authors call it in *Latine, pinnulum, or drip*. Such an *entallure* does not stand out far enough; it lets the water fall on the foot of the wall.

ENTABLER, in the *Manège*, is said of a horse whose croupe goes before his shoulders, in working upon reins; for, in the regular manege, one half of the shoulders ought to go before the croupe. Thus we say, your horse *entables*; for, in working in the right, he has an inclination to throw himself upon the right heel; which fault you may prevent, by taking hold of the right rein, keeping your right leg near, and removing your left leg as far as the horse's shoulder. A horse cannot commit this fault without committing that called *ACCLER*; but a *tailer* may be without *entabler*.

ENTAIL, in *Law*, signifies *PER TAIL*, or *for entailed*, that is, abridged, curtailed, or limited to certain conditions. For the docking of an *entail*, see *Docking* and *RECOVERY*.

ENTAIL, in the *Materia Medica*, a name given by some authors to foliæ alium.

ENTAILIUM, the *pipe-shell*, in the *Materia Medica*, a shell of the same genus with the *Amulius*, being a species of the *reishi marini*. It is frequent in the East Indies, and sometimes is found on our own shores. The virtues ascribed to it are the same with those of the *amulius*; but neither of them have any title to more than those of alkaline substances, like the other tellaceous powders.

ENTASIS, *Entasis*, from *εν* and *τασις*, *I stretch*, a word used in various senses, by different authors in *Medicine*, but by most applied to the parts of generation; and these *entasis* were medicines, in whatever form, meant as provocatives.

ENTE, in *Heraldry*, literally implies *entersaid*, and is used by foreign heralds to express a method of marshalling, little known among us; yet we have an instance of it in the fourth grand quarter of his majesty's royal ensign, whose blazon is *Cruswick and Lundenburgh, impaled with ancient Saxony, cut in point*.

ENTELECHIA, *ἐντελέχεια*, of *ἐντελής*, *perfect*, a Greek term, by which Aristotle defines the soul, and which, not occurring in any other author, has given the critics and philosophers infinite perplexity to discover its true meaning. See *Soul*.

Hermolaus Barbarus is even said to have consulted the devil about it; after which, in his paraphrase on Theophrastus, by which Aristotle defines the soul, we know not, he renders it by *perfectibilia*, which is not a whit the clearer.

Cicero, whose interpretation should be preferable to that of any modern, defines *entelechia* (*Tusc. Quæst. lib. i. cap. 1*) to be, *a certain, continued, and perpetual motion*; whence it should seem, that Aristotle took the soul for the mode of the body; a continuous motion being, doubtless, a mode of body.

The common Peripatetics hold *entelechia* to signify *soul*, and under it suppose the form of the compound or animal to be understood.

Lastly, others, and those the latest Peripatetics, agree, that the *act*, or *entelechia*, whereby Aristotle meant to explain the nature of the soul, is either some mode of the body, as motion, or it is nothing.

ENTEMENT, in *Law*. See *INTERMENT*.

To ENTER a Hawk, among *Sportsmen*, is used of a hawk when he begins to kill.

To ENTER a Hawk. See *ENTRANCE of hounds*.

ENTERADENES, of *εντερον*, *intestine*, and *αδεν*, *gland*, in *Anatomy*, a name by which many authors have called the intestinal glands.

ENTERENCHYÆ, of *εντερον*, *the viscera*, and *ενχυον*, *I infuse*, in *Medicine*, a name given by authors to the several instruments contrived for throwing clysters into the bowels; such as the bladder and pipe, the syringe, and the like, for liquid clysters; and the box with the double pipe for conveying the smoke of tobacco. See *CLYSTER*, and *PURGATOR*.

ENTERERING, in the *Manège*. See *CUTTING*.

ENTERMEW. See *FACON*.

ENTEROCÆLE, in *Medicine*, a rupture, or descent of the intestines.

The word is formed of *εντερον*, *intestine*, and *κατα*, *down*.

The *enterocæle* is a kind of hernia, or rupture, wherein the intestines, and particularly the ilium, fall either into the groin or the scrotum. See *HERNIA*.

There are two kinds of *enterocæle*; the *perfect*, which happens when the intestine falls into the scrotum; and the *imperfect*, when it only falls into the groin.

The next cause of the *enterocæle* is, the relaxation, or extension of the lower part of the peritonæum, wherein the intestines are contained. The remote causes are, great lifts, too violent exercises, great coughs, frequent

vomiting, much crying, &c. whence it is that children are much subject to it. The remedy is chiefly by external applications, as truffles and belladonna.

ENTERO-EPITOCÆLE, a kind of rupture, wherein the intestines, and *epiploon* or *cail*, fall together into the *scrotum*. See *HERNIA*. The causes are the same as those of the *ENTEROCÆLE*.

ENTERO-EPIPILOPHALUS, a kind of exomphalus, wherein the intestines, and *epiploon* or *cail*, launch out at the navel.

The word is composed of *εντερον*, *intestine*, *επιπλον*, *cail*, and *φαλος*, *umbilicus*, *navel*.

ENTERO-HYDROMPHALUS, in *Medicine*, a kind of exomphalus, wherein, beside a displacing and bursting out of the intestine, there is a quantity of watery humours collected along with it.

The word is formed of the Greek, *εντερον*, *intestine*, *υδωρ*, *water*, and *φαλος*, *navel*.

ENTEROLOGY, (from *εντερον*, *intestinum*, *a gut*, and *λογια*, *forma*, *discourse*) is properly a treatise of the bowels. Though the word is generally understood to include the contents of three cavities, head, breast, and all the viscera or belly.

ENTEROMPHALUS, *επιομφαλος*, in *Medicine*, a kind of exomphalus, wherein the intestines, being fallen out of their place, occasion a tumor in the navel. See *EXOMPHALUS* and *HERNIA*.

The word is formed of the Greek, *εντερον*, *intestine*, and *φαλος*, *umbilicus*.

ENTERORAPHY, of *εντερον* and *ρην*, *suture*, in *Surgery*, a name given to the sutures of the intestines.

To ENTERPEN, in *Falconry*, is a term applied to a hawk, when her feathers are wrapped up, tangled or entangled.

ENTERPLEADER, in *Law*, the disqualifying or trying of a point incidentally falling out before the principal cause can be determined.

Thus, two persons being bound heirs to land by two several offices in one county, the king is brought in doubt to which of them livery ought to be made. Before livery, therefore, they must *enterplead*, that is formally try between themselves which is the right heir.

ENTERPRISE, denotes an undertaking attended with some difficulty and danger: in the *Military art*, this kind of service is assigned to the light-infantry, light-horse, and hussars.

ENTERMENT, or **INTERMENT**. See **INTERMENT**.

ENTERSOLE. See **MEZANINE**.

ENTERTAINMENTS, *epulae*, among the ancients, were of various kinds, as 1. *Funeral entertainments*, *epula funebres*. 2. *Entertainments* given by the husband on bringing home his wife, called *epulae nuptiales*. 3. Those bestowed on the soldiers called *epulae militares*, which was done before or after an engagement, or on occasion of proclaiming the general imperator. 4. *Birth-day entertainments*, *epula natalitiae*.

There were many other kinds, denominated either from the place where, the persons by whom, or the occasion for which they were given.

INTERVIEW, in *Falconry*, a term used for the second year of a hawk's age.

ENTHALIUM, in *Natural History*, a name given by some to a species of the *tubuli marini*, more usually known by the name of *pencilum marinum*, and *pinnæ de mer*.

See **PENCILLI MARINI**.

ENTHEMATATA, from *ενθεμα*, *I put in*, in *Medicine*, a word used to express such oedemata as were immediately put into large fresh wounds to stop the hæmorrhage, and prevent inflammation, or other bad consequences.

ENTHETOS, from *ενθετος*, in the writings of the old *Physicians*, a name given to certain apoplexies intended to be thrust up the nostrils to stop hæmorrhages.

ENTHUSIASM, *ἐνθουσιασμος*, a poetic, or prophetic rage or fury, which transports the mind, inflames and raises the imagination, and makes it conceive and express things extraordinary and surprising.

The word is derived from the Greek, *ενθος*, or *ενθος*, a man animated in an extraordinary manner with the spirit of God; in whom God is, or whom God animates.

Whence the verb *ενθουσιάζω*, or *enthusiast*, and the noun *ἐνθουσιασμός*, *enthusiasm*, and *ενθουσιάζω*, *enthusiasm*, a passion subject to such transports.

M. de Piles defines *enthusiasm* to be a transport of the mind, whereby it is led to think and imagine things in a sublime, surprising, yet probable manner.

The sublime he thinks a necessary ingredient in the definition, as being the proper effect and production of *enthusiasm*.

This is the *enthusiasm* felt in poetry, oratory, music, painting, sculpture, &c. but this *enthusiasm* which belongs to the works of art, is very different from that attributed to the fables and priestesses of the oracles, and

heaven gods, which was little else but fanaticism, and consisted principally in grimace, and contortions of the body. See ORACLE and PYTHIAS.

There is a degree of assent, says Mr. Locke, which, with some men, has the same authority as either faith or reason; and that is *enthusiasm*, which, laying by reason, would set up revelation without it; whereby, in effect, it takes away both reason and revelation, and substitutes in the room of it the ungrounded fancies of a man's own brain, and assumes them for a foundation, both of opinion and conduct.

Immediate revelation being a much easier way for men to establish their opinions, and regulate their conduct by than the tedious labour of strict reasoning; it is no wonder, that some have been very apt to pretend to it; especially in such of their actions and opinions as they cannot account for by the ordinary methods of knowledge and principles of reason. Hence we see, that in all ages men in whom melancholy has mixed with devotion, or whose conceit of themselves has raised them into an opinion of a greater familiarity with God than is allowed others, have often flattered themselves with the persuasion of an immediate intercourse with the Deity, and frequent communication with the Divine Spirit.

Their minds being thus prepared, whatever groundless opinion comes to settle itself strongly upon their fancies, is an illumination from the spirit of God; and, whatever old action they find in themselves an inclination to do, that impulse is concluded to be a call or direction from heaven; and must be obeyed.

This we take to be properly *enthusiasm*, which, though rising from the conceit of a warm or over-heated brain, works where it once gets footing, more powerfully on the passions and actions of men than either reason or revelation, or both together; men being most forwardly obedient to the impulses they receive from themselves.

When men are once got into this way of immediate revelation, illumination without search, and certainty without proof, reason is lost upon them; they are above it; they feel the light infused into their understanding, and they cannot be mistaken: like the light of bright sun-shine, it shews itself, and needs no other proof but its own evidence; they feel the hand of God moving them within, and the impulses of the spirit, and cannot be mistaken in what they feel. But, of this seeing and feeling, is it a perception of an inclination to do something, or of the Spirit of God moving that inclination? there are two very different perceptions, and should be carefully distinguished.

If they know the thing to be a truth, they must do it, either by its own self-evidence, or by the rational proofs that make it out to be so; if they know it to be a truth, either of these two ways, they in vain suppose it to be a revelation; for thus, all truths, of what kind soever, which men uninspired are enlightened with, come into their minds. If they say, they know it to be true, because it is a revelation from God, the reason is good; but then it will be demanded, how they know it to be a revelation from God? if they say, by the light it brings with it, they should consider, whether this be saying any more than that it is a revelation, because they believe it to be true; for all the light they speak of is but a strong persuasion of their own minds that it is a truth, which is a very unsafe ground to proceed on, either in our tenets or actions. True light in the mind, is nothing else but the evidence of the truth of any proposition; and if it be not self-evident, all the light it can have is from the clearness of those proofs upon which it is received. See EVIDENCE.

God, when he makes the prophet, does not unmake the man; he leaves his faculties in their natural state, to enable him to judge of his inspirations, whether they be of divine original or not. If he would have us assent to the truth of any proposition, he either evidences that truth by the usual methods of natural reason, or else makes it known to be a truth which he would have us assent to by his authority; and convinces us that it is from him, by some marks which reason cannot be mistaken in. Essay on Hum. Underst. book iv. chap. 19.

The holy men of old, who had revelations from God, had something else besides internal light, of assurance in their own minds, to testify to them that it was from God; they had outward signs to convince them of the Authority of those revelations: and when they were to convince others, they had a power given them to justify the truth of their commission from heaven: and, by visible signs, to assert the Divine authority of the message they were sent with. Moses saw the bush burning without being consumed, and heard a voice out of it. God, by another miracle, of his rod turned into a serpent, assured him likewise of a power to testify his mission, by

the same miracle repeated before those to whom he was sent.

Devotion, undirected and unrestrained by reason, degenerates into *enthusiasm*, or a religious phrensy, founded in an apprehension of a present Divine energy on the mind, to which all its powers are (supposed to be) subject, and by which a person is carried on, without attention to any thing else as his guide, and producing not only great perturbation of mind, but most amazing agitations of body. Many instances of this kind occur, both in ancient and modern times, to the disgrace and injury of rational religion.

ENTHUSIAST, *Enthusias*, a person possessed with *enthusiasm*. See ENTHUSIASM, FANATIC, &c.

The word is usually understood in an ill sense. It was applied by the ancients to a sect of heretics, called also *Mossalians* and *Euchites*; who, as Theophrastus expresses it, were denominated *enthusiasts*, because, being possessed by the devil, they believed themselves divinely inspired. See MARSALIANI and EUCHITES.

Among us, *enthusiasm* is sometimes of like import with *fanatic*, and is applied to the Quakers and ancient Anabaptists, and modern prophets, from their pretences to extraordinary lights, revelations, visions, impulses, &c. from heaven.

ENTHYMEME, in *Logic* and *Rhetoric*, an argument consisting only of two propositions, an antecedent, and a consequent deduced from it.

The word is Greek, *enthymeme*, formed of the verb *enthymemai*, to think, conceive, a compound of *en* and *thymos*, mind.

Aristotle calls it the *rhetorical or probable argument*; the schools, the *imperfect syllogism*, in contradistinction to the perfect, which consists of three propositions, and is called the *dialectical argument*.

It must be observed, however, that the *enthymeme* is really a perfect syllogism in the mind, and only imperfect in the expression, because one of the premises is suppressed, as being sufficiently clear and obvious, and easily supplied by the understanding of those with whom we discourse. Thus, in every right-lined triangle, the three angles are equal to two right ones; and consequently, they are so in an isosceles triangle, is an *enthymeme*; the proposition, that an isosceles triangle is a right-lined triangle being omitted, as being sufficiently known and granted.

The *enthymeme* is the most simple and elegant of all argumentations; being what a man, in arguing closely, commonly makes, without attending at all to the form. Thus, that verse remaining of Ovid's tragedy, intitled, *Medea*, contains an *enthymeme*: *Scenarii patet, puerum abire regem: I tunc abire facerem, ut consequenter, to have distressed you.* All the beauty would have been lost, had all the propositions been expressed; the mind is displeased with a rehearsal of what is no way necessary. Sometimes, also, the two propositions of an *enthymeme* are both included in a single proposition, which Aristotle calls an *enthymematic sentence*, and gives this instance thereof: *Mortal, do not bear an immortal hatred.* The whole *enthymeme* would be, *Thou art mortal; let not, therefore, thy hatred be immortal.*

ENTIER, in the *Mange*, is used for a sort of testy horse, that refuses to turn, and is so far from following or observing the hand, that he resists it. If your horse is *entier*, and refuses to turn to what hand you will, provided he flies, or parts from the heels, you have a remedy; by putting the Newcaille on him; that is a cavesson, made after the duke of Newcastle's way.

The word is French, and is also used among them to denote a stone-horse.

ENTIERTE, from the French, *entier*, is used in our Law-books, in contradistinction to *entire*, and denotes the whole. Thus a bond, damages, &c. are said to be *entier*, when they cannot be divided or apportioned.

ENTIRE TENANCY, in Law, is contradistinguished to *several tenancy*, and signifies a sole possession in one man; whereas the other denotes a joint, or common one, in several. See TENANT and JOINT-TENANT.

ENTIRE ARMY. See ARMS.

ENTITATIVELY, *ENTITATIVE*, implies an abstraction, or separation, of all the circumstances, from a thing under consideration.

Thus, a thing is said to be taken or considered *entitatively*, or *secundum entitatem*, when considered nakedly and precisely, according to what it is in itself, without any thing extrinsic. E. gr. Peter *entitatively* taken, is Peter, as a thing, a substance, a man, &c. without any regard to his being a lord, a husband, learned, &c.

ENTITY, in the *School philosophy*, a physical ens, or being, considered according to what it is in its natural capacity.

Some dealers in distinctions give us several kinds of *entity*.

Or, *entity* denotes the actual essence or existence of any thing. *See* *Ess.*

ENTORSES, in the *Manège*. *See* *PASTERN.*

ENTOYER, or *ENTOYER*, in *Herakly*, is used to express a *hennere*, charged entirely with things without life. *See* *BOUQUET.*

ENTRAILS, the intestines or guts of an animal. *See* *INTESTINA.*

Ménage derives the word from the barbarous Latin, *intestina*, formed of the Greek, *entron*, *intestine*.

ENTRAILS, is also used, in a more extensive sense, for the viscera, or all the parts contained in the cavities of the bodies of animals. *See* *VISCERA.*

The *aruspex* of the ancients was employed in considering the *entrails* of victims; as the heart, lungs, liver, &c. *See* *ARUSPICES*, &c.

ENTRANCE, in *Sea-language*, is a name often given to the foremast part of a ship under the surface of the sea.

ENTRANCE of hounds, a phrase used by our *Sportsmen*, to express the introduction of these creatures in the art of hunting. They are said to be entered when they are thoroughly taught this.

The time of entering of hounds, is, when they are seventeen or eighteen months old; they are then to be taught to take the water and swim; they are to be laid abroad in the heat of the day, to enure them to fatigue and exercise; and they must be frequently led through flocks of sheep, and warrens, to use them to be under command, and to know that they are to run at nothing but what the huntsman orders. They must be carefully instructed each to know his own name, and to understand the voice of the huntsman, and the notes of the horn used in hunting; and finally, to use their own language in a proper manner.

The best time of entering them is about noon; and it should be in a fair warm day; for, if they be entered in the morning, they will give out when the heat of the middle of the day comes on. Take the most advanced, that the game may not stand long before them, and let them be well rewarded when all is over. This ought to be repeated at least once a week, for two months successively; by this means they will be so fitted and seasoned with what game you may enter them at, that they will never afterwards leave off the pursuit. The new hounds should always be entered with the best and staunchest hounds that can be had; and there is not to be one barking dog suffered in the field on this occasion.

Whatever chase the hounds are intended for, the hare is the best game to enter them at, because, in this chase, they will learn all the turns and doubles that they can possibly meet with in any other kind, and how to come to the holt. They will learn also from this chase, to have a perfect and nice scent, and hard feet, by being used to highways, beaten paths, and dry hills. The hounds, when first entered, must have all the advantages given them that can be. When the hare is put up, from her form, it must be observed which way she went, and the scent must be left to cool a while, and then they must be laid in, and helped as much as can be, by wind, view, holt, or picking the passage; nor will it be amiss, for the first time, to give them a hare tired the same morning in her course.

Some are of opinion, that the best way to enter young hounds, is, to take a live hare, and trail her upon the ground, sometimes one way, and sometimes another, and then to draw her off to a convenient distance, and hide her, that the dogs, taking the scent, may follow all the traces through which she was drawn, and at length find her.

The huntsman ought very well to understand the nature and disposition of his hounds, in finding out the game; for some hounds are of that temper, that when they have found the scent, they will run forward with it, not making any noise, nor show of the tail; others, when they have found a bead, will show the game; and some, having found the footings of the beast, will prick up their ears a little, and either bark, or only wag their ears, or the hinder part of their bodies. This difference of natural disposition the huntsman is particularly to observe in the young and newly entered pack, otherwise he will never understand them, nor ever be able to hunt them to any credit or advantage.

For entering the hound at hart or buck, he should be in the prime of grease, for then he cannot stand up, or hold the chase so long. The forest pitched upon should have all the relays at equal distances, as nearly as may be; but then the young hounds should always have some old staunch ones to enter them, and they should be led to the farthest and last relay, and the hart or buck should be hunted to them. Being come up, the old hounds should be uncoupled; and when they have found the hart, and

well entered the cry, then the young ones are to be uncoupled also; and if any of them are found to lag behind, they must be whipped and beaten forward.

In whatever place the hart is killed, the neck should be immediately flayed, and the hounds rewarded. It is held always to do this while the flesh is hot. There is a very good method of entering hounds at the hart, is to take one in the tails or nets, and wound one of the legs, so as to disable him from running, either very far, or very far; then let him loose, and first let a blood-hound trace the creature, then let loose all the young hounds; and when they have run down the animal, reward them with the neck.

Some enter their hounds within a toll; but this is a bad way; for the hart being in this case always in the net, and not able to run an end, makes a great number of circles and turnings; this is very different from the chase, they are to meet with afterwards; and when they have shot run in the common way, straight forward, and out of sight, they will leave the chase, so unlike that by which they were taught.

ENTRAVES, *entraves*, in the *Manège*. *See* *LOCKS.*

ENTREPAS, in the *Manège*, is a broken pace, or going, properly a broken amble, that is neither walk nor trot, but has somewhat of an amble. This is the pace, or goit, of such horses as have no reins or bridle, and go upon their shoulders, or of such as are spoiled in their limbs.

ENTRICHOMA, from *en* and *trichos*, hair, in *Anatomy*, the name of the outer edge of the eyelid, on which the hairs grow.

ENTRIES, amongst *Hunters*, those places in thickets through which deer are found lately to have passed; by means whereof their blains or face is guessed at; and at which the hounds or beagles are put to them for the view.

ENTRIES, *books of*, in *Law*, are ancient and modern, and contain transcripts of proceedings that have been had in some particular actions: the principal of such are necessary for gentlemen educated to the profession of the law.

ENTRING a ship, in the *Sea-language*, the same with boarding her. *See* *BOARDING.*

ENTRING-ladder, in a ship, is of two sorts; one is used by the ships sides, in a harbour, or in fair weather, for persons to go in and out of the ship; the other is made of ropes, with small thaves for steps, and is hung out of the galley to enter into the boat, or to come aboard the ship from thence, when the sea runs so high that they dare not bring the boat to the ship's side, for fear of flaving her. *See* *GANG-WAY.*

ENTRING-ropes, in a ship. *See* *ROPE.*

ENTROCHUS, in *Natural History*, the name of a genus of fossils of a very regular figure and structure, supported by many authors to be *Lapides sui generis*, and stones in their native state. They are, however, in reality, the fossil remains of some marine animal, probably either of the echinus, or of the star-fish kind, filled like the fossil species of the echini, with a plated spar. Our imperfect knowledge in the animal history has not yet been able to ascertain to what creature they really belong; but their analogy, with the other animal remains, found in the fossil world, plainly evince, that they are of that origin. They are cylindric columns, usually about an inch in length, and are made up of a number of round joints, like so many small wheels or segments of cylinders. These joints, when found separate, and naturally loose, as they sometimes are, are called *trachites*. They are all striated, from the centre to the circumference, and have a cavity in the middle, which is sometimes found empty, but more frequently filled up with various matter, of the nature of the stratum, in which they have lain, or of other of the native fossil substances.

The *entrachi* are composed of the same sort of plated spar with the *astery*, and the spines and shells of the fossil echini; and this is in these usually of a bluish grey colour, and very bright and glossy, when fresh broken. They are subject to accidental injuries, like the other *entrachites*, which have been formed in animal moulds, and are frequently met with, compressed, or crooked. *See* *TRACHITA*, and *Tab. III. Fossils. Cl. 10.*

That the *entrachi* are of marine origin, is evident from this, that they have not unfrequently sea-shells found adhering to them; and when these are broken off, there remain on the *entrachi* no deficiencies, but the shells themselves shew that they have been formed upon, and have grown to the *entrachi*, there being always natural hollows in them to answer to that part of the *entrachi* from which they have been separated; whence it appears very plainly, that these *entrachi*, however altered since in their substance, were, however, existing in their present

fest shape, in those very seas where these shells had their growth.

There are not unfrequently found among the *entruis*, larger or smaller fragments of plated bodies.

We meet with the *entruis* of all the fishes, from that of a pin's head to a finger's length, and the thickness of one's middle finger. They are, in some places, found loose upon ploughed lands; in others, they are lodged in great quantities in the strata of clay, and very often in pieces of different kinds, and different hardness. The *entruis* of Marble is extremely full of them, and owes its beauty, when polished, principally to them. Hill's *Hist. of Foss.* p. 653. Phil. Trans. N° 100. See SPAR, BALENITES, OSTRACITES, &c.

ENTROCHUS, *afferis*, in *Natural History*, the name given by authors, to a peculiar kind of *ASTROCHUS*, differing from the common kind, in having a stellate cavity instead of a round one, in its centre.

ENTROCHUS, *pyramidalis*, a name given by some of the writers in *Natural History*, to the ortho-cerasites, or tubular marines conchures, a species of shell-fish, not known to us in its recent state, but very common in the strata brought over from Sweden for pavements.—Klein. de Tubul. Mar. p. 7. See TUBULI conchuranti.

ENTROCHUS, *rangetis*, in *Natural History*, the name of a fossil body, the several parts of which resemble the *entruis*; but as they are joined together in this body, when perfect, they show themselves in their proper light, and a sight of them in this state is sufficient to explode the opinion advanced by some persons, of the *entruis* being of a vegetable nature; or, as they have pleased to call them, *sea-plants*. This fossil has evidently once been a *stellato-cerasite*, or *sea star-fish*, consisting of twenty rays at the extremity of the body. The manner of insertion of these has been this: the body is of a pentagonal figure, and from this there have arisen five rays; these, at their extremity, have been divaricated, each into two, so as to make the number ten in the second progression; and each of these last being again divaricated into two at its extremity; the third and last progression is of twenty rays. All this is easily distinguishable in the fossil, when perfect, and seems to have been the whole figure of the animal while living. The prototype, or living animal, however, is not found; but this is not an accident peculiar to this fossil, the *cornua ammonis*, and *concha ammonis*, with many other bodies that have been once evidently shell-fish, being no where at this time found in their recent state, though so very numerous in the fossil world. This remarkable fossil star-fish is the body called by some authors, *lithum lapideum*. Keppeler's *Epist.* ad Klein de *Entrochis*.

ENTROCHUS, *radix*, in *Natural History*. See RADIX.

ENTRUSION, or **INTRUSION**, in *Law*, denotes a violent or unlawful entrance into lands or tenements void of a possessor, by a person who has no right to them.

Thus, when a man steps into lands, the owner whereof lately died, before the right heir, either by himself, or any other, hath taken possession, it is *entrusion*.

Entrusion and *abatement* are sometimes taken for the same thing, though there is a difference. See ABATEMENT, in *Law*.

ENTRUSION, in the *Common Law*. See INTRUSION.

ENTRY, or **ENTRANCE**, in its general sense, denotes a door, gate, passage, &c. through which to enter, or arrive within a place.

ENTRY, in *Book-keeping*. See BOOK-KEEPING.

ENTRY, *bill of*. See BILL.

ENTRY, is sometimes also used to denote a duty or impost laid on commodities imported into a state, either by land or sea.

The duties of *entry*, or importation, are paid according to a tariff settled for that purpose. Where the duty of *entry* of any commodity is not fixed by the tariff, it is paid by estimation, i. e. in proportion to what some other commodity of nearly the same quality and value ought to pay. In making *entris* inward, it is usual for merchants to include all the goods they have on board the same ship in one bill, though sometimes there may happen to be upwards of twenty different kinds; and in case the goods are short entered, additional or port *entris* are now allowed; though formerly the goods so entered were forfeited. As to bills of *entry* outwards, or including goods to be exported, upon delivering them, and paying the customs, you will receive a *cocket*, which testifies your payment thereof, and of all duties for such goods. If several sorts of goods are exported at once, of which some are free, and others pay customs, the exporter must have two *cockets*, and therefore must make two *entris*. *Entris* of goods, on which a *DRAW-BACK* is allowed, must likewise contain the name of the ship in which the goods were imported, the importer's name, and time of *entry* inwards. The *entry*

being thus made, and an oath taken, that the customs for those goods were paid as the law directs, you must carry it to the collector and comptroller, or their deputies; who, after examining their books, will grant a *warrant*, which must be given to the surveyor, searcher, or land-writer, that they may certify the quantity of goods, after which the certificate must be brought back to the collector and comptroller, or their deputies, and oath made, that the said goods are really shipped, and not landed again in any part of Great Britain. See DUTY, IMPORTATION, and EXPORTATION.

ENTRY, also denotes a solemn reception, or a ceremony performed by kings, princes, ambassadors, legates, &c. upon their first entering a city, or their return in triumph from some expedition.

ENTRY, in *Law*, signifies also the taking possession of lands or tenements, in virtue of a title thereto. See POSSESSION.

ENTRY, *frankle*. See FORCIBLE.

ENTRY, is also used for a writ which grants possession of lands or tenements to a person, on account of a legal right thereto.

Writ of entry, says Briton, favour much of the right of property: hence, e. g. *are to recover customs and services*; and in these are contained the two words, *give and deliver*. Such are the writs, *quodammodo assisio*, *rationabili assisio*, &c. In the *first* of *entry*, there are three degrees: the first, where a man demandeth lands or tenements of his own feign, after the term is expired. The second, where one demandeth lands or tenements left by another, after the term is expired. The third, where one demandeth lands or tenements of that tenant who had entry by one to whom *feign* ancestor of the plaintiff did left for a term now expired; and according to these degrees, the writs for remedy are varied. Beside which, there is a fourth form, without degree, and in case of a more remote feign, to which the other three degrees do not extend.

The writ in the second degree is called a *writ of entry in the first*. In the third, in *the per* & *the*. And in the fourth, without degree, a *writ of entry in the first*; that is, after *diffusion*, made by each one to each one. The words, *in the per*, *in the per* & *the*, and *in the per*, denote the different forms of this writ, applied to the case upon which it is brought, and each form taking its name from the words contained in the writ. There are five things which put the *writ of entry* out of the degrees, viz. *intestation*, as when the diffisor dies feignly, and a stranger enters; *diffusion* upon *diffusion*, when the diffisor is diffused by another; *feignation*, when the feignella in office or religious profession enters; judgement, when a person recovers against the diffisor; and *release*, when the diffisor dies without heir, or commits felony, &c. on which account the lord enters. There are several other writs of *entry*: See *CASE*, *confessio*, *CASE*, *provisio*, *Commons LEGEM*, *AD terminum*, *SINE assisio*, *assisio*. If a writ of *entry* be conceived out of the right case, so that one form is brought for another, it is *abatable*.

A writ of *entry* differs from an *assise*, in that it lies for the *right* part against him who covered lawfully, but holdeth against law; whereas an *assise* lies against him who unlawfully dispossessed; yet, sometimes, a writ of *entry* lieth upon an *entrusion*. See ASSISE.

ENTYPOISIS, from *entypo*, I made an impression, in Anatomy, the articulation of the shoulder with the arm.

ENVELOPE, in *Fortification*, denotes a mount of earth, sometimes raised in the ditch of a place, and sometimes beyond it, being either in form of a simple parapet, or of a small rampart bordered with a parapet.

These *envelopes* are made where weak places are only to be covered with single lines, without advancing towards the field, which cannot be done but by works which require a great deal of room; such as horn-works, half-moons, &c. *Envelopes* are sometimes called *flank*, *entregardi*, *enfermes*, *lanettes*, &c.

ENVIRONNE, in the *French Heraldry*, is when a lion or other figure is *environed*, or encompassed round with other things. *Environne* with many *bezants*, &c. in orle.

ENULA, in *Botany*. See ELECAMPANE.

ENULION, from *en* and *ulon*, the gums, a word used by some Medical Writers for the Bells of the gums.

ENUMERATION, the act of *enumerating*, or counting.

At the time of our Saviour's birth, Augustus Cæsar had commanded an *enumeration* to be made of all the world, or rather of all the people under his empire. Though several able authors are of opinion, that the *CENSUS*, tax, or *enumeration*, mentioned by St Luke, did not extend to the whole empire, but only to the people of Judæa. See Perizonius de *Censu Judaico*, and Berger de *Vitis Militaribus*.

At Rome, it was an usual thing to have an *enumeration* made

made of all the families; the fast of these was under Servius Tullius, when the men amounted to eighty thousand. Pompey and Crassus made another, when they reached to four hundred thousand. That of Caesar did not exceed one hundred thousand; so that the civil wars must have destroyed three hundred thousand Roman citizens. Under Augustus, in the year 725, the Roman citizens throughout the empire were numbered as four millions sixty-three thousand. In the year of Rome 748, the citizens being numbered again, were found four million two hundred and thirty-three thousand. In the year 766, being the last year of Augustus's reign, that prince, together with Tiberius, made another enumeration of the citizens of Rome, when they were found four millions one hundred and thirty-seven thousand persons. Claudius made a new computation in the year of Christ 48, when, as Tacitus relates it, the Roman citizens throughout the whole empire amounted to six millions nine hundred and sixty-four thousand; though others represent the number as considerably greater. A very rare, yet indisputable mental of Claudius, never yet applied, expresses the precise number in this list made by Claudius, which was called *sestus*, to be seven millions of people fit to bear arms, beside all the soldiers on foot in the armies, which amounted to fifty legions, fifty-seven cohorts, and sixty soldiers. After this enumeration, we find no more till that of Vespasian, which was the last.

ENUMERATION, in *Rhetoric*, denotes a part of the oration, wherein the orator, collecting the scattered heads of what has been delivered throughout the whole, makes a brief and awful rehearsal or recapitulation thereof. See **APARITHESIS** and **SYNTHESIS**.

ENUMERATION of the parts, in *Rhetoric*, amounts to the same with what we more usually call **DISTRIBUTION**.

ENUNCIATION, a simple expression or declaration of a thing, in terms either of affirmation or denial.

The schoolmen usually distinguish three operations of the understanding; apprehension, *enunciation*, and reasoning.

ENUNCIATION, among *Legisians*, denotes the same as **PROSCRIPTION**.

ENVOIE. See **INVOICE**.

ENVOY, a person deputed, or sent purposely to negotiate some particular affair with a foreign prince or republic.

Those sent from the courts of England, France, &c. to Genoa, the princes of Germany, and other petty princes and states, do not go in quality of ambassadors, but of *envoys*.

Add, that those sent from one great prince or state to another, as from the king of England to the emperor, &c. when the affair they go upon is not very solemn and important, have frequently no other character but that of *envoy*. See **EMBAASSADOR**.

Envoy are either *ordinary* or *extraordinary*.

Both kinds are under the protection of the law of nations, and enjoy all the privileges of ambassadors, only differing from them in this, that the same ceremonies are not performed to them.

The quality of *envoy extraordinary*, Wicquefort observes, is very modern; more modern than that of resident; the ministers invested therewith, at first, took on them most of the airs of ambassadors; but they have since been taught otherwise.

In the year 1639, the court of France made a declaration, that the ceremonies of conducting *envoy extraordinary* to their audience in the king and queen's coaches, with diverse others, should no longer be practised to *envoy*.

S. Justiniani, the first *envoy extraordinary* from Venice, after that regulation, offered to cover in speaking to the king, but it was refused him; and the king of France himself declared, that he did not expect his *envoy extraordinary* at the court of Vienna should be regarded any otherwise than as an ordinary resident. Since this time, those two kinds of ministers have been treated alike. Wicquefort.

ENUR, a word used by some of the *Chemical Writers*, to express the occult, or hidden vapour of waters, of which they suppose flowers to be produced.

ENURE, in *Law*, signifies to take place, or be available, and as much to have effect. Thus for instance, a release made to tenant for life shall *enure*, and be of force and effect to him in the reversion.

ENVY, in *Etymology*, is defined by Mr. Locke, to be an uneasiness of mind, occasioned by the consideration of a good we discover in possession of another person, whom we deem less worthy of it than ourselves. It is a competition of sorrow and hatred, and stands in direct opposition to congratulation. *Envy*, in its nature and effects, is the basest, most antichristian, and most tormenting of all passions.

ENVY, in *Mythology*, is represented by the Greek and Roman poets as an infernal divinity, with squinting eyes, lean body, pale countenance, disturbed air, head encompassed with serpents, &c.

ENURNY, is the herald's term for the bordure of a coat of arms being charged with any kind of beetle.

ENXYLON, of *α and λυον*, *wood*, a name used by the Greek authors for a species of worm or maggot, hatched from the eggs of a beetle, and having its habitation in wood; which, in this state, it creeps and burrows in various directions. The old Greeks call it *αλυσ* and *αλυσ*, and used the pieces of wood crossed with it in remarkable figures, as seals. See **TERRA**.

ENYSTRON, of *α and στρον*, *pasture*, a word used by Aristotle for the second ventricle in ruminating animals, in which the food is elaborated and concocted.

EOLIC, or rather **ÆOLIC**. See **ÆOLIC**.

EOLIPHE. See **ÆOLIPHE**.

EOLUS, and **EOLUS's birds**. See **EOLUS**.

EON, or **ÆON**. See **ÆON**.

Eon, a word used by some anatomical writers to express the whole ambit or compass of the eye.

EONIANs, in *Church History*, the followers of Eon, a wild fanatic of the province of Bretagne, in the twelfth century, whose brain was disordered. He concluded from the resemblance between *εον*, in the form for exorcising malignant spirits, viz. *Per eum, qui ventorum est judicium vivis et mortuis*, and his own name, *Eon*; that he was the son of God, and ordained to judge the quick and dead. Eon, however, was solemnly condemned by the council at Rheims in 1148, at which pope Eugenius III. presided, and ended his days in a miserable prison. He left behind him a number of followers and adherents, whom persecution and death, in weakly and cruelly employed, could not persuade to abandon his cause, or to renounce an absurdity, which, says Mosheim, one would think could never have gained credit but in such a place as Bedlam. Eccl. Hist. vol. ii. p. 458.

EORIA, in *Mythology*, a feast celebrated by the Athenians in honour of Erigonus, who, by way of punishment, for their not avenging the death of his father Leucus, engaged the gods to inflict the curse on their daughters, that they should have men who never returned their passion. The feast was instituted by the order of Apollo.

EOSTRE, in *Mythology*, a Saxon goddess, to whom they sacrificed in the month of April, called the month of *Eostra*; and thence the name **EASTER**, which the Saxons retained after their conversion to Christianity, applying it to the festival celebrated in commemoration of our Saviour's resurrection. Bed. de Rat. Temp. cap. 13.

EPACHTES, *Επαχτης*, in *Astronomy*, a festival celebrated in honour of Ceres, named *Æpion*, from *απχτις* i. e. *grief*, in memory of her sorrow, when she had lost her daughter Proserpine.

EPACTS, in *Chronology*, the excesses of the solar month above the lunar synodical month; and of the solar year above the lunar year of twelve synodical months; or of several solar months above as many synodical months; and several solar years above as many dozen of synodical months.

The *epacts*, then, are either *annales mensuales*.

EPACTS, mensuales, are the excesses of the civil or calendar month above the lunar month.

Suppose, e. gr. it were new-moon on the first day of January; since the lunar month is 29 days, 12^h 44^m 3^s, and the month of January contains 31 days; the mensural *epact* is 1 day 11^h 15^m 57^s.

EPACTS, annales, are the excesses of the solar year above the lunar.

Hence, as the Julian year is 365 days 6^h and the Julian lunar year 354 days 8^h 48^m 38^s, the annual *epact* will be 10 days 21^h 11^m 22^s; that is, nearly 11 days. Consequently, the *epact* of 2 years is 22 days; of 3 years, 33 days; or rather 3, since 30 days make an *embolismos*, or intercalary month. Thus the *epact* of 4 years is 14 days, and so of the rest; and thus, every 19th year, the *epact* becomes 30 or 0; consequently the 19th year the *epact* is 11 again; and so the cycle of *epacts* expires with the golden number or lunar cycle of 19 years, and begins with the same, as in the following table:

Gold. Numb.	Epact.	Gold. Numb.	Epact.	Gold. Numb.	Epact.
1	XI	7	XVII	13	XXIII
2	XXII	8	XXVIII	14	IV
3	III	9	IX	15	XV
4	XIV	10	XX	16	XXVI
5	XXV	11	I	17	VII
6	VI	12	XII	18	XIX
				19	XXX

Again, as the new moons are the same, that is, as they fall on the same day every 19 years, so the difference between the lunar and solar years, is the same every 19 years. And because the said difference is always to be added to the lunar year, in order to adjust or make it equal to the solar year; hence the said difference respectively belonging to each year of the moon's cycle is called the *epact of the said year*, that is, the number to be added to the said year, to make it equal to the solar year, the said being formed from the Greek, *επακτος*, *epaktos*, *into-act*.

Upon this mutual respect between the cycle of the moon and the cycle of the *epact*, is founded this rule for finding the Julian *epact*, belonging to any year of the moon's cycle. Multiply the year given of the moon's cycle into 12, and if the product be less than 30, it is the *epact sought*; if the product be greater than 30, divide it by 30, and the remainder of the dividend is the *epact*. For instance, I would know the *epact* for the year 1712, which is the third year of the moon's cycle. Wherefore 3 is the *epact* for 1712, for $11 \times 3 = 33$, and 33 being divided by 30, there is left 3 of the dividend for the *epact*. But the difference of the Julian and Gregorian years being equal to the excess of the solar above the lunar year, or 11 days, it happens that the Gregorian *epact* for one year is the same with the Julian *epact* for the preceding year.

By the help of the *epact* may be found what day of any month in any year the new moon falls on, thus: to the number of the month, from March inclusively, add the *epact* of the year given; if the sum be less than 30, subtract it out of 30; if greater, subtract it out of 60; and the remainder will be the day whereon the new moon will fall.

If the new moon be sought for in the month of January or March, then nothing is to be added to the *epact*; if for February or April, then only 1 is to be added.

For example: I would know what day of December the new moon was on A. D. 1711, the *epact* whereof is 22. By the aforesaid rule, I find it will be December the 28th; for $22 + 10 = 32$, and $60 - 32 = 28$. See MOON. The day whereon the new moon falls being thus found, it is easy to infer from thence what the age of the moon is on any day given. See MOON.

However, there is a peculiar rule commonly made use of to this purpose, which is this: add the *epact* of the year, the number of the month from March inclusively, and the given day of the month all into one sum; this, if it be less than 30, shows the age of the moon; if it be greater than 30, divide it by 30, and the remainder of the dividend shows the age of the moon, or how many days it is from the last new moon: this method will never err a whole day.

For instance, what was the age of the moon on December 31st, A. D. 1711? By this rule, I find, that the moon was then three days old; that is, it was then three days from the last new moon. For $22 + 10 + 31 = 65$; and 65 being divided by 30, there will remain of the dividend 5. And this exactly agrees to the other foregoing rule, whereby it was found, that the new moon was on December 28, 1711.

It must be observed, that at the time of the general council of Nice in 325, it was thought, that 19 Julian solar years were exactly equal to a cycle of 19 lunar years, or to 235 synodical months; and therefore, that at the end of 19 years, the new moons would happen exactly at the same times as they did 19 years before: but this is a mistake.

days h. m. s.	
For 19 Julian solar years contain	6939 18 0 0
Whereas 235 synodical months contain only	6939 16 31 56 30
And are therefore less than	
19 Julian solar years, by	0 1 28 3 30

Hence it appears, that the cycle of 19 years anticipates the new moons by one day in 310.7 years very nearly; and therefore the same cycle of *epacts* will not always hold; the moon's anticipation lessening the several *epacts* by one every 310.7 years.

To have the *epacts*, therefore, point out the new moons perpetually, that *epact* given in the calendar is not sufficient; but all the 30 *epacts* should be bestowed throughout the whole year, that the calendar may exhibit all the cycles of *epacts*. See a table of this kind in Wolfius's *Elementa Chronologicæ*, apud Opera, tom. iv. p. 133.

It is plain, that whenever the forementioned anticipation takes place, or it becomes necessary to let the golden numbers one day back in the calendar, the *epact* must be increased by an unit more than usual, e. g. 12 must be added instead of 11, to the *epact* of the preceding, in order to form the *epact* of the current year; and thus

the subsequent *epacts*, increasing constantly by 11, will be greater by unit than the corresponding *epacts* of the preceding 19 years. If the *epacts* were once properly prefixed in the calendar, to denote the days on which the new moons fall in those years, of which those numbers are the *epacts*, they might remain in the calendar without shifting their places; since the augmentation of each *epact* by an unit extraordinary would answer the purpose, and preserve the Julian account tolerably exact. But the Gregorian account is not so easily adjusted; for it will require more consideration to determine, when the *epacts* are to be more than ordinarily augmented, and at what times they are to continue in their usual course; nay, to know when they are to be diminished by an unit, which will most commonly be the case; because, in every Gregorian solar year, consisting of any number of minor centuries not divisible by four, the equinox is supposed to have anticipated one whole day; and therefore the bissextile, or intercalary day is omitted; consequently the preceding solar year, where one day was lost, exceeded the lunar year by 10 days only instead of 11.

Lord Macclesfield has given the following directions for this purpose:

In the years 1800, 2100, 2400, 3000, &c. where the number of centuries is divisible by 3 only, the Gregorian solar, as well as the lunar year, will have lost a day; and consequently the difference between them will be the same as usual; therefore in these years the *epacts* and golden numbers will remain unaltered, the former will go on to the same manner, and the latter stand prefixed to the same days in the calendar, for another century, as they did for the last. The case will be the same in the years 2000, 2800, 3200, &c. where the number of centuries is divisible by 4 only. But in the years 2200, and 3600, whole number of centuries is divisible both by 3 and 4, the Gregorian solar year remains as usual, and the lunar year has lost a day: the difference betwixt them being 12, the *epact* of the preceding year must be augmented by that number instead of 11, in order to form the *epact* of the then present year; and thus a new set of *epacts* will be introduced, each exceeding the precedent corresponding *epacts* by unit; and the golden numbers must be set one day back in the calendar. Again, in the years 1600, 2000, 2400, 2800, &c. where the number of centuries is divisible neither by 3 nor 4, the Gregorian solar year loses one day, and the lunar month; and the difference between them, viz. 10, and not 11, must be added to the *epact* of the preceding for that of the current year; and thus a new set of *epacts* will be introduced, less by unit than their precedent corresponding *epacts*; and the golden numbers must be set a day forwarder in the calendar. By this method the new moon might be pointed out, either by the golden numbers or the *epacts*, placed in the calendar for that purpose; according to the Julian account, for ever, and according to the Gregorian account till the year 4109 inclusive. Phil. Trans. vol. 21st, p. 417. or N° 495. art. v.

Rule for finding the Gregorian *EPACT*.

Divide the centuries of any year by 4; multiply the remainder by 17, and to this product add the quotient multiplied by 43 and the number 86, and divide this whole sum by 25; multiply the golden number by 11, from which product subtract the last quotient and the remainder, rejecting the thirties from it, will be the *epact*.

Example for 1779.

1. $17 \div 4 = 4$ — Rem. 1.
2. $1 \times 17 = 17$.
3. $43 \times 4 + 17 + 86 = 275$.
4. $275 \div 25 = 11$.
5. $11 (G. N.) \times 11 = 121$.
6. $121 - 11 = 110$. And,
7. $110 \div 30 = 3$

leaves a remainder 12 for the *epact* required.

The reason of the operation may be evinced in the following manner.

If the new moons returned exactly at the same time after the expiration of 19 years, the product of the golden number, or year of the lunar cycle, multiplied by 11, would give the Gregorian *epact*; but we have already shewn, that they anticipate a day in 310.7 years, and therefore in a Julian century they must anticipate

$\frac{100}{310.7}$, or nearly $\frac{8}{25}$ of a day; and in a Gregorian common century, which is one day shorter than a Julian century, they happen 1 day $\frac{1}{25}$, or $\frac{12}{25}$ of a day later; and $3 \times \frac{12}{25} = \frac{36}{25}$ of a day in 3 common centuries; but in four Gregorian centuries one of which is bissextile, they

will happen later by $\frac{51}{25} \times \frac{8}{25} = \frac{408}{625}$ of a day; and in this proportion must the *epact* be decreased. At present the Gregorian *epact* is 11 days short of the Julian; but the quotient of the number of centuries divided by 4, which at this time is 4, multiplied (as the rule directs) by $\frac{408}{625}$, with the addition of the remainder 1 multiplied by $\frac{25}{25}$, amounts only to $\frac{169}{25}$, or 7 days $\frac{14}{25}$; therefore, $\frac{89}{25}$ i. e. 3 days $\frac{14}{25}$ must be added to complete the 11 days.

The *epact* may be found till the year 1900, by subtracting one from the golden number, multiplying the remainder by 11, and rejecting the thirties, because the last quotient, mentioned in the foregoing rule, will be always 11 till the year 1900.

In the following table, the golden numbers, with their corresponding *epacts*, till the year 1900, may be seen at our view.

Golden Numb.	Epact.	Golden Numb.	Epact.	Golden Numb.	Epact.	Golden Numb.	Epact.
1	0	XXV	11	XX	10	XV	5
2	XI	VI	12	1	17	XXVI	16
3	XXII	8	XXIII	13	XII	18	VII
4	III	9	XXVIII	14	XXIII	19	XVIII
5	XIV	10	IX	15	IV		

To find Easter by the *epact*, see EASTER.

To find the moon's age by the *epact*, see MOON.

EPAGOMENE. See YEAR, *Epiphan.*
EPANALEPSIS. *Epianalepsis*, called also *EPANADIPLOISIS*, in *Rhetoric*, the repetition of the same word in the beginning of one sentence, and at the end of another. Thus Virgil,

Archa firmata stabili, Arceas ambo.

See ANACIPLOSIS.

EPANAPHORA. *Epianaphora*, in *Rhetoric*, the same with *ANAPHORA*.

EPANASTASIS. from *anastasis*, I cause to rise, a word used by Hippocrates, and others of the old physicians, for a critical tumor or tubercle in certain diseases. Thus Hippocrates observes, that the tumors about the eyes, upon the recovery of the patient, prognosticate death.

EPANASTROPHIE. *Epianastrophe*, in *Rhetoric*, the same with what is elsewhere called *ANADIPLOISIS*.

EPANCYLOTOS. of *anacylos*, wreath, a sort of wreathed bandage; described by Oribasius.

EPANODUS. *Epianodus*, in *Rhetoric*, a repetition of the same words in an inverted order; thus,

Nos brevis nimis, alii nimis brevis max. Voss. Rhet. Lib. v. p. 205.

EPANORTHOSIS. in *Rhetoric*, a figure whereby the orator corrects and corrects something before alleged, as too weak, and adds something stronger and more conformable to the passion he is stirred by.

The word is formed of *epithesis*, right; *orthosis*, whence *epithesis*, I straighten, amend, correct, I redress, straighten, correct, and *orthosis*, amendment. Accordingly the Latins call it *correctio* and *emendatio*.

Such a. gr. is that of Cicero for Cælius: *O stultitia! stultitiamne dæm, an impudentem singularum? Ob folli? folli didi calli, et rather intolerabile impudente? And in the first Cælius: Quoniam quid loquor? Te ut illa res frangat? Tu ut unquam in corrigas? Tu ut unquam super mediter? Tu ut alium scilicet cogitas? Utinam tibi istum mentem ad immortalitatem dæmonem. Thus also Terence, in the *Heautontimorumenos*, introduces his old man Menodæmus, saying,*

Essem unicum adolescentulum habes. At! quid tibi balere me? iam balui, Cælius. Nunc habeam necesse, incertum est.

EPAPHRESIS. from *epi*, denoting repetition, and *phresis*, removal, a term used by Galen, for frequently repeated excursions of the vessels by phlebotomy.

EPARCHUS. *Eparchus*, an officer under the Greek emperors of Constantinople, who had the command of the guards, or government of a province.

EPARER. in the *Manège*, is used to signify the flinging of a horse, or blayking or striking out with his hind legs. In equestrian, a horse must yerk out behind with all his force; but in balletades he strikes but half out; and in croquet he does not strike out his hind legs at all. All horses that yerk are reckoned *rudés*. See *YERKING*.

EPARITA. in the *Matéria Medica*, a name given by Para-

celus to a sort of fine earth, of a liver-colour, seemingly the same with the Tokay hole.

EPARMATA. of *epi*, layers, in *Medicine*, are tumors of the glandules, called *paraty*, behind the ears.

EPARSIS. in the *Medical Writings of the Ancients*, a word sometimes applied indifferently to any tumor, but more usually appropriated to a pustule.

EPAULE. or *EPAUTLE*, in *Fortification*, the shoulder of the bastion, or the angle made by the face and flank, otherwise called the *angle of the epaule*. See *BASTION* and *ANGLE*.

The word is pure French, and literally signifies the shoulder. **EPAULEMENT.** in *Fortification*, a pile-work battery thrown up, to cover the cannon of the mine.

It is made either of earth thrown up, of bags filled with sand or earth, or of gabions, fascines, &c. with a sort of which latter sort the *epaulements* of the places of arms for the cavalry behind the trenches usually are.

EPAULEMENT. is also used for a demi-bastion, consisting of a face and flank, placed at the point of a horn-work, or crown-work. Also for a little flank added to the flank of a horn-work, to defend them when too long. Also for the redoubts made on a right line to fortify it. And lastly, for an orillon, or mass of earth almost square, faced and lined with a wall, and designed to cover the cannon of a casemate. See *BASTION* and *ORILLON*.

EPAULETTES. are a kind of shoulder-knots chosen for the soldiers, which are to be of the colour of the facing, with a narrow yellow or white tape round it, and worked fringe; those for the officers are made of a gold or silver lace, with a rich fringe; they are badges of distinction worn on one or both shoulders. Those of the dragoon-guards, horse, and dragoons, are worn on the left shoulder: the light-dragoons, and officers of grenadiers, have one on each shoulder: those of the battalion wear one on the right shoulder only, which is to be made of embroidery or lace, with a gold or silver fringe. Those of the royal regiment of artillery are to be gold embroidery, with gold fringe on scarlet cloth, and worn on the right shoulder.

EPENBOLE. *Epibolus*, in *Rhetoric*, the same with *PARENBOLE*.

EPENCERANIS. a name by which some of the old authors, particularly Erasistratus, have called the cerebellum.

EPENDYTES. *Ependytes*, among the Greeks, a garment worn under the *paludum*, and above the *intrinse* or inner coat, called in Greek, *ependytes*.

EPENCHESIS. in *Grammar*, the addition, or insertion of a letter or syllable, in the middle of a word; as *triginta* for *triginti*, *Aluani* for *Alui*, *altum* for *altum*. Virg. Æn. lib. vii. ver. 27.

The word is formed of *epi*, and *enchesis*, q. d. *enchesis*, *injectio*, *insertio*.

EPERILANUS. in *Ichthyology*, a name sometimes given, on account of its pearl colour, to the *IMPERIL*.

EPERON. in *Natural History*, the spur-shell, so called from its resembling in some degree the ravel of a spear. It is a species of snail, of the round-smoothed kind, or class of the *echin* *lunaris*; all its valves are furnished with double rows of prickles. See *LUNARI* *caulus*.

EPERVIER. in *Natural History*, a name given by the French authors to a class of butterflies, which make the sixth in Reaumur's method. They have a way of poisoning themselves on the wing in the manner of kites, and other birds of prey; and always live upon the wing, never settling themselves upon the flowers they feed upon, but keep flying with a humming noise like a humble-bee, while they thrust in their trunk and suck the juices of the flower.

EPHA. a dry MEASURE in use among the Hebrews.

The *epha* was the most common measure they used, and that whereby the rest were regulated. It is commonly supposed that the *epha*, reduced to the Roman modius, contained four modii and a half. Now the Roman modius of grain, or flour, contained twenty libras or pounds, consequently the *epha* weighed ninety pounds. Dr. Arbuthnot reduces the *epha* to three pecks three pints, English measure.

EPHETUM. in *Botany*, a name by which some authors have called the renunculus, or crow-foot.

EPHEBAUM. *Ephebaum*, in *Anatomy*, the place where the ephebi or youth exercised; or, as some say, where those who designed to exercise, met, and agreed what kind of exercise they should contend in, and what should be the victor's reward.

EPHEBI. *Ephebi*, among the Athenians, a designation given to their young men when they arrived at eighteen years of age, at which time they had their names entered in a public register. Pott. Archæol. Græc. lib. i. cap. 9. tom. i. p. 28.

EPHEDRA. in *Botany*. See *HORNBILL*.

EPHILLÆUM. in *Anatomy*, is the place from the hypogastrium

gastrum, or lower part of the abdomen, to the secret parts.

EPHELICIS, from *ἐλκω*, *ulcer*, a word used by the ancient Greek Physicians, sometimes for the crust of an ulcer, and sometimes for a small abrasion or bloody fragment, brought up by coughing, in an hæmoptoe.

EPHELIS, from *ἐρι* and *ἥσος*, *sun*, a name used by the ancient writers on *Medicine*, for a disorder of the face, brought on by the sun and drying winds, and of the nature of what we call sun-burning. It was a certain roughness, hardness, and bad colour of the skin.

The *ephele*, or sun-burning, is removed by an application of resin, to which a third part of soft oil, and a little honey are added; but all these disorders, as also the unnatural colour of clearities, are remedied by the following preparation, ascribed to Trypho the elder:

Take equal quantities of myrobolan, crocogona, cinnamon earth of a bluish colour, bitter almonds, the meal of barley and bitter vetch, dyer's weed (*Isatis alba*); all these are to be triturated together, and made up with the most sharp honey. With this preparation the parts affected are to be anointed at night; and the medicine carefully to be washed off the next morning. James Med. Dict. See FRÆCKLEY.

EPHEMERA, in *Medicine*, an epithet applied to some thing that lasts but a day; particularly to a sort of fever, which terminates in the compass of twenty-four hours, called by Galen, *επιεμνησιν*, *fiebris ephemera*, by the Latins, *diaria*. See FEVER.

The word, and the following one, *ephemerides*, are formed of the preposition *ἐν*, *in*, *di*, *day*, and *ἡμέρα*, *day*. Some medical writers express themselves by *ephemera simplex* or *diurnum*. It is, properly, an attempt of nature to ease herself of the load of a plethora, either by an absolute discharge of part of the blood by an hæmorrhage, or by resolving it into serum, and expelling it in that form, the secretory, and excretory motions, being increased beyond their natural degree. The diary fever, properly so called, lasts only twenty-four hours; but this differs in nothing, except the time of its duration, from the *ephemera plurimum diurnum*, which commonly lasts four days. To this it is to be added, that some authors have called the febrile Anglica, *ephemera maligna*, a malignant diary fever, as it generally destroyed the patient in the space of one day.

The simple diary fever usually seizes the patient without any preceding shivering, and immediately is attended with a degree of heat of the flesh, which continues the same without intermission or exacerbation, till the close. This is usually not very violent, and is always attended with pains in the head, sometimes heavy and dull, sometimes pulsative and very acute. Such persons as fall into this fever, from drinking large draughts of cold liquors while they are hot, as is very frequently the case, always have a pain in the right hypochondrium. The face is red and inflamed in this disease, and there is a lassitude and weariness in all the limbs, the pulse is strong and quick, the urine is of a deep orange colour, and deposits a reddish sediment.

This fever usually goes off in a moderate sweat, and sometimes, though less frequently, by a hæmorrhage at the nose. It is over of short duration; for if it exceeds the first day, it is always terminated, at the utmost, on the fourth or fifth. There is either very little, or very bad sleep, during the whole time. The patient oft never closes his eyes at all, or, if he sleeps a little, is never sensible himself that he has slept.

The persons most subject to this fever are young men, who have much blood, and feed heartily; and such as have had any habitual discharge of blood stopped upon them, whether natural, as in the hæmorrhoidal, or menstrual discharges; or artificial, such as frequent bleeding, cupping, and the like: and those who have thrown their blood into violent emotions, by the too free use of spirituous liquors, too violent exercise, unusual watchings, long day by large fires, a sudden repression of sweats by cold water, or by violent passions, particularly anger.

Causæ of it. The principal general causes of this fever, are a plethoric disposition, and a commotion of the blood; the accidental ones are a high diet, and sedentary life, great heat of the body from violent exercise, and from the sun in hot weather; violent sweating, or heating medicines, injudiciously administered; and sudden chilling of the body, when much heated.

Prognosis of it. The simple *ephemera*, when wholly left to itself, is of no danger, if the person be kept warm, and in a state of rest; and all that need be done in common cases, to assist nature in it, is the frequent drinking of warm diluting liquors. When it is improperly treated, or disturbed by a wrong regimen, it often has worse consequences; and, indeed, the doctor often changes this

into an inflammatory or synochal fever, properly so called. It is known, that matters are properly managed, and that nature is taking her due course, if the urine and sweat are properly excreted.

Method of treatment. When the peculiar disposition of the blood, or other accidents, render this fever worse than it naturally should be, the proper course is to attenuate the violent emotions of the blood with nitrous, and the fixed antimonial medicines, and occasionally, with the gentle acids, such as lemon-juice, and the like; and indeed, in all cases of this kind, the frequent use of warm and weak liquors, with lemon-juice among them, is highly to be commended. The free eruption of the sweat, by which nature attempts to ease herself of the disease, is to be promoted by the gentle solutives, nitre, crabs-eyes, and a small quantity of juice of lemon, just enough to satiate the alkali of the crabs-eyes, prove an excellent medicine, to be repeated in small doses every three or four hours; and toward night the sudorifics should be joined to these, such as the contrayerva-root, or the like; and when it is over, there should be given a few doses of some gentle purge, as an infusion of rhubarb andenna, or the like. Bleeding is unnecessary in this fever. Juncker's Comp. Med. p. 264.

EPHEMERA, or **EPHEMERON**, in *Natural History*, a name given by authors to a small fly, called by us the *day-fly*. It is an insect found about the mouths of the Rhine, and some other rivers in Germany, and seems a sort of middle species between the May-fly, common with us and bred from the cadew worm, and the libellæ, or dragon-fly. It has four wings, two long, and two short; two short horns, six legs, and two very long straight hairs issuing from the tail. They are seen flying about the surface of the water about mid-summer, for three days, and no longer; they eat nothing, and their only business is to drop their eggs on the surface of the water, after they have copulated. These eggs, sinking to the bottom, produce a sort of worms, or maggots; these soon hollow themselves cavities in the clay, where they remain three years, growing every year about an inch in length. When the worm is come to its full growth, it rises to the surface of the water about six o'clock in the morning, and there issues from it this fly, which lays its eggs, and dies about six o'clock the same night; so that the life of the creature in the fly-state is only about five hours. Swammerdam, *Hist. Insect.*

Though Swammerdam says, that the life of this creature is no more than five hours, yet his own account plainly shews that it really lives three years; it is certainly as much alive in the worm state as when afterwards it becomes a fly. Baker's Micro. 1743. p. 305.

EPHEMERA, in the Linnean system, makes a distinct genus of the *neuroptera* order, distinguished by two gibbous protuberances above the eyes, erect wings, and bristly tail. He enumerates eleven species of this genus, distinguished by their different colours, and the number of hairs in their tail; some having two, and others three.

EPHEMERA, is also applied among *Botanists*, to a kind of flowers which open and expand themselves at sun-rising, and wither or close up again at his setting. Such are the *Ant. de-lion*, vulgarly dandelion, and diverse others.

EPHEMERIDES, in *Astronomy*, tables calculated by astronomers, shewing the present state of the heavens for every day at noon; that is, the places wherein all the planets are found at that time.

It is from these tables that the eclipses, conjunctions, and aspects of the planets, are determined; horoscopes, or celestial schemes, constructed, &c.

We have *ephemerides* of Origan, Kepler, Argoli, Heckerus, Mezarchialis, Wing, De la Hire, Parker, &c. S. Cassini has calculated *ephemerides* of the sidereal motions, or scintillations of Jupiter, which are of good use in determining the longitude.

In England the Nautical Almanac, or Astronomical Ephemeris, published annually by anticipation, under the direction of the commissioners of Longitude, is the most considerable. See ALMANAC.

In France, celestial *ephemerides* have been published by M. Delplace, every ten years, from 1715 to 1745; and were afterwards continued by the abbé Caille, with many additions; of which an account may be seen in the History of the Academy of Sciences for 1743. The Academy of Sciences have likewise published annually, from the beginning of the present century, a kind of *ephemeris*, under the title of *Cronoïde des Temps*.

EPHEMERUM. See SPIDER-WORM.

EPHESIA, in *Astology*, a feast instituted at Ephesus, in honour of Diana.

EPHESTIA, in *Mythology*, a feast celebrated in honour of Vulcan, in which three young ladies ran for a prize.

EPHESTRIA, were feasts celebrated at Thebes, in honour of Thebes.

EPHESUS, *trough of*. See **DIANA**.

EPHETAE, of *epous*, *I send forth*, in *Antiquity*, a sort of magistrates among the Athenians, instituted by king Demophoon, to take cognizance of murder, manslaughter, and chance-medley.

Their number was one hundred, whereof fifty were Athenians, and fifty Argives: they were not admitted to the post till upwards of fifty years of age. Draco new modelled it, excluded the Argives out of it, and made it to consist of fifty-one Athenians, each above fifty years of age. Ubbel Emmius de Rep. Athen. says, he transferred to them part of the jurisdiction of the Areopagus. See **AREOPAGUS**.

EPHIALTES, of *epi* and *Alteas*, *I leap*. See **INCUBUS**.

EPIDROSIS, from *epidos*, *I push*, in the *Medical Writings of the Ancients*, a word used to express a sweat, sometimes light, and not critical; and at others, a symptomatic one, appearing only on the head, neck, and breast. These are both bad symptoms in many diseases, though they are often followed by the ingenious for good signs, and forwarded by hot medicines, in the destruction of the patient. See **SWEAT** and **SWEATING**.

EPHIPPIA, of *epi* and *hippi*, *horse*, denoted certain cloths or hangings, which were fastened on a horse by a girth or surcingle, in ancient Greece, before the use of saddles were known. They were composed of different materials, as leather, cloth, and the skins of wild beasts, and sometimes adorned with gold, silver, and precious stones. See *Beza's Art of Horsemanship*, vol. i. p. 41.

EPHIPITES. See **HIPOCRATES**.

EPHIPTIUM, *Epipm*, in *Antiquity*, a part of the *EPHONIDES*, called also *folia epina* and *folia turcia*.

EPHOD, *עֶפְדִּין*, derived from *עָפַד*, *aphad*, *to dithy*, a sacerdotal garment, in use among the ancient Jews, supposed to have been a kind of linen alb, or surplice, worn by persons of distinction, of various characters; the same with what the Latins call *ephephimata*.

It is very hard to say precisely what the *ephod* was; and there is room enough for the interpreters to be divided about it. The only point they are agreed upon is, that it was an upper garment worn over all the rest, immediately under the pedicel or breast-plate. Some hold it had sleeves, others deny it. The general agree that it was very short, though some maintain that it hung down to the feet behind.

There were two kinds of *ephod*; the one, common to all who assisted in the temple, being only made of common linen, mentioned in the first book of Samuel, ii. 18; the other, peculiar to the high-priest, mentioned Exod. xxviii. 6, 12, to be made of gold, of blue, and of purple, of scarlet, and fine twined linen, with cunning work; having two shoulder-pieces, with a curious girdle of the same matter, wherewith were two carves, with the names of the children of Israel engraved thereon.

It is also expressed in the second book of Samuel, vi. 14, that upon the removal of the ark of the covenant from the house of Obed-Edom, David danced for joy, girt with a linen *ephod*; whence some authors have concluded, that the *ephod* was also a regal garment, worn on solemn occasions.

EPHORI, *Epouri*, magistrates established in ancient Sparta, to balance and check the power and authority of the kings; as at Rome, there were tribunes created to controul the power of the consuls.

The word is formed of the Greek, *epous*, *intense*, formed of the preposition *epi*, and the verb *epai*, *to sit*, whence *epous*, *to sit upon*, *superior*.

Lycorgus being sensible that a perfect understanding between the prince and the people, was the basis and foundation of both their happiness, to maintain that good understanding, established *ephori*, or inspectors, as a kind of mediators, who should have an eye to the measures and conduct of both sides, and preserve to equal a balance between them, that the regal power should never decline into severity and tyranny, or the liberty of the people run into licence and rebellion.

This is the account of their institution given by Herodotus and Xenophon. Her. lib. i. Xen. de Rep. Lacedæm. The authority of the *ephori* was very great: they presided in popular assemblies, collected their suffrages, declared war, made peace, treated with foreign princes, determined the number of forces that should be raised, appointed the funds to maintain them, and distributed rewards and punishments in the name of the state: they likewise held a court of justice, enquired into the behaviour of all magistrates, inspected the education and conduct of youth, had a particular jurisdiction over the *hoblers*, and by degrees drew the whole administration into their own hands. On certain occasions they expelled, and even put to death the kings; and abolished

or suspended the power of the other magistrates, calling them to account at pleasure. Agellus, in the height of all his conquests, which even struck terror on the great king of Persia, stopped, and turned back, out of deference to the *ephori*, when they recalled him.

Some authors deny, that the *ephori* were established by Lycorgus, dating their origin 130 years after the time of that legislator.

Thus Plutarch, in his life of Cleomenes, ascribes their institution to Theopompus, king of Sparta, which is also confirmed by the authority of Aristotle. Polit. lib. v. The *ephori* were five in number, and annually chosen by the people out of their own body. The year was determined from the first election of these magistrates, and the Lacedæmonian armies took their names from the principal *ephori*, as those of Athens did from their chief archon.

EPHYDOR, *Epheus*, in *Antiquity*, an officer in the Athenian courts of justice, who was to provide the plaintiff and defendant with equal water-hour-glasses. When the glass was run out, they were not permitted to speak any farther, and therefore we find they were careful not to lose or mispend one drop of their water. Whilst the laws quoted by them were reciting, or if any other business happened to intervene, they gave order that the glass should be stopped. Pont. Archæol. Græc. lib. i. cap. 21, lib. i. p. 118.

EPHYDRUM, *Epheus*, in *Botany*, a name given by some of the Greek writers, to the plant now called *equisetum*, or *horsetail*.

EPHALOS, from *ephe*, *gentle*, and *alos*, *fever*, in the *Medical Writings of the Ancients*, the name of a fever, in which the patient labours under a preternatural internal heat, while he at the same time shivers with cold. It has by some been called the *shivering-fever*; and the Romans named it *gurgura*. Galen says it proceeds from a putrefied acid phlegm. The word is, by some, also applied to any gentle fever, or seventh complaint; and by others, to the cold or shivering fit preceding a fever. Hippocrates calls by this name that peculiar fever which attends young women, whose menfes are stopped by taking cold, or other accidents.

EPHATAE, *Epheata*, among the Greeks, marines or soldiers who served on board the ships of war. They were armed in the same manner as the land-forces, only that more of them wore full or heavy armour. Pont. Archæol. Græc. tom. ii. p. 120.

EPHATERION, a poetical composition, in use among the ancient Greeks. When any person of condition and quality returned home after a long absence or journey, into another country, he called together his friends and fellow-citizens, and made them a speech, or rehearsed them a copy of verses, wherein he returned solemn thanks to the immortal gods for his happy return; and ended with an address by way of compliment to his fellow-citizens.

These verses made what the Greeks call *epitaphion*, *epitapherion*, of *ephe*, *I go abroad*. At going away they had another, called *epitapherion*.

EPIC poem, an heroic poem, or a poem reciting some great and signal transactions of a hero; called also *epopœa*.

Such are the *Iliad* and *Odyssey* of Homer, the *Æneid* of Virgil, the *Gerusalemme* of Tasso, the *Paradise Lost* of Milton, and the *Henriade* of Voltaire, which are the principal poems of the *epic* kind.

An *epic* poem, according to Boiss, is a discourse invented with art, to form the manners, by instructions diffused under the allegory of an important action related in verse, in a probable, entertaining, and surprising manner.

The *epic* poem is distinguished from comedy, in that the action of the latter is not important, nor is related by the poet, but acted by the persons introduced for that purpose; which circumstance, likewise, distinguishes it from tragedy. It differs also from tragedy in the event, or conclusion, which, in the latter, is generally unfortunate, but never so in the former.

Nor is it a philosophical poem, as that of Lucretius, or the *Creation* of Sir R. Blackmore; nor a treatise of agriculture, or the like, as the *Georgics* of Virgil; those poems not being intended to form the manners: beside that the instructions they contain are naked, simple, and direct, without any disguise or allegory. Which second circumstance likewise distinguishes it from a treatise of morality, written in verse, or a simple history in verse, as the *Pharsalia* of Lucan, the *Panic War* of Silius, or the *Civil Wars* of Sam. Daniel; add, that its being confined to one important action, distinguishes it from a poem which relates all the actions of a person's life, as the *Thebaid* and *Achilleid* of Statius, which are what we properly call *heroic poem*.

M. de la Motte, indeed, in his controversy with M. Dacier,

Dacier, on the subject of Homer, maintains, that the whole life of a hero may justly be made the subject of an *epic poem*; and even that the Latin of M. Boileau might pass for an *epic poem*; but he seemed afterwards to return to the common sentiment. In effect, the question is not as to the sense which may be annexed to the words *epic poem*, but the sense which custom has actually annexed to them.

If we had only regard to the etymology of the word *epic*, (of *επι*, *epi*, *poetry*, from *επι*, *epi*, *to speak, relate*), all poems wherein the poet speaks or rehearses things himself, without making the persons of his poems speak except at second hand, as he relates what they spoke on this or that occasion, would be properly *epic poems*; and so there is not an epigram, sonnet, or madrigal, but would come under that denomination: but this were wild.

In effect, the term *epic poem* is only attributed to a composition whose subject is great, instructive, and serious; that only comprehends one single principal event, to which all the rest refer; which principal action is to be terminated in a certain space of time, ordinarily about a year. It is true, all this is arbitrary; but the sense of all words is so too; and in matters of language we must be guided by custom.

If M. de la Motte had only pretended, that one might make a fine instructive poem on the whole life of a hero, or an agreeable and diverting poem on some humorous adventure, all the world would have been on his side. But it is enough that custom has not thought good to apply the term *epic* either to subjects of too much extent, and that are crowded with too many incidents no way connected together; or to burlesque poems, as the *Batrachomyomachia* of Homer, the *Secchia Rapita* of Tasso, the *Défaite de Duleu*, the *Lutrin* of Boileau, the *Hudibras* of Butler, the *Rape of the Lock* of Mr. Pope, or the *Dispensary* of Dr. Garth.

The *epic poem*, then, as appears from what was above observed, bears a relation or analogy to four things, history, morality, fable, and poetry. To history, as both of them relate one or more actions; but then the actions of history are singular, so that the *epic poem* is no history, nor kind of history.

To moral philosophy, as both of them consist of instructions for forming the manners; but the action and allegories distinguish it therefrom.

But it relates entirely to poetry and fable, as being strictly a poem and a fable.

The nature of the *epic poem* is finely drawn by the great critic above mentioned: the *epic poem*, says father Boissieu, have done that with regard to morality which the ancient heathen divines did with regard to divinity. The too great diversity of divine actions and perfections, too very disproportionate to our comprehension, obliged the latter to divide a single idea of a simple essence, God, into several persons, to whom they attributed several names, Jupiter, Juno, Neptune, &c. And, on the contrary, the nature of moral philosophy, which never prescribes rules for particular things, led the poets to collect into one single idea, or into one and the same person, and into apparently singular action, whatever of that kind was found in different persons and different actions.

Thus Aristotle, in *επιχρηστικα*, *επιχρηστικα*, &c. Poetry, says he, teaches moral philosophy, not by relating only, in the manner of a historian, what Alcibiades, for instance, did or suffered; but by proposing what some persons, named as the poet thinks fit, would probably or necessarily have done on the like occasion: and thus it is that he shows either the unhappy consequences usually attending imprudent schemes or ill actions; or the reward of good actions, and the satisfaction resulting from a design laid in virtue, and conducted with prudence. So that in the *epic poem*, according to Aristotle's sentiment, the persons and actions, however named, are all to be feigned, allegorical and universal, not historical and singular.

But the poets, thus taking on them the office of moral philosophers, did not cease to be divines. On the contrary, their morality itself frequently obliges them to introduce the deity in their works; as the knowledge, fear, and love of God, are the first and most solid foundations of all morality. The presence of the divinity, and the share to augment a personage was supposed to have in the action, obliged the poet to make the action great and important, and to have it transacted by kings and princes.

The same likewise obliged them to think and speak in a manner elevated above the common pitch of men, and equal, in some measure, to the dignity of the divine persons introduced. To which end serves the poetical and figurative language, with the majesty of heroic verse. Add, that as so much of the divine and miraculous might ruin the probability, they were hereby obliged to have recourse to several rules to maintain the same.

Thus much the poets were driven to by the fableness of the things they had chosen for the matters of their poems and instructions. The manner of delivering them usefully and methodically, obliged them to several other necessary rules.

The *epic poem* is intended more for the manners and habits, than for the passions. Their latter rise all at once, and their violence is but of short duration; but the habits are more calm and improved, or quitted more leisurely. Consequently, the *epic action* could not be included in the space of a day, as that of the theatrical. A longer time was necessary than is required for tragedy, which is altogether for the passions.

This distinction has introduced great difference between tragedy and *epic poetry*. The tragic violence requires a more lively and animated representation than a mere recital: accordingly, it is wholly thrown into action, and the poet never speaks at all, as he does in the *epic poem*, where there are no actors. An *epic poem*, properly so called, should be written in honour of the country and religion of the author, between which and the hero there is a near relation, and therefore he ought at least to come off in triumph. See farther of the nature of the *epic poem* under *FABLE*. For its matter, see *ACTION*. For its form, see *NARRATION*. For its verification, see *HEXAMETER*. See also *MANNERS*, *CHARACTER*, *MACHINES*, &c.

EPICLYMMA, a word used by some of the Old Writers as *Epitaph*, and not well understood by their commentators.

EPICARPIUM, *Επικαρπιον*, formed of *επι*, *epi*, and *καρπος*, *carpos*, in *Medicine*, a kind of remedy, usually in form of a castileum or plaster, consisting of sharp, penetrating ingredients, as garlic or onion, spider-webs, heliobes, camphor, Venice treacle, &c. applied round the wrist, at the beginning of the access of a fever, to prevent the growth of the same.

EPICAUMA, from *επι*, *epi*, and *καυμα*, *cauma*, a crusty ulcer that sometimes happens to the black of the eye.

EPICEDION, *Επικεδιον*, formed of *επι*, *epi*, and *κεδος*, *kedos*, funeral, in the Greek and Latin Poetry, a poem, or poetical composition, on the death of a person.

At the obsequies of any man of figure, there were three kinds of discourses usually made; that rehearsed at his bier or funeral pile, was called *epitaph*; that engraven on his tomb *epitaph*; and that spoken in the ceremony of his funeral, *epicedion*. We have two beautiful *epicedia* in Virgil, that of Euryalus, and that of Pallas.

EPICERASTICS, *Επικεραστικα*, formed of *επι* and *κερας*, *keras*, moderate, in *Medicine*, remedies, which, by their temperate moisture, lessen the acrimony of a humour, and allude the painful sensation of a part irritated or affected by it; such are the roots of asinus, mallows, liquorice; leaves of lettuce, mallows, water-lily, purslain; the seeds of flax, poppy, &c. See *EMOLLIENTIA*.

EPICHIROMA, *Επιχιρομα*, in *Logic*, an argumentation, consisting of four or more propositions, some whereof are proofs of others.

Thus, that oration of Cicero for Milo may be reduced to the *epichiroma*: "Those who say they will kill him, it is lawful for him to kill, as is allowed by the laws of men and nations, and by the practice of the best men; but Clodius says Milo will kill with that view, as appears from his forming an ambuscade before his country-house, and from his provision of weapons, soldiers," &c. Therefore it was lawful for Milo to kill Clodius.

EPICHIROTONTA, among the Athenians. It was ordained by Solon, that once every year the laws should be carefully revised and examined; and if any of them were found unsuitable to the present state of affairs, they should be repealed. This was called *epichiroton* *to nomon*, from the manner of giving their suffrages, by holding up their hands. See a farther account of this custom in *Pott. Archæol. Græc. lib. i. cap. 20, tom. i. p. 142*.

EPICHOORDIS, from *επι*, *epi*, and *χορdis*, *chordis*, in *Anatomy*, a name given by some to the mectentery.

EPICLEROS, *Επικληρος*, among the Athenians, a daughter that had no brothers, and therefore inherited her father's whole estate. See *EPICLASIA*.

EPICENE, *Επιγενος*, in *Grammar*, a term applied to nouns, which, under the same gender and termination, mark, indifferently, two kinds of sexes. See *GENDER*.

Such, in Latin, is *aquila*, *uorsorius*, &c. which signify equally a male or female eagle or bat.

Grammarians distinguish between *epicenes* and common. A noun is said to be common of two kinds, when it may be joined either with a masculine or a feminine article; and *epicene*, when it is always joined to some one of the two articles, and yet signifies both genders.

EPICOLIC regions (from *επι*, *epi*, and *κολος*, *colos*, the

put, so called) a name given by Dr. Giffen to that space on both sides, over the colon.

EPICRANIUM, in *Anatomy*, a name given by Albinus to the fleshy covering of the head, divided by authors into several different muscles. The head is covered with a thin coat: the hinder parts of this coat are called the occipital muscles, and the fore part the frontal muscles.

EPICRASIS, in *Anatomy*, is a gradual evacuation of all humours in the blood.

EPICRISIS, *Enasis*, in *Rhetoric*, a clear and brief declaration of the speaker's judgment concerning the subject in hand. Thus, *epi sic statui, in optima imperatoria quatuor has res esse optores, &c.* Vell. Rhet. lib. vi. p. 405.

EPICUREANS, a sect of ancient philosophers, who adhered to the doctrines and opinions of Epicurus.

Epicurus was an Athenian, and the son of Neocles, born in the third year of the 100th Olympiad, and consequently 341 years before Christ. He spent his youth partly in the Isle of Samos, and partly at Teos, and did not return to Athens till he was eighteen years old: whence he removed at the age of twenty-three to Colophon, and sojourned in several places before he fixed again at Athens, in the thirty-fourth year of his age. He was the disciple of Pamphilus the Pisticus; and he studied the writings of Anaxagoras, Archelaus, Metrodorus and Democritus. He began to form his school at Mitylene and Lampachus about the thirty-second year of his life; though he afterwards removed to Athens, where he philosophized chiefly in his garden, teaching a great number of disciples, who flocked to him from all the cities of Greece and Asia, and even from Egypt, and who lived in common with their master. His own life was exemplary, though it has not escaped calumny. He died of the strangury at seventy-two years of age. His memory was greatly respected by his followers, and his doctrine revered as an oracle: and as long as learning flourished in Greece, and Rome was protected from the Barbarians, the school and discipline of Epicurus continued eminent.

His birthday continued to be observed in Pliny's time; and the whole month in which he was born was observed as a perpetual festival. Cicero de Fin. lib. v. init. and Plin. lib. xxv. cap. 2.

The noble poet Lucræti, who has given us a beautiful system of *Epicureanism* in fine Latin verse, prefers its father Epicurus to all other philosophers, whom he makes no scruple to say, he observed as much as the fun does the other stars. It is said he first taught grammar; till, upon reading Democritus's books, he began to apply himself to philosophy.

From Democritus he learned the doctrine of atoms, or corpuscules, which he afterwards made the basis of his physics. Clem. Alexand. Strom. 6. advances, that Epicurus held his chief doctrines from Democritus: but it is certain, his greatly improved and illustrated them. Diog. Laertius affirms so, he composed an infinite number of volumes. Diog. Laert. in Proem. lib. x. p. 26. This philosophy consisted of three parts: *cosmology, mathematics, physics, politics, and ethics*, which he explained briefly in three epistles.

The first, as Laertius relates, was about the canons, or rules of judging; wherein, rejecting the use of logic, he established the senses, passions, and anticipations, as the criterions, or judges of truth.

The canons of sense are the following four: sense is never deceived; and therefore every sensation, and every perception of an appearance is true. Opinion succeeds sense, and is superadded to sensation, and capable of truth or falsehood: all opinion attested, or not contradicted by the evidence of sense, is true, and the contrary opinion is false. The canons of anticipation are also four: all anticipation, which is in the mind, depends on the senses, by incurison, proportion, similitude, or composition. Anticipation, or premonition, is, as it were, the definition of the thing, without which we cannot enquire, doubt, think, nor so much as name any thing. Anticipation is the principle in all discourse, as being that to which we have regard, when we infer that one thing is the same or different, joined with or disjoined from another; that which is not manifest ought to be demonstrated out of the anticipation of a thing that is manifest. The canons of passion likewise are four: all pleasure, which hath no pain in it, is to be embraced; all pain, that hath no pleasure with it, is to be shunned; all pleasure, which hindereth a greater pleasure, or procureth a greater pain, is to be shunned; all pain, which putteth away a greater pain, or procureth a greater pleasure, is to be embraced.

In the second, he laid down atoms, space or vacuum, and gravity, as the first principles of all things. The universe, he taught, consisted of atoms or corpuscules, of

various forms, magnitudes, and weights, which having been dispersed at random through the immense space, or space, fortuitously concurred into innumerable systems or worlds, which were thus formed, and afterwards, from time to time increased, changed, and dissolved again, without any certain cause or design; without the intervention of any deity, or the interdependence of any providence. See **ATOMICAL** and **CORPUSCULAR** philosophy.

Not that he denied the existence of a God; on the contrary, he asserted it; but he thought it beneath the majesty of the Deity to concern himself with human affairs.

Thus Epicurus denied a providence, and every kind of natural and moral administration of the Deity. But though he adopted the notion of Leucippus and Democritus, concerning the formation of the world by the fortuitous concourse of atoms, he rejected the opinion of FATE. In this particular, he abandoned the systems of atoms, and the necessitating destiny, arising from the external and immutable laws of motion, to which Democritus ascribed the production of the world, and maintained the liberty of human actions. But nothing can be more absurd than his reasoning on this subject. He gave his atoms a motion of declination, wherein he established the fate, source, and principle of free actions; pretending, that by this means, there were events independent of fatal necessity. Before him, no other motion was admitted in atoms but that resulting from their weight and their reflexion; the first of which was always in perpendicular lines, and in *viciss* ever the same; nor was it changed, except when one atom struck against another. Epicurus, on the contrary, supposed, that even in the midst of the vacuum atoms did somewhat decline from the direct line; and hence, he said, proceeded liberty. Thus also he accounts for the concurrence of various atoms in the production of the world. Cicero has exposed the absurdity of this notion of declination in his book De Fato, cap. 10. See also de Fin. lib. i. cap. 6.

The theology of Epicurus was not only essentially defective in his disbelief of providence, but likewise in his notion of the mortality of the soul, and rejection of a future state. Death, according to his system, was a mere privation of sense; when the body was dissolved, the soul was dissipated, had no longer the same faculties, nor was any longer moved, nor had any sense. The soul was dissipated into the principles and little bodies of which its texture was composed; and he argued this dissolution of the soul from its being compounded, and having a beginning. Mochmus has, therefore, justly observed, that of all the philosophers, the Epicureans enjoyed the greatest reputation, and had undoubtedly the greatest number of followers, because their opinions tended to encourage the indolent security of a voluptuous and effeminate life, and to banish the remorse and terrors that haunt vice, and naturally incommode the wicked in their sensual pursuits. Eccl. Hiit. vol. i. p. 135. 8vo.

As to ethics, his first principle, or the supreme felicity of man, he held, was pleasure: which sense, as hereafter observed, understand of mental, and others of carnal pleasure.

The Epicureans have, in all ages, been derided for their morals, and their attachment to the pleasures of sense: several authors, particularly Cicero among the ancients, and Gassendus among the moderns, have endeavoured to vindicate them from this charge; by shewing that the pleasure wherein their master Epicurus places the summum bonum, or supreme happiness of this life, was not any sensual, or brutal pleasure, but a contentment, and tranquillity of mind, exempt from all tumultuous passions, &c.

This opinion seems just, and well-grounded; but, without entering into the question, which Gassendus, Du Rondel, and others, have exhausted, it is certain, that in the common use of the word, Epicurean is understood to signify an indolent, effeminate, and voluptuous person, who only consults his particular and private pleasure, without concerning himself with any thing serious.

In effect, there were always two kinds of Epicureans; the rigid, and remiss: the rigid Epicureans were those strictly attached to the sentiments of Epicurus, who placed all their happiness in the pure pleasures of the mind, resulting from the practice of virtue. The loose or remiss Epicureans, taking the words of that philosopher in a more gross sense, placed all their happiness in pleasures of the body, in eating, drinking, lying, &c. The former kind, who were the genuine Epicureans, called the others the *followers of their fall*. Seneca's Hiit. of Philosophy, part xiii. Gassendus de Vita & Moribus Epicuri. Bayle, art. Epicurus.

EPICYCLE, in *Astronomy*, a circle, whose centre is on the circumference of another circle which bears it, and which for that reason is called its *deferent*.

The word is formed of the Greek *epi*, upon, and *kyklos*, circle, q. d. *a circle on a circle*.

As astronomers invented an eccentric circle to solve the apparent irregularity of the planets, and their different distances from the earth; they likewise invented a little circle to solve the flatness and retrogradations of the planets: this circle, which they call *epicycle*, has its centre in the circumference of another greater, which is the eccentric of a planet.

In this eccentric the centre of the *epicycle* moves, carrying with it the planet fixed in its circumference, the centre of the planet, all the way, moving regularly along the circumference of the *epicycle*, when downwards, according to the order of the signs, and when upwards, contrary to it.

The highest point of the *epicycle* is called the *apogee*, and the lowest the *perigee*.

The great circle, in whose circumference the centre of the *epicycle* is placed, is also called the *deferent* of the *epicycle*, whose centre is in the orbit of the earth, according to the hypothesis of Copernicus; but of that of Ptolemy, who supposed the heavens fixed, the *epicycle* was a sphere, which revolved with the moon, of the thickness allowed its heaven or orbit, and which sometimes directed it higher, and sometimes lower. See *Ptolemaic System*.

"The astronomers, who deny the motion of the earth, in order to render the phenomena of the motions of the planets more consistent with the motion of the sun, have allied the orbit of the earth, as an *epicycle* to the orbit of the planets; so that the planet should proceed in an *epicycle*, while it is carried through its orbit round the sun; but this is far from answering their expectations." Wolf. *Elem. Math.* tom. ii. p. 501.

"Riccioli, though a zealous enemy of the motion of the earth, could not make any astronomical tables that should not tolerably agree with observation, without supposing the earth to move; not, though he called in all the foreign and forced alliances of changeable *epicycles* liable to continual increase and decrease, and variously inclined to the ecliptic." De Chales *Astron. Reform.* lib. x. cap. 1. fol. 353. &c.

Epicycles have likewise been introduced by Dr. Halley and Mr. Machin, to account for the inequalities of the moon's motion. See *Moon*.

EPICYCLOID, in *Geometry*, denotes a curve generated by the revolution of a point of the periphery of a circle, along the convex or concave part of another circle.

A point of the circumference of a circle, proceeding along a plane in a right line, and at the same time revolving on its centre, describes a cycloid.

And if the generating circle, in lieu of moving on a right line, moves along the circumference of another circle, whether equal or unequal, the curve described by any point in its circumference is called an *epicycloid*.

If the generating circle proceeds along the convexity of the periphery, it is called an *upper*, or *extrin* *epicycloid*; if along the concavity, a *lower*, or *intrin* *epicycloid*.

In an *epicycloid*, the part of the circle the generating point moves along, is called the *base* of the *epicycloid*: thus in *Tab. Geom. fig. 58*. DB is the base of the *epicycloid*, V its vertex; V B its axis; DPV half of the *extrin* *epicycloid*, made by the revolution of the semicircle VLB (which is called the *convex*) along the convex side of the base DB; as DPU is the *intrin* *epicycloid*, formed by the generatrix revolving along the convex side of the base.

The length of any part of the curve, which any given point in the revolving circle has described from the time it touched the circle wherein it revolved, is to double the versed sine of half the arch which at that time touched the quiescent circle, as the sum of the diameters of the circles to the semidiameter of the quiescent circle: provided the revolving circle moves upon the convex side of the quiescent circle; but if upon the concave side, as the difference of the diameters to the semidiameter. Dr. Halley gives us a general proposition for the measuring of all *epicycloids* and *epicycloids*: thus, the area of a cycloid, or *epicycloid*, either primary, or contracted, or prolate, is to the area of the generating circle; and also the areas of the parts, generated in those curves, to the areas of analogous segments of the circle; as the sum of double the velocity of the centre, and velocity of the circular motion, to the velocity of the circular motion. The demonstration brevif, see in *Phil. Trans.* N° 218.

Spherical epicycloids are formed by a point of the revolving circle, when its plane makes an invariable angle with the plane of the circle on which it revolves. Messrs. Bernoulli, Maupertius, Nicole, and Clairaut, have demonstrated several properties of these *epicycloids*, in *Hist. Acad. Sc.* for 1732.

Vol. II. N° 115.

EPICYCMA, from *επι*, *ἐπι*, a word used by Hippocrates to signify a focus, or a false conception, or mole coming on after the conception of a former or regular foetus.

EPIDAURIA, *ἑπιδαυρία*, in *Antiquity*, a festival celebrated by the Athenians in honour of Esculapius.

EPIDELLOS, a word used by Hippocrates, for a youth in the time of his growth, from the age of fifteen to that of fourteen. The same author also uses it in a very different sense, expressing by it the observable days in a disease, such as the fourth, eighth, and eleventh, which indicate what sort of crisis is to be reasonably expected on the great critical day.

EPIDEMIA, *ἐπιδημία*, in *Antiquity*, feasts of Apollo at Delphos, and Miletus; and of Diana at Argos.

Their feasts bore the name *epidemia* (from *επι*, *ἐπι*, and *δῆμος*, *people*) because these gods were imagined to be present on those days among the people. Accordingly, on the last day of the *epidemia* they sung an hymn called *ἐπιδημιαστήριον*, to bid them adieu, and let them forwards on their journey.

As those gods could not be every where, and yet were honoured in many different places, there were times allowed them to pass from one place to another, to receive the vows of their adorers. See *Scaliger*, *Poet. lib. iii. cap. 114*.

Epidemias were also private festivals, and times of rejoicing, when a friend, or relation, had returned from a journey. *Pont. Archæol. Græc. lib. ii. cap. 20. tom. i. p. 394*.

EPIDEMIC, *ἐπιδημία*, denotes a general or spreading disorder, as a plague, arising from some corruption or malignity in the air, which infects great numbers of people in a little time.

The word is Greek, formed of *επι*, and *δῆμος*, *people*; such diseases running among all kinds of people, of whatever age, sex, quality, &c. as arising from a common or general cause.

The Latins call them *populæ malis*, *popular disorders*, in opposition to those called *privatis*, which are only here and there, as arising from private or particular causes. See *SYNONYMIE*.

Epidemic diseases differ from *endemic*, which imports diseases peculiar to some particular country, region, or people; whereas *epidemic* diseases are such as are peculiar to certain seasons.

Pertinent to the present subject are the observations of the celebrated Boerhaave on *epidemic* diseases. We must remark, says this author, that though every particular disease of the body in various *epidemic* constitutions appear, to insensitive observers, the same with regard to their names, signs, and, in some measure, in their consequences; yet the same diseases appearing in one *epidemic* constitution, differ exceedingly from those produced in another, with respect to their obscure natures; their appearances are observable, except by the judicious; the various times of their increase, state, coction, crisis, effect, event, and method to be pursued in their cure. Hence, it is evident that they require a different administration of the non-natural, different treatment and medicines. This variety, however, in *epidemic* distempers, is so obscure, that physicians have not yet been able to deduce it from any abuse of the non-natural; and yet there are many circumstances that render it highly probable, that the causes reside in the air, but depend more upon the inextinguishable variety of exhalations contained therein, which by their mixture with the fluids of the body, or their stimulus, injure the human machine, than upon any change in the sensible qualities thereof. But it is very surprising, that these *epidemic* disorders should be principally propagated by contagion, received from one, by another person unaffected. Upon the invasion of any unknown *epidemic* distemper, the physician will receive some information with respect to the cure; first by reducing the distemper to some more known species, which it most resembles; secondly, by observing its tendency at the vernal and autumnal equinoxes, at which seasons it is generally most prevalent; thirdly, by attending to the spontaneous phenomena, which precede, accompany, or follow, the recovery or death of the patient; and the different fluxes of the disorder; fourthly, by diligently remarking the benefit or injury received, from whatever the patients are unavoidably obliged to do, as from whatever is taken into, or discharged out of the body; fifthly, by comparing the cases of many patients labouring under the distemper, at the same time; sixthly, by obtaining from all remedies which are dubious, which exagitate, and induce a considerable change in the humours, and thereby obscure the genus of the disease.

From these circumstances, duly attended to, the curative indication may be discovered. See *Pediluvium*, *DISEASES*.

EPIDENDRA, from *epi*, upon, and *dendron*, tree, in *Natural History*, a word used by Sir Hans Sloane, and some other authors, to express those plants which grow upon others, such as the *MILLETTOE*, which grows upon the apple-tree, &c. These are more commonly distinguished by the name of parasitical plants. See **DOUDER**.

EPIDENDRUM, in *Botany*. See **VANILLA**.

EPIDERMIS, in *Anatomy*, the cuticle, or leath-skin.

The word is formed of the Greek *epi*, *super*, and *derma*, skin.

Some hold the *epidermis* to be formed of the excrements of the *derma*, or true skin. Hippocrates is of opinion, it is engendered by cold; as on blood, humors, or the like, when cold, we see a pellicle formed.

But it is now past doubt, that it is produced at the same time, and after the same manner, with the other parts: it being found in foetuses of all ages, in the womb; it has neither veins, arteries, nor nerves; whence it is inferrible. See **CTRICULA**.

EPIDECASIA, *ἐπιδέκασια*, among the *dicotyledons*. Daughters inheriting their parents estate, were obliged to marry their nearest relation; which gave occasion to persons of the same family to go so low much one another, each pretending to be more nearly allied to the heirs than the truth. The fruit was called *ἐπιδέκασια*; from; and the virgin, about whom the relations contended, *ἐπιδέκασια*. Pott. Archæol. Græc. lib. i. cap. 24. tom. i. p. 147.

EPIDIDYMUS, in *Anatomy*, a little round body, on the back of each **TESTICLE**; called also **PARASTATA**.

The word is formed of *epi*, upon, and *didymus*, twin, twice. See **PITUITA**.

EPIDOTES, from *ἐπιδότω*, I cause to grow, in *Mythology*, deities which were supposed to preside over the growth of infants.

EPIDROMUS, of *epi* and *dromos*, *strasse*, in the *Ancient Shipping*, a sail near the stern, which was the largest but one in the ship.

EPIGÆA, *Ἐπιγæα*, in *Botany*, a genus of the *dicotyledonous* class. Its characters are these: the flower hath a double empanement, the outer composed of three, and the inner of one leaf, divided into five parts; the flower is of a salver-shape, and hath ten slender stamens of the length of the tube. In the centre is situated a globular germ, which afterward becomes a depressed five-cornered fruit, with five cells, containing several seeds. There is one species, a native of North America.

EPIGASTRIC region, in *Anatomy*, is a name given to the upper part of the **ABDOMEN**, reaching from the cartilago xiphoides almost to the navel.

It is usually divided into three parts: the sides, or lateral parts, called *hypochondria*; and the middle, the *epigastrium*.

There are also two *epigastric* veins, and as many arteries. The arteries are branches of the iliac external arteries; the veins discharge themselves into the iliac external veins. See *Tubo Intest. (Aegrotus)* fig. 1. N° 57. fig. 6. N° 2.

EPIGASTRIUM, of *epi*, upon, and *gaster*, belly, in *Anatomy*, the middle part of the *epigastric* region.

EPIGLOTTIS, of *epi*, upon, and *glottis*, in *Medicine*, are new symptoms which occur in the progress of a disease. See **EPITHYMOUS**.

EPIGLOTTIS, of *epi*, upon, and *glottis*, or *glottis*, in *Anatomy*, the cover, or lid, of the **LARYNX**.

The *epiglottis* is a thin, moveable cartilage, made in form of a leaf of ivy, or a little tongue, and therefore likewise called lingula; serving to cover the cleft, or rim, of the larynx, called *glottis*.

Galen takes the *epiglottis* to be the principal organ, or instrument of voice; serving to vary, modulate, and render it harmonious.

In base, which is pretty broad, is in the upper part of the cartilago quadriformis, and its point, or tip, turned towards the palate. It is only that by the weight of the piece in swallowing; though not to exactly, but that a crum or stop, sometimes escapes through the trachea.

EPIGLOTTIS, a word, used by some of the old writers in *Medicine*, to express the upper part of the buttock.

EPIGONATIS, a name given, by some anatomists, to the *epiglotis*.

EPIGONUM, *Ἐπιγόνυ*, a musical instrument among the ancients, with forty strings, to which from its inventor Epigonus, a native of Ambracia, a city of Epirus. Mem. Acad. Inscript. vol. v. p. 167.

EPIGRAM, in *Poetry*, a short poem, or composition in verse, treating only of one thing, and ending with some point, or lively ingenious thought.

The word is formed of *ἐπιγραφή*, inscription, of *ἐπιγράφω*, to inscribe, or write upon.

Epigram then, originally, signifies *inscriptions*, and they derive their origin from those inscriptions placed by the ancients on their tombs, statues, temples, triumphal arches, &c. See **INSCRIPTION**.

These, at first, were only simple monograms; afterwards, increasing their length, they made them in verse, to be the more easily retained: Heronotus, and others, have transmitted to us several of them.

Such little poems retained the name of *epigram*, even after the design of their first institution was varied, and people began to use them for the relation of little facts and accidents, the characterizing of persons, &c.

The Greeks confine their *epigram* to a very narrow compass; for though, in the Anthology, we here and there meet with a very long one; yet, ordinarily, they do not exceed six, or, at most, eight verses. The Latins were not always so scrupulous, and the moderns much less, as to their bounds.

M. le Brun, in the preface to his *Epigrammes*, defines an *epigram* a little poem, susceptible of all kinds of subjects, and ending with a lively, full, and unexpected thought; which are three qualifications essential to the *epigram*, particularly the first and last of them, viz. brevity, and the point or close of the *epigram*.

To attain brevity, only one thing is to be aimed at in the poem, and that to be pointed in the concise terms possible. Authors are much divided, as to the length the *epigram* is to be confined to: the ordinary limits are from two to twenty verses; though we have instances, both among the ancients and moderns, where they extend to fifty. But still it is allowed, that the shorter the better, and more perfect, as it partakes more of the nature and character of this kind of poem. The point or turn is a quality much insisted on by the critics, who require the *epigram* constantly to close with something poignant and unexpected, to which all the rest of the composition is only preparatory. Others there are, who exclude the point, and require the thought to be equally diffused throughout the whole poem, without laying the whole stress on the close: the former is usually Marial's practice, and the latter that of Catullus. Which is the most beautiful and perfect manner, is disputed by a third class of critics.

The Greek *epigram* have scarce any thing of the point, or bitterness of the Latin ones: those collected in the Anthology, have most of them a remarkable air of ease and simplicity, attended with something just and witty; such as we find in a sensible peasant, or a child that has wit. They have nothing that bites, but something that tickles. Though they want the taste of Martial, yet, to a good taste, they are not insipid; except a few of them, which are quite flat and pointless. However the general faintness and delicacy of the pleasing in them, has given occasion for a Greek *epigram*, or *epigramme à la Grecque*, to denote, among the French, an *epigram* void of fat or sharpness.

It is principally the point that characterizes the *epigram*, and distinguishes it from the madrigal. See **POINT**. In the modern verification, as observed by F. Mourgues, the *epigram* and madrigal are distinguished by the number of verses and the close. 1. by the number of verses, which in the modern *epigram* does not go beyond eight, nor in the modern madrigal comes short of six; and, 2. in that the close, or period, of the *epigram*, has always something more lively and studied than that of the madrigal.

The *epigram* is the lowest, and least considerable, of all the productions of poetry; and it is in general rather an effect of good luck, than of art, to succeed therein. The fineness and subtlety of the *epigram*, M. Boileau observes, must turn on the words rather than the thoughts; which seems very little to the credit of this kind of composition, as it reduces it to the nature of the pun, or equivocal. F. Boileau confirms the hint, in adding, that the equivocal is what usually shines the most in the *epigram*.

One great beauty of the *epigram* is, to leave something for the reader to guess, or supply. Nothing pleases the mind so much, as to find something in itself in the objects presented to it; nor does any thing disgust it more than to perceive it from flowing and exercising a faculty it values itself for. See **GENIUS**.

The *epigram* admits of great varieties of subjects: some are made in praise, and others to satirize, which last are much the safest; ill-nature serving instead of point and wit. Boileau's *epigrammes* are all satires on one or another. Those of des Raux are all made in honour of his friends; and those of M. de Scudery are to many eulogies. The *epigram* being only a single thought, it would be ridiculous to express it in a great number of verses; it must have its unity like the drama. The comedy has an action for its subject, and the *epigram* a thought.

EPIGRAPH, *Ἐπιγραφή*, *Superscription*, an inscription on a building, to signify its use, occasion, the time when, and the persons by whom it was built.

EPIGRAPHES, *Ἐπιγραφαί*, among the Athenians, officers that rated all those of whom taxes and contributions

tions were required, according to every man's ability, kept the public accounts, and prosecuted such as were behind-hand with their contributions. *Potius Archæol. Græc. lib. I. cap. 14. tom. I. p. 31.*

EPILEPSY, formed of *ἐπι* *epi*, *super*, and *ἑλπίς* *helpis*, or *sele* *sele* *hold* of *ere*, in *Mitatio*, a convulsion, either of the whole body, or some of its parts; attended with a deprivation of the senses and understanding; and returning from time to time in fits, or paroxysms.

In English it is usually called the *falling sickness*, because people fall down when attacked by it. The Latins call it *convulsio morbi*, because when any body was seized with it to a convulsion, or assembly of the Roman people, they presently broke up the assembly, as denoting it an unhappy prodage.

Some call it the *morbus sacer*, as supposing it sent by way of immediate punishment from God. Others, *morbus epilepticus*, others *Mitatio morbi*, others *letitia*, &c.

The *epilepsy* is generally preceded by uncommon weariness, pain of the head, dullness, giddiness, noise in the ears, dimness of sight, palpitatio of the heart, disturbed sleep, difficult breathing, insatiation of the bowels with wind, the evacuation of great quantities of thin urine, pale complexion, coldness at the extremities, and a sensation of cold air, ascending in a kind of stream towards the head.

The patient seized with this disorder, falls instantly and suddenly down; or rather throws and precipitates himself violently to the ground. When down, he grinds his teeth, foams at the mouth, makes an unusual noise, and frequently flukes his head; his arms, legs, neck, back, &c. either becoming rigid, or variously distorted; his thumbs are drawn on towards the palm of his hands; and as all the parts are in a violent contraction, there is frequently an involuntary flux of urine, feces, and fecal matter. After some time he retorts to himself; only retaining a head-ache, heaviness, weariness of the limbs, &c.

Smaller more accurately distinguishes the disease into three degrees: the first, or lowest, is much the same with the highest degree of a vertigo.

In the second, there arise various agitations and geliculations; and the senses, both external, and internal, either remaining, or being transported into a delirium, they dance, sing, laugh, weep, talk folly, shriek, and beat their breasts. Sometimes they remember all after the fit is over, and sometimes nothing at all of what has passed. In the third degree, which also is ordinarily called the *epilepsy*, they lose the use both of reason and sense; fall, or fling themselves down, foam, grind their teeth, and bite their lips, with the other circumstances above related. These affected with the second degree, have been often supposed to be *possessed by the devil*. See *DE MONIAC*.

The paroxysms, according to the diversity of causes, are longer or shorter, and fewer or more frequent. Some have observed that they generally return at stated periods, as on certain days, hours, or months, or on the changes of the moon, especially at the new and full moon; but there is reason to think, from later observations, that this is a vulgar error. See *LUNATIC*.

The paroxysms, according to the diversity of causes, are longer or shorter, and fewer or more frequent. Some have observed that they generally return at stated periods, as on certain days, hours, or months, or on the changes of the moon, especially at the new and full moon; but there is reason to think, from later observations, that this is a vulgar error. See *LUNATIC*. Women are usually seized with these paroxysms at the time of the return of the menses: and what is most observable is, that they are frequently occasioned by seemingly slight causes; commotion of the mind, a colder season than ordinary, the use of strong liquors, close application of the mind to any thing, and, finally, the use of venery often being on their fits. Infancy and youth are the times of life most subject to this disorder, which often goes off at the time of puberty: it more frequently attacks men than women, and is very difficult of cure, especially if the patient is more than twenty years of age, and after forty, a cure is hardly to be expected. When *epilepsy* fits continue long, and return frequently, there is little prospect of relief, and it is a very unfavourable symptom, when the patient is seized with the fit in his sleep.

The cause of this disease Boerhaave attributes to too much action of the brain on the motory nerves, and none on the sensitive ones. Some are pleased to account for it from the abundance of humours mixing with the animal spirits, and giving them extraordinary and irregular motions, and directions; whence arises its distinction from a syncope, and apoplexy, which take away all motion as well as sense. See *SYNCOPE*, and *APOPLEXY*.

The cause of this terrible disorder appears to be a stricture of that membrane which surrounds the brain and the spinal marrow. The remote causes are very various, and thence also the disease varies in its species and appearance. The most terrible and mortal *epilepsy* have been brought on by external violence, by blows, wounds, frac-

tures, and depressions of the cranium. These are generally preceded by pains of the head, and a torpor of the senses; and in these, after the patient's death, corrupted blood or serum is always found either between the dura and pia mater, or between the dura mater and cranium.

Chronical *epilepsy*, returning at stated periods, are also frequently occasioned by certain acute bony protuberances arising internally in the basis of the cranium, and sometimes in the lateral sinus. It is easy to see that the presence of *epilepsy* is incurable, if, yet medicine can no great service in it, by keeping the brain in such a condition, that its pulsations on these protuberances may not be enough to produce a violent fit.

Polypoid concretions in the jugular vein, and obstructions of the sinuses of the dura mater, are also causes of incurable *epilepsy*. The pulsations of the mind also, as anger, fear, and the like contribute greatly to bring on *epilepsy*, as they act immediately upon the nervous system, and either continue or dilate them preternaturally, which cannot be done very often without inducing a bad habit. Infants are often rendered *epileptic* either from sucking the milk of a nurse in a violent fit of passion, or from the violent commotion of mind the mother was subject to while pregnant. The terror of the sight of one person in an *epileptic* fit, has frequently thrown another into the same disorder; and it has been often known, that a strong propensity to recover, from a natural redundancy of semen, being suppressed by chastity, has brought on this disease. Women have fallen into it from violent love affections, and have, in that case, found their cure in marriage. Excessive drinking, intemperate food, worms, restlessness, and the infection of the small-pox, &c. may be reckoned among the causes of this disorder.

M. Poupert, from a dissection of an *epileptic* person, wherein, immediately under the dura mater, was found a deal of white, thick, viscid, pituitous, glue, and as it were incorporated with the membrane, thinks, that this might be the cause of the disease; the excessive quantity of such thick lymph, loading the brain, and obstructing its necessary motions. The first cause, he judges, might be the spongiosity of the dura mater, which imbibed the serosities of the brain.

He adds, that he knew an *epileptic* person, who, upon the first approach of his disorder, rubbed his forehead with his hand, and bent his head as far backward as he could, rolling it against a wall, and by that means secured himself against the convulsion. It is probable, that by this, he gave a motion to the lymph, and drove it from the place which before it occupied.

The *epilepsy* is either *idiopathic*, or *sympathetic*: it is idiopathic, when it arises merely from a disorder of the brain, or spirits; and sympathetic, when it is preceded by some other disease which brings it on.

In the cure of an *epilepsy*, the first intention must be to correct and expel from the body the remote material causes of the disorder; secondly to mitigate the spasm of the dura mater, and nervous parts, by medicines of a sedative and corroborating nature; the former to check and allay the violent motion of the body, the other to restore the due tone, and natural elasticity to the parts, the weakness of which, occasioned by a former fit, gives frequent occasions for succeeding ones. Of the first kind are poppy seeds, or flowers, saffron, nutmeg, and the like; and among the chemical medicines, the *spiritus vitæ dulcis*, when truly prepared. Of the corroboratives to be given in *epileptic* cases, dietary, i.e. invigorating, candiam seeds, and ambergris, spirit of harts-horn, and the oil of hartshorn, made pure by frequent rectifications, are also greatly beneficial. The decoctions of the woods, as guaiacum, cassia, &c. and the like, are also good remedies; and several *epilepsies* have been known to be perfectly cured by taking half a pint of a strong decoction of guaiacum twice a day, with a few drops of spirit of vitriol in each dose, and making all the while a weaker decoction serve for the common drink. It is necessary, however, if there be a redundancy of blood, to begin the cure with frequent bleedings. Cupping on the parts near the head is also of great service, and sometimes opening the jugular vein is necessary, by which alone patients have sometimes been cured.

But though these are the methods of cure, in some cases, yet in others, where the disease has had a different origin, very different means are required. When the disease is hereditary, or proceeds from a wrong formation of the brain, a cure is not to be expected. When it is owing to a debility, or too great an irritability of the nervous system, such medicines as tend to strengthen the nerves may be used, as the Peruvian bark and steel, or the *anti-epileptic* electuaries, recommended by Fuller and Mead. The electuary may be made by mixing an ounce of powdered bark, and half an ounce of powdered steel, and as much cold vitriol rect, with simple syrup.

Dr. Mead directs a dram of an electary, similar to this, to be taken evening and morning, in the *epilepsy*, for the space of three months. The powdered tin is added, because the *epilepsy* often proceeds from worms.

When an *epilepsy* arises from an impure serum, lodged in the vessels and membranes of the head, which too often happens from the sudden drying up of old ulcers, stopping of issues, or the like means, then the intention of cure consists in the dissolution, evacuation, and derivation of the serum to other parts. For this purpose cathartics are to be exhibited, and fetid. Issues and blisters are of singular service. Nature has been known to cure *epilepsy* of this kind, by an eruption of pimples all over the body. And there is recorded in Willis a memorable instance of a girl, subject to frequent returns of *epilepsy*, who, in one of them, happening to fall with her head into the fire, and so accidentally extinguishing it, remained well as long as the ulcers discharged any thing; but when they dried up, the former fits returned.

In *epilepsy* arising from violent emotions of the mind, in which acrid, bilious, and acrimonious humours are conveyed into the nervous system, the use of whey, mineral waters, and proper regimen, aided to the sweetening powders, usually produce a cure. Acidulated medicines are also highly proper, and spirit of vitriol, or *spiritus nitri-dilutus*, are of very singular efficacy. When an *epilepsy* arises merely from pain, as that of the stone, the tooth-ach, when violent, or spasms of the stomach or intestines, then clysters of oil are of very great use; and after these, bleeding is usually very proper.

In the *epilepsy* of infants, arising from gripes, corrupted milk, or difficult digestion, great benefit is to be had from clysters of milk, with a little Venice soap dissolved in it. A few grains of cambray, given internally, often prove also of singular benefit, and mule is known to be a remedy second to none in these cases. When *epilepsy* is caused by worms eroding the inner coats of the intestines, after the use of the common anti-*epileptic* remedies, the medicines for worms must be given, and their use continued, till, by the symptoms ceasing, there is reason to think these pernicious animals are destroyed.

When an *epilepsy* returns at fixed periods, or at the changes of the moon, the cause is usually in the stomach or duodenum, or its adjacent parts, the biliary ducts and pancreas. In this case, therefore, there should always be a clyster given, and afterwards a vomit, before the expected fit.

In the time of the paroxysm of the *epilepsy*, people ought to abstain from the use of substances that are too volatile, spirituous, fragrant, or fetid; for all these fill the head with vapours; nor should such things be exhibited as promote sneezing or vomiting, since they derive the humours to the head, and often recall the paroxysm. The most useful means, in the fit, are to keep the patient in an erect posture, to rub his hands and feet. In all kinds of *epilepsy* it is proper to abstain from wine and malt liquors, and to drink only water. Opium, and too volatile medicines, must be very cautiously given to children, and persons of tender habit; and when *epilepsy* returns from the slightest causes, it is proper to abstain from a load of medicines, and trust to nature and a proper regimen alone. In this regimen the patient must abstain from all strong liquors, from great heat, or excessive cold, from venery, from losing any terrible sight, from anxiety of mind, and from business. Young persons are to abstain from fruit, and all violent emotions of the mind are carefully to be avoided.

Many physicians have prescribed the root of the wild valerian, as a remedy which is alone capable of curing this terrible disease. Hoffman extols the use of ambergris in this disorder. *Opusculum*, lib. 4, cap. 1, § 4. 2. also of mule, lib. 6, § 9. Ten or twelve grains of it, with the same quantity of saccharum cinereum, may be made up into a bolus, and taken every night and morning. He recommends also the spirit of hawthorn, or of ivy, either simple or facinated. The decoctions of the woads *pasnacus*, *lappacea*, *tanacetum*, &c. are also useful, lib. 4. He ascribes great caution in the use of opium, in cases of children, and weak persons. *Id.* Casell. Pract. § 5.

See John Colbatch has an express treatise on the *MILLETUS* of the oak, to prove that it is a specific in this disease.

The *epilepsy* has been sometimes cured by ELECTRICITY.

EPHEMERON, from *ephēmeros*, *lenis* to forget, a term used, by the old writers in *Medicina*, to express a loss of memory.

EPILOBIUM, in *Botany*. See WILLOW-herb.

EPILOGUE, EPILOGOS, in *Oratory*, &c. The peroration, or last part of a discourse, or treatise, containing ordinarily a recapitulation of the principal matters delivered.

The word is Greek, *epilogos*, formed of the verb *epilogos* I say after: the *epilogue* being the end, or conclusion of a discourse.

EPITHET, in *Dramatic Poetry*, is a speech addressed to the audience, when the play is over, by one of the principal persons, or actors in the piece; containing usually some reflections on certain incidents in the play, particularly those of the part of the person who speaks it.

In the modern tragedy, the *epithet* has usually somewhat of despatch in its intended, perhaps, to compose the passions raised in the course of the representation, and send the audience away in good humour, though how far that design is good and laudable, will bear some dispute: an ingenious author in the Spectator compares it to a merry jig on the organ, after a good sermon, to oblige any unprejudiced that might have been made thereby, and send the people away just as they came.

In effect, though the *epithet*, in this sense, may seem an abuse, yet has it the countenance of antiquity; the Romans had something of the same nature, though under another name. Their exodium was a kind of farce, brought on the stage when the tragedy was over: *at quicquid scripserunt ut vestitus epilogon et tragicis afflicto, busque postulat rursus deterget*, says the Choicist of Juvenal. The *epithet* is but of modern date, much later than the prologue. Many, indeed, have taken the exodium of the ancient Greek drama for an *epithet*, because Aristotle defines it to be a part rehearsed after the chorus had sung for the last time; but, in reality, it was of a quite different nature. The exodium was the last of the four parts of the tragedy; containing the unravelling and catastrophe of the plot, and answering to our last, or fifth act.

EPIMEDIUM, in *Botany*. See BARRENWORT.

EPIMELIS, a name given by the old writers in *Medicina*, to a species of medlar, or, as some will have it, to a kind of summer-apple.

EPIMETRON, of *ἐπι*, and *μέτρον*, *measure*, in *Antiquity*, an allowance given the tax-gatherers in the Roman provinces, over and above the just quantity of wine or grain they were obliged to furnish. The *epimetron*, or over-measure, in different provinces, was different, being always greater in those that were remote, than in the nearer provinces. The different kinds of things wherein it was given, made likewise a difference in the quantity allowed. The reason of allowing an *epimetron*, or over-measure, was to make good the leakage of the wine, and waste of grain, that would necessarily happen by transporting it to Rome.

The provinces whose taxes were converted into money, and paid in specie, were free from the *epimetron*.

EPITHORIOS, *Επιθωριος*, *superparticularis*, *ad usum*, I divide, an epithet given by Galen to certain differences in the pulse, with respect to their inequality as to the time of their beating. All time, rhythm, or modulations of the pulse, according to number, consist, he observes, of equal or unequal proportions. Of equal, when the time of the distention is equal to that of contraction; and of unequal, when the one of these exceeds the other; and this inequality may be from certain or uncertain excesses. The certain excesses may be either in multiple proportion, or at numbers to number, which is the *epithorion*.

EPIMULIS, of *ἐπι*, upon, and *μύς*, *whisker bone* on the top of the *snout*, a name given, by some anatomists, to the postilla, or knee-pan.

EPITHYTHON, *Επιθυθων*, in *Rhetoric*. See FABLE.

EPINENEUCOS, from *ἐπει*, *I wish* is the old writers of *Medicina*; a word used to denote a sort of unequal pulse, beating differently in the different parts of the same artery; as when it rises strongly against the two middle fingers of the physician who feels it, and weaker at the extremes; this sort of pulse is described by Galen as common to hectic patients, and is called also *peripneusticus*.

EPINETHELOS, of *ἐπι* and *νέσσω*, *cloud*, in the writings of the *Ancient Physicians*, a term used to express the cloudy matter seen floating in the urine in fevers. See. See ENOEMA.

EPINEUX *des lumbes*, in *Anatomy*, a name given by Winslow, and some other of the French authors, to certain small muscles of the loins, not mentioned by the old anatomists; but called by Abbius, *interfasciales lumborum*.

EPINICION, *Επινικιον*, from *ἐπι*, *super*, and *νικω*, *victory*, in the Greek and Latin Poets, denotes, 1. A feast, ceremony, or rejoicing, on occasion of a victory obtained. 2. A poem or composition, on the same subject. See lighter treatises expressly of the *epinicion* in his Poetics, lib. 1, cap. 14.

EPINYCTIS, of *ἐπι*, and *νύξ*, *night*, in the writings of the *Ancient Physicians*, a term used to express a sort of malignant pulse, which commonly breaks out in the night. It is usually of about the bigness of a large pea, and is sometimes white, sometimes black, according to the nature of the humour it contains, and always has a violent inflammation.

inflammation all round it; when it is opened there is an efflux of sanies, and a mucous exhalation is found within; it is attended with violent pain, and usually breaks out in the upper parts of the body. This is the account Celsus gives of the *epipactis*; but Pausanias and Aetius understand it rather to be a pustule, which gives no great pain in the day, but is very troublesome in the night. Both accounts, however, may be right, and it may both first appear, and be most painful in bed.

EPIPACTIS, in *Bistany* a name used, by some, for the hellebore, or wild, or bastard black hellebore. Rondeletius also uses the same word as the name of the bernardia, or rupturewort.

EPIPEDOMETRY, of *επι*, *met*, *met*, and *μετρον*, *I measure*, in *Mathematics*, signifies the measuring of figures that stand on the same base.

EPIPETRON, in *Bistany*, a name given, by Theophrastus and Aristotle, to a plant, supposed by many to be the same with the empetrum of Dioscorides. But there is great reason to doubt whether the *epipetron* of the two older authors be the same plant; and whether, if they mean two different plants by this name, either of them agree with the empetrum of Dioscorides. Theophrastus says, that his *epipetron* never flowers; and Aristotle says, that his *epipetron* grows on rocky places, and continues to grow after it is taken up, as the orpin and some other plants will do.

EPIPHENOMENA, of *επι* and *φαινεται*, *symptom*, in the writings of the *Ancient Physicians*, a term used to express such of the symptoms, in certain diseases, as did not usually appear till the time that the disease was actually formed, called also *epiphenomena*.

EPIPHANES, of *επι* and *φαναι*, an epithet given to Jupiter, because he manifested his presence by lightning and thunder, &c.

EPIPHANIA, a word used, by some of the ancient physicians, to express the external habit of the body.

EPIPHANY, in *Religious Antiquity*, the feast of kings; a double festival, of the first rank, solemnized on the sixth of January, commonly called *twelfth day*, in honour of the appearance of Jesus Christ to the three kings, or magi, who came to adore, and bring him presents. The feast of *Epiphany*, now held in honour of the adoration of the magi, had its first institution among the Greeks, from a different object, viz. our Saviour's birth; and was called *theophany*, and *epiphany*, that is, appearance, and manifestation, of God.

Pope Julius, who reigned from the year 337, to 352, was the first who taught the church to distinguish the feast of the nativity, and *epiphany*. See *etymol. Paral. ad Const.* p. 27. Act. SS. Mali, tom. vii.

The word in the original Greek, *επιφανεια*, signifies appearance, or apparition; and was applied, as some critics will have it, to this feast, on account of the *fl.* which appeared to the Magi. St. Jerom. and St. Chrysostom, take the *Epiphany* for the day of our Saviour's baptism, when he was declared to man by the voice. *Hic filius meus dilectus, in quo mihi complacet: This is my beloved Son, in whom I am well pleased.* And accordingly it is still observed by the Coptes and Ethiopians in that view. See Ludolph. Hist. *Æthiop.* lib. xxi. cap. 2. Others contend, that the feast of Christmas, or the nativity of our Saviour, was held in diverse churches on this day; which had the denomination *Epiphany*, or appearance, because of our Saviour's first appearance on earth, as at that time. And it must be allowed, that the word is used among the ancient Greek fathers, not for the appearance of the star to the magi, but for that of our Saviour to the world. In which sense, St. Paul uses the word *επιφανια*, *epiphania*, in his second epistle to Timothy, chap. i. ver. 10. Ammianus Marcellinus makes mention of this feast, lib. xxi. cap. 2. and observes that it was held in January. Upon which passage, Valerius, in his notes, endeavours to shew, that the historian meant by *Epiphany* the feast of the nativity.

The heathen writers used the word *epiphania* in the like sense, viz. to express the appearance of their gods on earth. And the Christians, after their example, applied it, in the general, to express any appearance, or manifestation of the Deity.

EPIPHONEMA, *Επιφώνημα*, *Acclamation*, in *Rhetoric*, a sententious sort of EXCLAMATION, which is frequently added after a narrative, or rehearsal of any thing remarkable; containing usually a lively, close reflection on the subject there spoken of, and intended to give it greater force, and render it more affecting to the hearers. Such is that of St. Paul, when after discoursing of the rejection of the Jews, and the vocation of the Gentiles, he cries out,

O the depth of the wisdom and knowledge of God!

Such also is that of Lucræti, after relating the story of Agamemnon's sacrificing his daughter Iphigenia:

Vot. II. N° 216.

Tantum religio potuit suadere malorum!

The *epiphonema* is usually expressive of the milder and more gentle passions, and is not so vehement and impetuous as EXCLAMATION.

EPIPHEOS, in *Bistany*, the name given by the ancients to the DODDER, or culcitra, which grew upon the shrub they called phæox. This was the fucus of the modern Greeks, described by Honorius Belioz. It was a custom, among the old writers, to name the culcitra, or dodder, from the plant it was found growing upon, as they supposed that it in some degree partook of the virtues of that plant. Thus that which grew upon thyme was called *epithymum*, and that upon the nettle, *epiturtica*, and that upon flax, *epilinum*; so of many others.

The shrub pheos was also called *flæbe* by Dioscorides and Theophrastus; and hence this dodder was sometimes called *EPITABE*.

EPIPHLEBOS, of *επι* and *φλεβ*, a vein, in the writings of the *Old Physicians*, a term used to denote such persons as were lean, and of a hot temperament, and whole veins, for that reason, appeared usually very turgid and prominent in the hands, &c.

EPIPHORA, *Επιφωρα*, in *Medicine*, a disease of the eyes, consisting in a preternatural defluxion of rheum, or the matter of tears, occasioned by the partial or total obstruction of the puncta lachrymalis, or the fucua lachrymalis, or the ductus ad nasum, and accompanied, frequently, with heat, redness, and twitching.

The word is Greek, formed of *επιφωρα*, *inferre*, *to draw or bring into*, because of the pain it occasions.

Pitcairn calls it a *catarrh of the glands of the eye*. See CATARRH.

The internal causes of the *epiphora*, of rheum in the eyes, are, a relaxation of the glands of the eyes, and a too great acrimony, or sharpness, of the serous humour separated thereby; which, fretting and viscidifying the eye, draws an unusual quantity of blood and lymph thence; by which, at length, the cheek becomes excoriated, &c. Children are most liable to it, from the frequent use and straining of the glands of the eye in crying.

The external causes of the *epiphora*, are sharp dusts, fleams, &c. entering the eye, and irritating the same; also a too cool and sharp air has frequently the like effect. An inveterate *epiphora* often degenerates into a *visus lachrymans*.

The cure of the *epiphora* is, 1. By causing a revolution, or derivation of the peccant humour, to some other parts, as by venesection, cupping, blistering, or cathartics. 2. By correcting its acrimony by proper remedies. And, 3. By applying astringents externally. Lapis calaminaris is much commended.

The term *epiphora* is used more generally to denote any impetuous influx of the humours, or an inflammation of the blood to any part of the body; and in this sense it may be applied to any inflammatory tumor.

EPIPHYLLISPERMOUS plant, of *επι*, *φυλλον*, *leaf*, and *σπερμος*, *seed*, are the same with the capillaries, herbs which bear their seed on the back part of their leaves. See CAPILLARY.

EPIPHYSIS, *Επιφυση*, in *Anatomy*, a lesser bone, or bony substance, adheing, or growing to another, by the intervention of a cartilage.

The word is formed of the Greek *επι*, *an*, and *φύω*, *to grow*, *adhere*. The Latins call it *appendix*, *additamentum*, *adjuvantis*, &c.

The substance of the *epiphysis* is rare and lax; in young children it is merely cartilaginous; but hardens as they grow in age, and at length, becomes quite bony.

It is commonly laid down, that there is no regular articulation between the *epiphysis* and the bone; though it is certain, that there is a reciprocal admission of the heads or extremities of each, into the cavities of the other. See ARTICULATION.

There are some bones that have no *epiphyses* at all, as the lower jaw; others have no less than five, as the vertebrae. The design of adding *epiphyses* to bones, was, to supply their defects, and render them longer and bigger at the extremes; and thus to render the articulation more firm, and to give greater force to the action of the muscles.

EPIPHITES *veriformes*, are two eminences of the cerebellum, shaped like worms, which keep open the passage from the third to the fourth ventricle.

In distating the third ventricle of the brain, we perceive four eminences, two upper and bigger, called *articular protuberances*; and two lower and less, called *epiphyses of the articular protuberances*. Dionis.

PIPLASMA, the same with *cataplasma*. See CATAPLASMA.

EPIPOCE, *Επιποκα*, in *Rhetoric*, the same with *CLIMAX*.

EPIPOCELE, *Επιποκα*, in *Surgery*, a kind of hernia, or tumor, occasioned by the descent of the epiploon, or

caul, into the scrotum. See **HERNIA**, and **ENTARO-EPILOCELE**.

EPILOCE, or **EPILOID**, a term applied to the arteries and veins, distributed through the substance of the epiploon, or caul. See *Tak. Anat. (Angul.)* fig. 1. n. 37. See **EPILOID**, and **GAUSTRIPLOICA**.

EPILOID, *arteria*, is a branch of the coeliac artery, which runs through the right side of the inner, or hinder leaf of the caul.

EPILOID, *vein*, is a branch of the coeliac artery, springing out of the lower end of the spleen, and running to the hinder leaf of the caul.

EPILOID, *superior*, is a branch of the coeliac artery, which is bestowed on the lower and left side of the caul.

EPILOMOPHALUS, or **EPILOMOPHALON**, compounded of *epi*, *caul*, and *phalos*, *navei*, in *Surgery*, a species of exomphalus, or navel-rupture; being a tumor, or swelling of the part, occasioned by the epiploon's falling into it. See **EXOMPHALUS**, and **ENTARO-EPILOMOPHALUS**.

EPILOON, in *Anatomy*, a fatty membrane, spread over the intestines, and entering even into the feral sinuities thereof; called also the **OMENTUM**, and popularly the *caul*.

The word is formed of the Greek *epi*, *upon*, because it seems to float on the intestines.

EPILOMOPHALUS, compounded of *epi*, *caul*, and *phalos*, *navei*, in *Surgery*, a sort of tumor, or the exomphalus kind. It is formed of the epiploon, and the ileum. See **EXOMPHALUS**.

EPITOROMA, from *epi*, *callus*, a word used, by Hippocrates, and the other old writers, for a callous concretion happening at, and mauling the joint.

EPISCARDIUM, from *epi*, and *cardi*, *flab*, a name given by many of the old authors, to an **ANASARCA**.

EPISCAPHIA, from *epi*, and *scapha*, *boat*, feasts celebrated by the Rhodians.

EPISCENIA, from *epi* and *scena*, *tent*, feasts celebrated by the Lacedæmonians.

EPISCENIUM, *Episcenium*, in *Antiquity*, a place upon the top of the theatre, where all the machines for moving the scenes were kept. Potter, *Archæol. Græc.* lib. i. cap. 8. p. 42.

EPISCESIS, *episcesis*, in *Antiquity*, an action brought to prove the *diastema*, or pretension, that the person detected had left an heir, to be false and groundless. Potter, *Archæol. Græc.* lib. i. cap. 24. tom. i. p. 128.

EPISCIRA, *Episcira*, in *Antiquity*, a festival celebrated at Sicra in Attica, in honour of Ceres and Proserpine. Potter, *Archæol. Græc.* lib. ii. cap. 20. tom. i. p. 395.

EPISCHION, from *epi* and *schion*, *filium*, a name given, by the old Greek writers, to the pube.

EPISCROSIS, *Episcrosis*, the same with *episcris*.

EPISCOPACY, the quality of episcopal government, or that form of church discipline, wherein diocesan bishops are established, distinct from, and superior to, priests or presbyters. See **BISHOP**, **EPISCOPAL**, **EPISCOPALIAN**, and **HIERARCHY**.

Episcopacy, and *presbytery*, have been alternately established and abolished in Scotland.

EPISCOPACIDE, from *episcopus*, *bishop*, and *cide*, *I kill*, the crime of murdering a bishop by one of his own clergy. By the ancient laws of England, the same offence is due from a clergyman to his bishop as from a servant to his master; and therefore the offences of murdering either, are made equal, that is, they are both *petty treason*.

EPISCOPAL, something that belongs to a bishop.

The word is formed of the Greek *episcopus*, *overseer*, derived from *epi*, *super*, *superior*, *superior*, or *superior*.

Episcopal government, is the government of a diocese, wherein one single person, legally consecrated, presides over the clergy of a whole district, in quality of head, or superintendent thereof; conferring order, and exercising a sort of jurisdiction.

The presbyterians reject the *episcopal* establishment, and condemn the *episcopal* order as a human institution, the mere result of pride and ambition.

Among the *episcopal* functions, the principal part is that of holding frequent visitations of the diocese.

EPISCALES valvule, called also, by some, *valvula miltalis*, two valves in the pulmonary vein, which prevent the reflux of the blood to the heart.

EPISCOPALIA, is sometimes used in the same sense with **PONTIFICALIA**.

EPISCOPALIA, is also used to denote synodals, or customary payments, due to the bishops from the clergy of their diocese.

These customary payments have been otherwise called *mon episcopales* and were remitted, by special privilege, to free churches and chapels of the king's foundation, which were exempt from episcopal jurisdiction.

EPISCOPALIAN, or **EPISCOPIST**, a name given to those who adhere to the church of England, and particularly to the ecclesiastical hierarchy, such as it was in the Romish church before the Reformation; who affect the discipline of bishops, priests, canons, the office, or liturgy, &c. and retain the greatest part of the canon law, with the decretals of the pope, more, chiefly than the catholics themselves of several countries; though, as to matters of doctrine, or faith, they agree in most points with the Calvinists, or Reformers.

In Scotland, the principal dissenters are the *Episcopals*; they *Episcopals* enjoy all the same civil privileges with those of the established church. They are under no restrictions; tied to no oaths, but are employed in all places of trust, upon taking the oaths to the government. But the *episcopal* ministers are liable to several penal laws; many of them being nonjurors.

EPISCOPI, *maior*. See **MULTA**.

EPISCOPISSA, a word used by writers of the middle ages, to denote a bishop's wife.

EPISCOPUS, *puerum*, *bishop of the key*, a ludicrous kind of office, formerly exercised in churches, in that called the *fiest of feasts*, or the feast of the kalends.

The custom was for some youth in the feast of Epiphany to plait his hair, that he might seem to have the tonsure, and to put on episcopal garments, and then to exercise a show of jurisdiction, and do several ludicrous actions; for which reason he was called the *bishop of the key*. This custom obtained among us, long after several constitutions were made to abolish it. See **INNOCENT'S DAY**. See diverse curious particulars concerning this *episcopus puerum*, in John Gregory's *Polishness Winks*; and in the *Antiquities of the Cathedral Church of Salisbury*, p. 71.

EPISPEMASIA, from *epi*, *super*, *superior*, in *Medicine*, is the very time that a disease first seizes a person, and is properly called *epispemias*. Blancard.

EPISODE, *Episodes*, from *epi*, *super*, and *odos*, *entry*, is commonly conceived to be a separate incident, story, or action, which an historian, or poet, inserts, and connects with his principal action, to furnish out the work with a greater diversity of events; though, in strictness, all the particular incidents, whereof the action or narration is composed, are called *episodes*.

Episodes, in *Dramatic Poetry*, was the second part of the ancient tragedy.

The origin and use of *episodes* is described by M. Huet, and F. Boileau. Tragedy, in its original, being only a hymn, sung in honour of Bacchus, by several persons, who made a kind of chorus, or concert of music, with dancing, and the like to diversify the representation a little, and divert the audience, they determined at length to divide the singing of the chorus into several parts, and to have something rehearsed in the intervals.

At first, a single person, or actor, was introduced, then two, then more; and what the actors thus rehearsed, or entertained the audience with, being something foreign, or additional to, or beside, the song of the chorus, and no necessary part thereof, was called *episodes*, *episodes*. And hence tragedy came to consist of four parts, the *prologue*, *episodes*, *exode*, and *chorus*. The *prologue* was all that preceded the first entrance of the chorus. The *episodes*, all that was interposed between the singings of the chorus. The *exode*, all that was rehearsed after the chorus had done singing. And the *chorus*, was the *grego*, or company, that sang the hymn.

And as this recitation of the actors was in several parts, and inserted in several places, it might either be considered together as a single *episodes*, consisting of several parts; or each part might be called a distinct *episodes*.

These several *episodes* in the same tragedy might either be taken from so many different subjects, or from the same subject divided into a proper number of recitations, or incidents.

To consider only the first occasion, and indistinctness of these foreign, or additional pieces, it appears no ways necessary, that they should all be taken from one and the same subject; three or four recitations of different actions, no wife related, or connected to each other, would ease the actors, and amuse the people, in the intervals of the chorus, as well as if they were all so many parts of the same action. By degrees, what was at first only an addition to the tragedy, became the principal part thereof. Then the several pieces, or *episodes*, began to be considered as one single body, which was not to have parts, or members of different nature, and independent of each other.

The best poets took the thing in this light, and drew all their *episodes* from the same action; which practice was so fully established in Aristotle's time, that he lays it down as a rule. Those tragedies wherein this unity and connexion were not observed, he calls *episodes pieces*.

EPISODE,

EPITHETON, in *Epic Poetry*. The term *epithet*, by being translated from the flag to the *epithet*, did not change its nature. All the difference Aristotle makes between the tragic and epic *epithet*, is, that the latter are more ample than the former.

Aristotle uses the word in three different senses: the first taken from the enumeration already made of the parts of the tragedy, viz. *prologue*, *chorus*, *epithet*, and *exode*. Whence it follows, that in tragedy, every thing is *epithet* that is none of the other parts; so that as, among us, there are tragedies without either *prologue*, *chorus*, or *epithet*, the tragic *epithet* includes the whole tragedy; consequently the epic *epithet* must be the whole poem, in like manner; all there is to trench on it being the proposition, and invocation, which stand in lieu of the prologue. In this sense, the epics, and tragedy, have each only one *epithet*; and if the parts, or incidents, be all connected together, the poem will be *epithet*, and defective.

But farther, as all that was sung in the tragedy was called the *chorus*, in the singular number, yet this singularity did by no means prevent every part or division of the same from being called a *chorus*, without making several *choruses*; so it was with the *epithet*; each incident, and part of the fable and action, is not only a part of the *epithet*, but is an *epithet* itself.

The term *epithet*, therefore, in this sense, signifies every part of the action expressed in the plan, or first draught, of the fable; as the absence and wanderings of Ulysses, the disorders in his family, and his presence, which restricted and set all to rights again.

Aristotle furnishes us with a third kind of *epithet*; in showing that what is contained and expressed in the first plan of the fable is proper, and that all the rest is *epithet*.

By *proper* he means what is absolutely necessary; and by *epithet* what in one sense is necessary, and in another not, so that the poet is at liberty to use, or let it alone. Thus, Homer, having made the first draught of the fable of his *Odyssey*, was not at liberty either to make Ulysses absent from his country, or not. His absence was essential; and therefore Aristotle ranks it among the things he calls *proper*. But he does not bestow that appellation on the adventures of Antiphates, Circe, the Sirens, Scylla, Charybdis, &c. The poet was at liberty to have left these alone, and to have chosen others in their room; so that they are *epithets*, distinct from the first action, to which they are not immediately necessary.

This third sense of the word *epithet* comes to the second: all the difference between them is, that what we call *epithet*, in the second sense, is the ground, or plan, of the *epithet* in the third; and that the third adds to the second certain circumstances which are only probable, and not necessary, as the places, princes, and people, among whom Ulysses was cast by Neptune.

It must be added, that in an *epithet* in the third sense, the incident, or *epithet* in the first sense, wherein it is grounded, is to be extended and amplified; otherwise, an essential part of the action and fable does not become an *epithet*.

Lastly, it is in this third sense that we are to understand that precept of Aristotle, not to make the *epithets*, till after the names of the persons have been chosen. Homer would not have spoken of the fleets and ships as he has done, if, in lieu of the names of Achilles, Agamemnon, and Iliad, he had chosen those of Adrastus, Capaneus, and Thebaid.

Upon the whole, the term *epithet*, in the epic poem, as used by the father of the critics, Aristotle, does not signify any foreign, or accidental feature. But the whole narration of the poet, or a necessary and essential part of the action and subject, amplified with probable circumstances.

Thus Aristotle enjoins, that the *epithet* be not added to the action, or fetched from elsewhere; but that it be a part of the action; and never uses the word *add up*, in speaking of *epithets*, though it occurred so naturally to his interpreters, that they have generally used it in their translations and comments. He does not say, that after laying the plan, and choosing the names, the poet is to add the *epithets*; but uses a derivative of the word *epithet*, *enveloping*, as if in English we should say, *epithetify* his action.

From what has been said, we may venture to define *epithet* to be necessary parts of the action, extended and filled up with probable circumstances. Now an *epithet* is only a part of an action, and not a whole action; and this part of the action, which is the base, or ground of the *epithet*, must not, when *epithetified*, retain any thing of the simplicity which it had when first expressed in general, in the plan of the fable.

The subject of a poem may be lengthened two ways; ei-

ther by the poet's making use of a great many of his *epithets*; or by his amplifying, and giving a greater extent to every one. By this latter method, chiefly, it is, that the epic poets lengthen their poems much beyond the dramatic. It must be added, that there are certain parts of an action, which, of themselves, do not naturally present or afford more than one *epithet*; such as the death of Hector, of Turnus, or the like; whereas there are other parts of the fable more copious and fertile, and which oblige the poet to make diverse *epithets* on each, though laid down in the first plan with as much simplicity as the rest; such are, the battles of the Trojans and Grecians, the absence of Ulysses; the wanderings of Aeneas, &c. For Ulysses's absence to many years from his own country, required his presence elsewhere; and the design of the fable was to throw him into several dangers, and different countries. Now each peril, and each new country, furnished an *epithet*, which the poet might use, if he pleased.

The rest of the whole is, that *epithets* are not actions, but parts of actions; that they are not added to the action and matter of the poem, but make the action and matter themselves, as the members make the body; that, of course, they are not to be fetched from elsewhere, but raised from the ground, or basis, of the action; that they are not united and connected with the action, but with one another; that all the parts of an action are not so many *epithets*, but only such as are amplified, and extended with particular circumstances; and, lastly, that their union with each other is necessary in the ground of the *epithet*, and probable in the circumstances.

EPISODIC, in *Poetry*. A fable is said to be *episodic*, when it is swelled with unnecessary incidents; and its episodes are not necessarily, nor properly, connected with each other.

Aristotle lays it down, that those tragedies are most defective, whose episodes have no connection, or dependence on each other, which he calls *epithet*, q. d. *superabundant in episodes*; because to many little episodes can never compose one whole, one, but necessarily remain in a vicious plurality.

If an episode be used, the names and circumstances whereof are unnecessary, and whose ground and subject make no part of the action, that is of the matter of the poem, such an episode renders the fable *episodic*. This irregularity is discovered, when one may take away a whole episode, without substituting any thing in its room; and yet leave no chasm, or defect, in the poem. The history of Hypsipyle, in Statius's Thebaid, affords an instance of these faulty episodes. If the whole story of that illustrious nurse were retrenched, the sequel of the principal action would be the better for it. Nor would any body imagine he had forgot any thing, or that there was any member of his action wanting. Boffu, and Aristi. Poet. cap. 9.

EPISPAS TIC, formed of *em* and *spas*, *trache*, I draw, in *Medicine*. See BLISTER.

EPISPHERIA, from *em* and *sphaera*, a sphere, in *Astronomy*, are windings and turnings in the outer substance of the brain, that the sanguiferous vessels may pass more securely.

EPISTABE, in *Botany*, a name given to the cuscutha, or dodder, found growing on the plant flabe of the ancient Greeks. See EPITHETOS.

EPISTAPHYLINI, in *Anatomy*, a name given by Winflow, and other of the French authors, to a muscle called by Morgagni, the *oblique superficialis*, and the *aggen evens*, which last name has been continued to it by most authors. Douglas calls it the *oblique superficialis*, and some of the French, the *muscle de la tete*.

EPISTATES, *Epistates*, derived from *em*, *epi*, and *stas*, I stand, in *Antiquity*, a person who has the command and direction of an affair, or of a people.

The term is of considerable use, in speaking of the government of Athens, where the *epistates* was the senator in command for that day, or whose turn it was to preside that day. The constitution was this: the ten tribes of Athens formed by Cleisthenes, elected every year by lot, each of them, fifty senators, which made a senate of five hundred. Every tribe had the precedence in its turn, and surrendered it again successively to another. The fifty senators in office were called *prytanes*; the particular place where they assembled, *prytaneum*; and the term, or duration of their office, viz. thirty-five days, *prytaneum*. During these thirty-five days, ten of the fifty *prytanes* presided weekly, under the name of *proedri*; and of these *proedri* there was one to preside each day of the week, under the title of *epistates*.

No person was allowed to hold his office more than once in his whole life, lest he should acquire too much the taste of dominion: the senators of all the other tribes,

tribes still voted, according to the order the lot had given them; but the *procurator* laid the business before them, and the *epistates* took their votes and opinions. It must be added, that of the ten *procurators*, of each week, there were but seven that would preside, each his day, in quality of *epistates*; the ten *procurators* elected the seven *procurators*.

EPISTEMONARCH, derived from *epistemon*, knowledge, and *arche*, command, a dignitary, in the *Ancient Greek Church*, appointed to watch over the actions of the church, and to inspect or superintend every thing relating to the faith, in quality of a censor. His office answered pretty much to that of *magister sacri palatii* at Rome.

EPISTITES, from *epistimon*, I keep off, in *Natural History*, the name of a stone, described by the writers of the middle ages, as being of a beautiful red, and shining very elegantly. It was renowned for its many magical virtues, according to the idle tradition of those times; they said it drove away all noxious animals, and kept off storms from the place where any one was who had it about him.

EPISTILE, a *LETTER* missive.

The word is formed of *epistolae*, I send.

The term *epistle* is now scarce used, but for letters wrote in verse, and letters dedicatory.

In speaking of letters written by moderns, or rather in the modern languages, we never use the word *epistle*. Thus, we say, the letters, not *epistles*, of the cardinal D'Ossat, of Voltaire, of Bozart, of Howell, of Pope, &c. but those wrote by the ancients, or rather in the ancient languages, we call *epistles*: as the *epistles*, not letters of Cicero, Pliny, Seneca. The *epistle* of St. Paul, St. Peter, St. John, &c. to the Romans, Corinthians, &c.

A TABLE of St. Paul's *Epistles*, in the Order of Time, with the places where, and the Times when they were written.

<i>Epistles</i>	Place	A. D.
1 Thessalonians	Corinth	52
2 Thessalonians	Corinth	52
Galatians	Corinth, or Ephesus	52
1 Corinthians	Ephesus	53
2 Timothy	Macedonia	56
Titus	Macedonia, or near it	56
2 Corinthians	Macedonia	About October 57
Romanus	Corinth	About February 58
Ephesians	Rome	About April 61
2 Timothy	Rome	About May 61
Philippians	Rome	Before the end of 62
Colossians	Rome	Before the end of 62
Philemon	Rome	Before the end of 62
Hebrews	Rome, or Italy	In the Spring of 63

A TABLE of the Seven Catholic *Epistles*, so called because they were written to Christians in general, and the Revelation, with the Places where, and the Times when they were writ.

<i>Epistles</i>	Place	A. D.
The <i>Epistle</i> of St. James	Judea	61 or beginning of 62
The 2 <i>Epistles</i> of St. Peter	Rome	64
St. John's 1st <i>Epistle</i>	Ephesus	About 80
His 2d and 3d <i>Epistles</i>	Ephesus	Between 80 and 90
The <i>Epistle</i> of St. Jude	Unknown	64 or 65
The Revelation of St. John	Patmos, or Ephesus	95 or 96

See Lardner's *Credibility of the Gospel History*, vol. xvi. and vol. xvii.

Learned writers are not absolutely agreed as to the dates of these several *epistles*, nor the places whence they were written. It would lead us too far to examine and produce the various authorities and arguments that have been used for settling these particulars: we shall only mention that Dr. Doddridge dates the 1st *Epistle* to the Corinthians about the year 57; and the 2d *Epistle* in 58; those to the Ephesians, Philippians, Colossians, and Philemon, in 62; the 1st to Timothy, in 58 or 65; the 2d to Timothy, in 66 or 67; the *Epistle* to Titus, between St. Paul's first and second imprisonment at Rome; the *Epistle* of St. James, in 60 or 61; the 1st of Peter in 61; the 2d, in 62; that of St. Jude, some time after the 2d of Peter, according to Dr. Mills, in the year 90. As to the general design of these several *epistles*, it is observed by Dr. Doddridge, who is deservedly esteemed an excellent and useful expositor, that the *Epistle* to the Romans is intended to fix in the minds of the Christians, to whom it is addressed, a just sense of the excellency of the gospel, and to engage them to act in a manner agreeable to their profession of it: the *Epistles* to the Corinthians are designed to resolve some important queries proposed by them, and to correct the various criminal ir-

regularities and disorders, of which they were guilty: the principal design of the *Epistle* to the Galatians was to assert and vindicate the apostle's authority and doctrine, and to confirm the churches of Galatia in the faith of Christ, especially with respect to the important point of justification; to expose the errors that were introduced among them, and to revive those principles of Christianity which he had already taught them. In the *Epistle* to the Ephesians, the apostle endeavours to establish them in the faith; and to this end to give them more exalted views of the divine love and the excellency of Christ; to show them that they were now, though Gentiles, made partakers of equal privileges with the Jews; to encourage them, by his own example and concern for their welfare, and to engage them to the practice of duties becoming their Christian character. The *Epistle* to the Philippians is designed to comfort them under the concern they felt on his account; to check a party-spirit that had broke out among them, and to promote union and affection; to guard them against the seduction of judaizing teachers; to support them under their trials, and to inspire them with an ambition of excelling in ornamental and distinguished attainments. The *Epistle* to the Colossians is designed to excite them to a temper and conduct worthy of their sacred character, and to secure them from the influence of those pagan sophists or Jewish bigots, who endeavoured to seduce them from the purity of the Christian faith. The two *Epistles* to the Thessalonians are intended to confirm them in their adherence to the Christian faith, and to engage them from the sufferings they had already endured, and the extraordinary character they had hitherto maintained, to make great advances, and to excel still more in religion and virtue; and also to rectify some erroneous apprehensions they entertained about the coming of Christ, and to direct them in the proper exercise of Christian discipline. The first *Epistle* of Timothy was partly intended to direct him in managing the affairs of the church, and choosing proper persons for the various offices it required; and partly to caution him against the influence of judaizing teachers, to urge him to pay a constant regard to the interests of practical religion, and to animate him to diligence, fidelity, and zeal. The second *Epistle* prepares Timothy for the sufferings that awaited him, forewarns him of the apostasy that was beginning to appear in the church, and animates him to the persevering discharge of every part of the ministerial office. The *Epistle* to Titus contains a variety of prudential instructions and cautions. The design of the *Epistle* to the Hebrews was to confirm the Jewish Christians in the faith and practice of the gospel, which they might be in danger of deserting through the insinuations or ill-treatment of their persecutors. St. James, in his *Epistle*, aims to correct those errors both in doctrine and practice into which the Jewish Christians had fallen, which might otherwise have produced fatal consequences; and then to establish the faith and animate the hope of sincere believers under their present and approaching sufferings. The *Epistle* of St. Peter are designed to induce the Christian converts in various parts of the world to maintain a conduct inoffensive and amiable; to support them under their trials, and to encourage their constancy, notwithstanding the artifices of false teachers, and the persecution of their most inveterate enemies. The leading design of St. John in his first *Epistle*, is to evince the vanity of faith separate from morality; to inspire the minds of Christians with mutual charity, and to guard them against the snares and efforts of Antichrist, and of all who were envious with his spirit. The *Epistle* of Jude describes the characters of the false teachers, repels the divine judgments which such persons had reason to expect, and thus cautions Christians against being perverted by them. See Doddridge's *Fam. Expositor*, vol. iv. v. and vi. in the general introduction prefixed to each *Epistle*.

EPISTOLARES, among the Romans, under-secretaries to the *magister sacri epistolarii*, or secretary who wrote the emperor's letters. They were thirty-four in number. See *MAGISTER*.

EPISTOLARY, a term used in the phrase *epistolary style*. As the matter of an epistle is the same with that of conversation, it should not differ in the manner of expression; and therefore, all pomp and study of language are not only needless but very improper: the most plain and easy way of conveying our thoughts must certainly be best, as being most natural. Purity in the choice of words, and justness of construction, joined with perspicuity, are the chief properties of this style: to which purpose Cicero observes, that in writing letters we make use of common words and expressions. Ad *Fam. lib. ix. cap. 21*. And Seneca says, I would have my letters be like my discourses, when we either sit or walk together, unstudied and easy. Ep. 75. ad Lucill. However, as the subjects

subjects of epistles are various, they will necessarily acquire some variety in the manner of expression. If the subject be weighty and momentous, the language should be strong and solemn; in things of a lower nature, more free and easy; and upon lighter matters, jocose and pleasant. In exhortations, it ought to be lively and vigorous; in consolations, kind and compassionate; and in advising, grave and serious. In narratives, it should be clear and distinct, in requests, modest; in commendations, friendly, without adulation; in prospers, cheerful and substantial; in adversity, in a word, the style ought to be accommodated to the particular nature of the subject about which it is conversant. Besides, the different characters of the person, to whom the letter is written, requires a like difference in the modes of expression. Superiors should be addressed with respect, inferiors, with courtesy, and equals, with civility. Old men and young, the grave and facetious, courtiers and philosophers, friends and strangers, require some variety in the mode of address. The Epistles of Cicero, the style of which is plain and simple, and yet pleasant and engaging, furnish a proper model in this respect. Ward's Or. vol. ii. p. 213, &c. See **STYLE**.

EPISTOLARY, is sometimes also applied to authors who have wrote epistles or letters. The principal epistolary authors are Sallustius Apollinaris, Tully, the younger Pliny, Seneca the philosopher, Petrarca, Politian, Besequius, Erasmus, Lipsius, Muretus, Alesham, Milton, Petrus, Launoi, Saran, Balzac, Vauvare, &c.

EPISTOMIA, in Anatomy, are the utmost gappings and meetings of vessels.

EPISTOMIUM, *Epistomum*, from *epi*, upon, and *stoma*, mouth, in Hydrostatics, a plug, or instrument, by the application whereof the orifice of a vessel may be opened and shut again at pleasure.

EPISTROPHE, *Epistrophe*, in Rhetoric, a figure wherein that which is supposed of one thing is strongly affirmed of another, and the repetition of the same word occurs at the end of each member or sentence.

Since covered war is left, friendship was left, fidelity was left, liberty was left, all was left. Auct. ad Herenn. lib. ii. cap. 13. See also 2 Cor. ii. 22.

EPISTROPHEUS, in Anatomy, from *epistrophe*, converse, I turn about, the same with *circus*.

EPISTYLE, *Epistyle*, from *epi*, upon, and *styla*, column, in the Ancient Architecture, a term used by the Greeks for what we call architrave, viz. a massive stone, or a piece of wood, laid immediately over the capital of a column.

The *epistyle* is the first or lowest member of the ENTABLATURE.

EPIGRAPH, *Epigrapha*, from *epi*, upon, and *grapho*, I describe, a monumental inscription, in honour or memory of a person deceased, or an inscription engraven or cut on a tomb, to mark the time of a person's decease, his name, family, and usually some eulogy of his virtues or good qualities.

At Sparta, *epigraphs* were only allowed to people who died in battle. Boethius has made a collection of *epigraphs*, not very ample, but exceedingly well chosen. Fa. Labbe has likewise given a collection of the like kind in French, intitled, *Traité des Epigraphes*. Camden, Weaver, and Toldervy, have done something in the same way with our English *epigraphs*.

In *epigraphs*, the dead person is sometimes introduced by way of propitiation, speaking to the living; of which we have a fine instance, worthy the Augustan age, wherein the dead wife thus bespeaks her surviving husband.

*Immatura peris: sed tu, fili mi, amice
Vive tuus, amice optime, vive mater.*

The French have a proverb, *Mentir comme une épigraphe*; *He lies like an epigraph*; an allusion to the eleges ordinarily contained therein, which are not always over-just.

EPIGRAM, is also applied to certain eleges, either in prose or in verse, composed without any intent to be engraven on tombs.

In the Anthologies, or collections of epigrams, we have abundance of such *epigrams*, some of them ludicrous and satirical, others grave. For a specimen, we shall here add a very beautiful one, composed by Mr. Cowley, on himself, to be put in a little country-house, whither he retreated from the court and town to spend his last days.

*Hic, O creator, sub lare parvula,
Concubis hic est cunctis, hic jacet
Diffusus humani laboris
Sarcophagus superaque vitæ;
Non indecora pauperie nitens,
Et non inerti vultu atq;
Vanusq; dilecti populi
Divitiis, animosus hostis.*

VOL. II. N° 116.

*Possit ut illum dicere mortuum,
Quo terrarum nunc quantula sufficit?
Exempta sit curis, victor,
Terra sit illa levis, precare.
Hinc spergellorum spargi heros totas;
Nam vita gaudet mortua paribus;
Hicque aditatis orna
Vati aditu cunctem calentem.*

The following *epigrams*, besides many others, are worth recording. That of Alexander:

Sufficit huic tumulus, curam sufficit orbis.

That of Newton:

*Isaacum Newton
Quem immortalis
Teguntur temporis, Naturæ, Cælum,
Mutilum hic marmor
Fasciat.*

That of Dryden:

Dryden.

Similar to which is that which the Italians have annexed to the Tomb of Tasso:

Lei di Taſſo.

We may also add that of the ingenious and laborious author of this Dictionary, from his tomb in the cloisters of Westminster Abbey, on the north side, written by himself:

*Maurus perorabat,
Pauca natu;
Qui vitam hinc locum et animum,
Nec eruditus, nec idotus,
Litteris editus transiit, sed ut bonis
Qui humani nihil a se alienum putat,
Vita simul et laboribus fuit;
Hic requiescat vultus
EPHRAIM CHAMBERS,
R. S. S.*

Obiit 15 Mayi, 1740.

In English thus:

*Hard of by many,
Known to few;
Who led a life between fame and obscurity,
Neither abounding nor deficient in learning,
Devoted to study, but as a man
Who thinks himself bound to all offices of humanity,
Having finished his life and labour together,
Here desires to rest.
EPHRAIM CHAMBERS.*

EPITASIS, formed of *epi*, upon, and *stasis*, I brighten, in the Ancient Poetry, denoted the second part or division of a dramatic poem, wherein the plot or action proposed and entered upon in the first part or protasis was carried on, heightened, warmed, and worked up, till it arrives at its state or height called the *catastasis*.

This division is laid aside in the modern drama; in lieu whereof our plays are divided into acts. See ACT. The *epitasis* might ordinarily take up about our second or third act.

EPITASIS, in Medicine, denotes the increase or growth and heightening of a disease; or the beginning of a paroxysm, particularly in a fever.

EPITHALAMIUM, *Epithalamium*, formed of *epi*, upon, and *thalamus*, bride-chamber, in Poetry, a nuptial song, or a composition, usually in verse, on occasion of a marriage between two persons of eminence.

The topics it chiefly insists on are the praises of matrimony, and of the married couple with the pomp and order of the marriage solemnity; it concludes with prayers to the gods for their prosperity, their happy offspring, &c. This kind of poetry is very ancient: the fourth Psalm, and the book of Canticles have been considered as specimens of the *epithalamium*. Stesichorus, who flourished in the forty-second Olympiad, has been usually esteemed the inventor of the *epithalamium*, among the Greeks, though it is known that Hesiod composed the *epithalamium* of Thetis and Peleus, a work now lost; but a fragment of which is preserved by an ancient scholiast. Catullus exceeded all antiquity in his *epithalamium*, and the cavalier Marino all the moderns.

Among the Greeks, the *epithalamium* was sung by young men and maids at the door of the bed chamber of the married pair in the evening and morning. The former sort were called *epithalamia singula*, and the latter *epithalamia*. **EPITHEM**, *Epithema*, from *epi*, upon, and *tema*, part, I put, in Pharmacy, a kind of fomentation or remedy, of a spirituous or aromatic kind, applied externally to the regions of the heart, liver, &c. to strengthen and comfort the same, or to correct some intemperature thereof. See FOMENTATION.

There are principally three kinds of these external appli-

tations, the liquid, the solid, and the fat or pulpy kind.

The liquid *epithims* are sometimes considerably thick; but when they are intended to penetrate deep, they are much better if very thin and fluid; and as the part to which the *epithim* is immediately applied is not what it is always intended to act upon, but something lying deep within, the *epithims* intended for this purpose should consist of the most penetrating ingredients; for which reason allingments and insipulating remedies can be of no use in this form, since they cannot be absorbed to deep, and indeed prevent their own ingress by bracing up the mouths of the pores. Hot wine alone is sometimes used as an *epithim*; and frequently such medicines as are not to be taken inwardly, such as highly rectified spirits, preparations of lead, henbane, mandrake, and other poisonous plants, and the like. But we are carefully to remember in regard to these, that the pores are capable of absorbing them, and ought therefore to know the effect they are capable of producing when thus absorbed in the body. As to the vehicles of liquid *epithims*, they are various, such as linen or woollen cloth, silk, flannel, toasted bread, crumb of unstuffed bread; the dry *epithim* or bag, and sometimes the hot liquor, is tied up in a bladder, and that only applied to the part. When a great quantity of the liquor is to be used, flannel flapses do best; but when the heat is to be long retained, and only the finer particles of the liquor admitted, then the bladder performs better and retains beyond all other means. *Epithims* are, in some cases to be applied hot, and in others cold; when the intention is powerfully to resolve, penetrate, and attract, then those of the hot kind are greatly to be preferred; but heat is injurious to parts constricted by intense cold; and those that are cold, or at least tepid, are to be used. Spirituous and volatile liquors are also easily dissipated by heat, and all such ought therefore to be applied either cold, or barely tepid.

The dry *epithims* are medicated powders, usually sewed up in a cloth, and applied to different parts of the body; for this purpose the powders must be coarse, since otherwise their particles would fall through the cloth; and sometimes the liquid *epithims* are added to the dry, to reduce the whole to a consistency, such as may be spread upon cloth.

The ancients used chaff of wood to mix with their powders in the *epithims* of the corner kind, and cotton in those which were finer. Among the dry *epithims* is also to be accounted the use of a bag of hot sand; this is of singular service where heat is to be retained a long time; and sometimes the liquid *epithims* are added to this, its heat being of power to throw them much farther in than they otherwise would reach. The bags in which any of these dry *epithims* are put, must not be filled hard, but only the matter must be lightly put in, that they may remain pliant and spongy. Some make the bags for dry *epithims* of silk, and some of woollen cloth; but linen, which has been much worn, is greatly preferable on all occasions. The figure of the bag is to be accommodated to the part it is to be applied to, and the intention is to be answer. For the head, it is commonly made in the form of a hood; for the forehead, square; for the heart, pyramidal; for the stomach, in form of a shield; for the liver, in form of a crescent; and for the spleen, in shape of an ox's tongue. When the bags are small, it is sufficient to sew up the end when the matter is put in; but when they are large, they must be sewed across in several places in the manner of quilting, to keep the matter equally distributed. When they are thus prepared, they are to be applied either alone, being first warmed, or moistened with any proper liquor. Pigeons applied to the feet are also a sort of *epithim*.

EPITHIMA, castica, epithima castica, a form of medicine prescribed in the late London Pharmacopoeia, and ordered to be made of equal weights of common turpentine and spirit of sal ammoniac. The turpentine is to be kept continually stirring in a mortar, and the spirit gradually drop'd in till the whole is reduced to a white mass.

The spirit of sal ammoniac used in this mixture must not be that made in the common way, but the addition of quick-lime, but with the alkali salt. Pemberton's Lond. Disp. p. 377.

EPITHESES, in Surgery, a word used by some writers to express the reducing or rectification of crooked limbs, by means of proper instruments.

EPITHEI, Epsithi, a noun adjective, expressing some quality of a substantive to which it is joined. The word is formed of *epi*, upon, and *thei*, setting, putting. As a fruitful vine, a fluted pile, an echoing vault, &c. *Epithets* are of great use and convenience among poets

and orators, who supply in *epithets* what they want in other requisites. Card. Perron even blames Homer on the head of *epithets*, observing, that he frequently backs in *epithets* without any sense or significance at all, to help out his measures; and that he equips every hero with an *epithet*, not according to the exigence of the case, but the measure of the verse.

EPITHET, is also used for a surname, or a person's second appellation.

Epithets were anciently bestowed very freely, either on account of excellencies or defects of the body or mind; king's themselves were not exempted from them. Hence those of them so frequent in history, as Edward the Confessor, Richard Coeur de Lion, Edmund Ironside, Richard Crook-back, John Lack-land, &c.

Nor have the French used their kings any better, as we see in their Charles the Simple, Louis the Lazy, Louis (Ludovicus nihil faciens), Pepin the Short, Louis the Stammerer, &c.

EPITHRACADIA, in *Antiquity*, a festival in honour of Apollo.

EPITHYME. See DODDER, and EPITHYOS.

EPITOME, an *abridgement*, or reduction of the principal matters of a larger book into a little compass. See ABRIDGMENT.

The word is Greek, *epithymos*, formed of *epithymos*, *reducere*, to reduce, *abridgere*, or cut off.

The *Epitome* of Damius's *Annals* is done by Dr Spence (Spensmann). Bioner has given an *Epitome* of the philosophy of Galenus.

It is a popular objection against the *epitomizing* of authors, that it frequently occasions the loss of the original. Thus the loss of the historian Trogus Pompeius is attributed to his epitomizer Justin, and the loss of a great part of Livy to Luc. Florus.

EPITHITES, from *epi* and *titos*, *titus*, in *Proleg.* a foot consisting of four syllables, three long, and one short.

Grammarians reckon four species of *epithites*; the first, consisting of an iambus and spondee, as *antiphras*; the second, of a trochee and spondee, as *concordia*; the third, of a spondee and an iambus, as *communis*; and the fourth, of a spondee and trochee, as *facultas*.

EPITHITES, among the Greek *Alphabets*, denoted a ratio, called also the *sesquialteral ratio*, the same with that of 2 to 3.

EPITROCHASMUS, in *Rhetoric*, a figure wherein we slightly pass over several things of great moment, by only mentioning them in general. Such is the saying of Cæsar, *Peri, vidi, vici*.

EPITROPE, in *Rhetoric*. See CONCRETION.

EPITROPUS, a kind of judge, or rather an arbitrator, which the Greek Christians under the dominion of the Turks elect in the several cities to terminate the differences that arise among them, and avoid carrying them before the Turkish magistrates. See ARBITRATOR.

There are several *epitrops* in each city. Mr. Spence, in his *Travels*, observes, that at Athens there are eight chosen out of the several parishes, and called *nichilarii*, i. e. old men. But Athens is not the only place where there are *epitrops*; they are in all the islands of the Archipelago. Some Latin authors of the sixth century call *epitrops* those who more anciently were called *colles*, and since *vicarii*.

In times still earlier, the Greeks used the term *epitrops*, in the same sense as the Latins did *procurator*, viz. for a commissioner or intendant.

Thus the commissioners of provisions in the Persian army are called by Herodotus and Xenophon *epitrops*. In the New Testament, *epitrops*, denotes the steward of a household, translated in the *Vulgate* *procurator*.

EPIZEUXIS, in *Rhetoric*, a figure where the same word is repeated in the same sense, without any others intervening, and suited to express urgent surprise, sorrow, and several other passions: thus *epi, epi, adflect, adflect*, and that of Virgil, *mon, mon, non refragare remis*, are instances of it. See MATTHEW xiii. 57.

EPLOYE, in *Horology*, An eagle *eployé* is what in English we more usually call an eagle displayed, or a spread eagle. See DISPLAYED.

EPNEUMATOSIS, from *epneuma*, *Terebinti*, in *Medicine*, the same with EXPIRATION.

EPOROLIA, in *Antiquity*, a fine laid upon those that could not prove the indictment they had brought against their adversaries.

It was so called, because they were obliged to pay the sixth part of the value of the thing they contended for, viz. an obolus out of every drachm. Some of these fines were deposited in all law-suits, a very few excepted, before the trial could proceed. Potter, Archæol. Græc. lib. i. cap. 21. tom. i. p. 117.

EPOCHA, in *Chronology*, a term or fixed point of time, whence the succeeding years are numbered or accounted.

The word is *epocha*, q. d. *exhibet, repræsentat*, formed of *epo*, to sustain, *epo*, because the *epocha* defines or limits a certain space of time.

Different *epochas* obtain in different nations; and no wonder; for there being no astronomical consideration to render one preferable to another, their constitution is purely arbitrary. That principally regarded among Christians, is, the *epocha* of the Nativity or incarnation of Jesus Christ; that of the Mahometans, the *Hegira*; that of the Jews, *see*, the *Creation of the World*; that of the ancient Greeks, the *Olympiads*; that of the Romans, the *Building of the City*; that of the ancient Persians and Assyrians, the *Epocha* of Nabonassar, &c.

The doctrine and use of *epochas* is of very great extent in chronology.

To reduce the years of one *epocha* to those of another, i. e. to find what year of one corresponds to a given year of another; a period of years has been invented, which, commencing before all the known *epochas*, is, as it were, a common receptacle of them all, called the *Julian period*.

To this period all the *epochas* are reduced, i. e. the year of this period wherein each *epocha* commences is determined. All that remains, therefore, is, to add the given year of one *epocha* to the year of the period corresponding with its rise; and from the same to subtract the year of the same period corresponding to the other *epocha*; the remainder is the year of that other *epocha*.

EPOCHA of Christ, or of our Lord, is the vulgar *epocha* throughout Europe, commencing from the supposed time of our Saviour's nativity, December 25, or rather according to the usual account, from his circumcision, that is, from the first of January.

Now, the year of the Julian period wherein Christ was born and circumcised, is usually computed to be the 4713th; consequently, the first year of the *era* of Christ corresponds to the year 4713 of the Julian period.

Hence, 1. If to any given year of Christ you add 4713, the sum will be the year of the Julian period corresponding thereto. E. g. If to the year 1779 be added 4713 the sum 6492 is that year of the Julian period.

2. On the contrary, subtracting 4713, from any given year of the Julian period, the remainder is the current year of Christ. E. g. From the year of the Julian period 6492 subtracting 4713, the remainder is the year of Christ 1779.

In effect, the *epocha* of our Lord serves not only for the computation of the years elapsed since the *epocha* commenced, but even of those before it.

Now, to find the year of the Julian period corresponding to a given year before Christ, subtract the given year from 4713; the remainder is the correspondent year requested. Thus, e. g. the year before Christ, 752, is the year 3961 of the Julian period. On the contrary, subtracting the year of the Julian period from 4713, the remainder is the year before Christ.

The author of the vulgar *epocha*, or way of computing from Christ, is an abbot of Rome, one Dionysius Exiguus, by nation a Syrian, who flourished under Justinian about the year 507, or, according to others, 527, though this Dionysius borrowed the hint from Panodorus, an Egyptian monk. Till his time, the generality of Christians computed their years either from the building of Rome, or according to the order of the emperors and consuls, and other ways in use with the people among whom they lived.

This diversity occasioning a great distraction between the churches of the East and West; Dionysius, to compose the same, first proposed a new form of the year, with a new general *era*, which in a few years time was generally admitted.

Dionysius began his account from the conception or incarnation, by us popularly called *Easter day*, or the *Annunciation*; which method obtained in the dominions of Great Britain till the year 1752, before which time the Dionysian and English *epochas* was the same; but in that year the Gregorian calendar having been admitted by act of parliament, they now reckon from the first of January, as they do in the other countries of Europe, except in the court of Rome, where the *epocha* of the incarnation still obtains for the date of their bulls.

It must be added, that this *epocha* of Dionysius is charged with a mistake: the common opinion is, that it places our Saviour's nativity a year too late; or that he was born the winter preceding the time prescribed by Dionysius for his conception.

But the truth is, the fault lies on Beda, who misinterpreted Dionysius, and whose interpretation we follow, as has been shewn by Petavius from Dionysius's own epistles; for Dionysius began his cycle from the year 4712, but his *epocha* from the year 4713, wherein the vulgar *era* supposes Christ to have been incarnate.

The year, therefore, which, according to the vulgar *epocha*,

is the first year of Christ, according to Dionysius's *era*, is the second; so that the year which we call 1779, should, in justice, be 1780, though some chronologists, instead of one year, will have the error two.

Others suppose that the Dionysian *era* is four years too late; which supposition is confirmed by considering that our Saviour was born before the death of Herod; and according to the testimony of Josephus, lib. xviii. cap. 18. there was an eclipse of the moon in the time of Herod's last illness; which eclipse appears to have happened in the year of the Julian period 4710, March 13, at Jerusalem. Now, as our Saviour must have been born some months before Herod's death, since in the interval he was carried into Egypt, the last time in which we can fix the true *era* of his birth is about the end of the 4709th year of the Julian period. Perg. Abr. p. 260. To this vulgar *era*, as a fore fixed point, chronologists have been accustomed to reduce all the other *epochas*, though there is not one of them but what is converted; so much uncertainty there is in the doctrine of time. We shall exhibit them as reduced to the Julian period.

EPOCHA of the Christian, or of our Lord, according to the computation of the Jews, called also the Jewish *epocha*, is the year of the Julian period 953, answering to the year before Christ 3761, and commencing on the seventh day of October. Hence subtracting 953 years from any given year of the Julian period, the remainder is the year of the Jewish *epocha* corresponding thereto. Thus, e. g. the year 1779 being the 6492nd year of the Julian period, it is the 5543th year of the Jewish *epocha*, or since the creation of the world.

This *epocha* is still in use among the Jews.

The EPOCHA of the Christian, used by the Greek historians, is the year before the Julian period, 787, answering to the year before Christ 5500.

Hence, to any given year of the Julian period, adding 787, the sum gives the year of this *epocha*. E. g. 1779 being the 6492nd year of the Julian period, 1779 is that year of this *epocha*, or the year of the world according to this computation.

The author of this *epocha* is Julius Africanus, who collected it from the historians; but when it came to be admitted into civil use, 8 years were added to it, thus for every year thereof divided by 85 might exhibit the number 1005, which the eastern emperors used in their charters and diplomas.

The *epocha* of the creation used by the latter Greeks and Russians is the year 795 before the Julian period, or the year 5508 before Christ, commencing from the first day of September. Though the Russians having lately admitted the Julian calendar, begin their year from the first of January.

Hence, adding 795 to the year of the Julian period, the sum gives the year of this *epocha*. Thus, e. g. the Julian period of the year 1779 being 6492, that year of this *epocha*, i. e. the years from the creation on this footing are 7287. Again, from that year 7287 subtracting 5508, the remainder is the year of the common *era* 1779. This *era* was used by the emperors of the East in their diplomas, &c. and thence also called the *civil era* of the Greeks. In reality, it is the same with the *epocha* of the Constantinopolitan period; whence some call it the *epocha* of the period of Constantinople.

The Alexandrian EPOCHA of the creation is the year 780, before the Julian period, answering to the year before Christ 5493, and commencing on the 25th day of August.

Hence, adding 5493 to the year of Christ 1779, the sum 7272 gives that year of this *epocha*, or years elapsed since the creation, according to this computation.

This *epocha* was first conceived by Panodorus, a monk of Egypt, to facilitate the computation of Easter; whence some call it the *Greek ecclesiastical epocha*.

The Egyptian EPOCHA of the creation, is the year of the Julian period 486, answering to the year before Christ 4248, and commencing in autumn.

Hence, subtracting 486 from the year 6492 of the Julian period, or adding 4248 to the year of Christ 1779, the result 6006 will be that year of this *epocha*.

This *epocha* is used in Eusebius's Chronicon, and the Roman Martyrology.

The EPOCHA of the Christian, according to Mr. Bessel and Mr. Kennedy, is the year of the Julian period 706, answering to the year before Christ 4607; but it must be allowed, that all the *epochas* of the creation are uncertain. See Strachius's, Brev. Chron. by Sante p. 157, &c.

EPOCHA of the Olympiads, is the year of the Julian period 3938, answering to the year 775 before Christ, and the year 3232 from the creation, commencing at the full moon next the summer solstice, and each Olympiad containing four years.

This *epocha* is very famous in ancient history; it was

altar, after all the turns and returns of the strophe and antistrophe.

The *epode* was not confined to any precise number, or kind of verses; as the strophe and antistrophe were. But when the ode contained several *epodes*, strophes, &c. they were all stichs.

As the word *epode*, then, properly signifies the end of the song; and as in odes, what they called the *epode*, finished the singing, it became customary, as M. Dacier shews, for any little verse, which, being put after another, closed the period, and finished the sense which had been suspended in the first verse, to be called *epode*, *epodeion*. And hence it is, that the sixth book of Horace's Odes is entitled *Libri Epodici*, *Book of Epodes*, because the verses thereof are all alternately long and short; and the short ones, generally, though not always, close the sense of the long one. But the signification of the word is extended still farther; *epode* being become a general name for all kinds of short verses, that follow one or more long ones; and in this sense, a pentameter is an *epode*, after an hexameter, which in respect thereof is a prode.

EPIDOS, from *epi*, *upon*, and *idos*, *long*, in *Medicine*, a word used to express the curing of diseases by incantation.

EPOICODOMESIS, from *epoikos*, *I build upon*, in *Rhetoric*, is sometimes used for what is otherwise called *epitaph*.

EPOMIS, *Epomis* in *Antiquity*, the upper part of the shoulder, reaching up to the neck.

The word is Greek, *epomis*, which primarily signifies a short cloak or mantle made to cover the shoulders.

Some authors apply the word *epomis* to the upper part of the os humeri; but the ancient Greek physicians only use it for the muscular, or fleshy part, placed as above mentioned. See *DEUTERON*.

EPOMPHALION, from *epi*, *upon*, and *omphalos*, *navel*, any medicine which purges, on being applied to the navel.

EPOPOEIA, *Epopoia*, in *Poetry*, the history, action, or fable, that makes the subject of an epic poem.

The word is derived from the Greek *epos*, *carmen*, *verse*, and *poia*, *facis*, *I make*.

In the common use of the word, however, *epopoia* is the same with *epos*, or *epic poem* itself; in which sense it is defined a discourse invented with art, or a fable agreeably imitated from some important action, and related in verse, in a probable and surprising manner; with a view to form the manners, &c. See *ERIC PETER*.

EPOPS, in *Ornithology*, a name by which some of the ancient writers have called the bird we call the *upupa*, or *noctua*.

EPOSILINGA, a word used, by some chemical writers, to express the scales which fly off from iron, when hammered at the smith's forge.

EPOTTIDES, in the *Ancient Ship-Building*, two large thick pieces of wood on each side of the prow of a galley, which resembled two ears, whence they had their name.

The *epottides* were chiefly designed to ward off the blows of the masts of the enemies vessels.

EPOMI *salt*. What we now direct with, in the shops of chemists, under this name, is no other than a salt made from the bittern, or remaining brine, after the making of common salt; but when the world was first made acquainted with a purging salt under this name, it was truly what its name expressed, being really made from the purging waters of that place. This salt is bitter, and of a strongly purging quality, and, when suffered to shoot freely, and its crystals at a due distance, it always formed them into rectangular prisms, with four parallel grammic planes; by this, and by divers other properties, it appears evidently different from all other salts known at that time. It was supposed to partake of the nature of alum, and the waters of the place were called *aluminous waters*; but Dr. Grew has evidently proved the error of that opinion; and others supposed this salt the same thing with the salt of lime, or the nitre of old walls, but this was equally erroneous. The best method of taking it was found to be dissolving it in a proper quantity of its own waters; by this means the water was made to work both more quickly and more effectually; and it proved of great service in disorders of the stomach, as want of appetite, and the like; and in colic, diabetes, the fever, and rheumatism, and many other chronic diseases. Phil. Trans. N° 216, p. 76.

Mr. Bouldue has given much the same description of the manner of making *Epomi salt*, as Mr. Brown had done in Phil. Trans. N° 337, § 10. and N° 328, § 11. that it is the salt which crystallizes, after boiling to a due consistence the bittern, which is the liquor remaining in the salt-pan, after the sea-salt is separated. See Mem. Acad. Scienc. 1731.

EPOMI *water*. This is a water easily imitated by art, i. e. by only dissolving half an ounce of *Epomi salt* in a quart of pure water, made somewhat brisk or quick by a few drops.

Vol. II. N° 116.

of spirit of vitriol and oil of tartar, so as to let the alkali prevail. Shaw's Lectures, p. 90.

PTACTIS, in *Natural History*, a name given by Linkius, and some other authors, to a species of flat-fish, of the *cyprinoid* kind, whole rays, or branches, at their first going out from the body, are only seven in number; but which very soon spread into more. See *STAR-FISH*.

EPULÆ. See *ENTERTAINMENTS*.

EPULARES, in *Antiquity*, an epithet given to those who were admitted to the sacred *epulae* or entertainments, it being unlawful for any to be present at them who were not pure and chaste.

EPULENT *medicines*, the same with *discurantia*. See *CLASTIC*.

EPULIDES, from *epi*, *upon*, and *idula*, *the gums*, in *Surgery*, certain fleshy tubercles, or excrescences of the gums; these are of two kinds, some being of a mild nature, others painful, malignant, and inclining to be cancerous. Surgeons distinguish them also into the larger and the smaller, and the harder and softer; they are sometimes supported by a broad, sometimes by a narrow root. These excrescences not only deform the mouth, but hurt the speech and mastication, and are always best speedily extirpated.

When they grow to a small root, they are best extirpated by ligature, or tying a thread firmly about the root; but when the root is broad, they are best eaten off by caustics, as the oil of tartar, spirit of sal ammoniac, and the like; and when these mild ones prove infectious, it is best not to have recourse to stronger, but to raise the tubercle with the hook or plectrum, and carefully extirpate it with the knife, not cutting off the gums, so as to uncover the roots of the teeth, which would be probably attended with a caries of the bone. The blood should be permitted to flow from these for some time; but if the hemorrhage continue too long, the patient must wash his mouth with hot red wine, with alum dissolved in it, repeating it till it ceases; and afterwards a mixture of myrrh, and honey of roses, should be used, till the parts are perfectly well; and if the tubercles should sprout up again, they should be taken down in time by the same methods. Heister's Surgery, p. 462. See also Scheelhammer, De Epulide. See *GUM-BALL*.

EPULIS, *gum*, in *Antiquity*. See *GUMIVA* and *MOUTH*.

EPULO, in *Antiquity*, the name of a minister of sacrifice among the Romans.

The pontifices, not being able to attend all the sacrifices, performed at Rome, to so many gods, as were adored by that people, appointed three ministers, whom they called *epulones*, because they conferred on them the care and management of the *epulae*, feasts in the solemn games and festivals.

To them belonged the ordering and serving the sacred banquet, offered on such occasions to Jupiter, &c. They wore a gown bordered with purple, like the pontifices. Their number was at length augmented from three to seven, and afterwards by Cæsar to ten.

Their first establishment was in the year of Rome 558, under the consulate of L. Furius Purpureo, and M. Claudius Marcellus.

EPULONES. See *EPULO*.

EPULOTICS, *Excorians* in *Medicine*, drying, astringent, remedial, proper to harden, cicatrize, and incarnate wounds, and ulcers.

The word is formed of the Greek *epi*, *super*, and *anol*, *coactrix*, *ipho*; whence the verb *excoriare*, *scabrum inferre*, *I contract*.

Such are emplasters of cerufs, and diapalma; the unguent of pompholyx, &c.

EPULUM, in *Antiquity*, banquet, a holy feast prepared for the gods.

The statues of the gods were commonly laid upon a bed, and served in the *epulae* as if they had been very hungry, to perform which, was the function of the ministers of sacrifice, hence called *epulones*.

EQUABLE *motion*, is that whereby the moveable body proceeds with the same continued velocity; neither accelerated nor retarded.

EQUABLE *pulse*. See *PULSE*.

EQUABLE *style*. See *STYLE*.

EQUAL, a term of relation between two or more things of the same magnitude, quantity, or quality.

Wolffius defines *equal* to be those things which may be substituted for each other, without any alteration of their quantity. It is an axiom in geometry, that two things which are equal to the same third, are also equal to each other. And again, if, to or from *equal*, you add or subtract *equal*, the sum or remainder will be equal.

EQUAL *circles*, in *Geometry*, are those whose diameters are equal. See *CIRCLE*.

EQUAL *angles*, are those whose containing lines are inclined

alike to each other; or which are measured by similar arches of their circles.

EQUAL ARCHES. See ARCH.

EQUAL FIGURES, are those whose areas are equal; whether the figures be similar, or not.

The segments of a sphere, or circle, are of an *equal convexity*, or *concavity*, when they have the same ratio, or proportion to the diameters of the spheres, or circles, whereof they are parts.

EQUAL SOLIDS, are those which comprehend, or contain, each as much as the other; or whose solidities, or capacities, are equal. See SOLID.

EQUAL HYPERBOLAS, are those, all whose ordinates to their indeterminate axes, are equal to each other, taken at equal distances from their vertices.

EQUAL LINES. See HOMO.

EQUAL GEOMETRICAL RATIOS, are those whose least terms are similar, aliquot, or aliquant parts of the greater.

EQUAL ARITHMETICAL RATIOS, are those wherein the difference of the two less terms is equal to the difference of the two greater. See RATIO.

EQUAL, in OPTICS. We say, that things seen under equal angles, are equal. Equal parts of the same interval, or magnitude, if unevenly distant from the eye, appear unequal. Equal objects, and at equal distances, only the one placed directly, and the other obliquely, seem unequal; and that placed directly, the bigger.

Masonry is *EQUAL CARSEL*. See MASONRY.

EQUALITY, in ASTRONOMY. Circle of EQUALITY, or the *equinoctial*. See CIRCLE and EQUANT.

EQUALITY, ratio, or proportion of, in Geometry, is that between two equal numbers, or quantities.

Proportion of EQUALITY equally changed, or ex æquo ordinata, is that wherein two terms in a rank, or series, are proportional to as many terms in another series, compared to each other in the same order, i. e. the first of one rank to the first of another; the second to the second, &c.

Proportion of EQUALITY equally disturbed, called also ex æquo perturbata, is that wherein more than two terms of a rank, are proportional to as many terms of another compared to each other, in a different and interrupted order; viz. the first of one rank to the second of another; the second to the third, &c.

EQUALITY, in ALGEBRA, is a comparison of two quantities, that are equal both really, and representatively, i. e. which are so both in effect and letters.

A comparison of two quantities, equal in effect, but unequal in letters, to render them equal, is called an *equation*.

EQUALITY, in ALGEBRA, is usually denoted by two parallel lines, as =; thus, 2 + 2 = 4, i. e. 2 plus 2, are equal to 4. This character was first introduced by Harriot. Des Cartes, and some after him, in lieu thereof, use ∞; thus, 2 + 2 ∞ 4; for 2 + 2 ∞ 4 + 0, signifies that 2 minus 0, is equal to 2 plus 0.

From an equation we arrive at an *equality*, by changing an unknown letter into another, whereby the two members of the equation, i. e. the two quantities compared together, and connected by the sign of equality, are rendered equal.

Thus, in the equation $ax = bcd$; supposing $x = \frac{bcd}{a}$,

we change x into $\frac{bcd}{a}$, and by this substitution arrive at the equality $bcd = bcd$.

In the solution of a numerical problem, which is to be rendered rational, if there be only one power to be equalled to a square, or other higher power, it is called *single equation*.

When there are two powers to be equalled, each to a square, it is called *double equation*, &c.

Diophantus hath given us a method for *double equalities*, and F. de Billy, another for *triple equalities*, in his *Diophantici Redivivus*.

EQUALITY, union of. See UNION.

EQUALITY, in LAW, the law delights in equality; so that when a charge is laid upon one, and divers ought to bear it, he shall have relief against the rest. 2 Rep. 25.

EQUANIMITY, in Ethics, denotes an even, uniform temper of mind, amidst all the vicissitudes and revolutions of time and chance. This virtue, together with prudence, forms the character which Horace gives of Aristippus:

Omnis Aristippum decuit color & status & res.

EQUANT, or EQUANT, in ASTRONOMY, a circle, formerly imagined by astronomers, in the plane of the deferent, or eccentric; for regulating and adjusting certain motions of the planets, and reducing them more easily to a calculus. See APOGEE, CIRCLE, DEFERENT, and ECCENTRIC.

EQUATED ANIMALS. See ANOMALY.

EQUATED RADII. On Gunter's *sector* there are forty times placed two lines, answering to one another, and called the *lines of equated radii*; they lie between the lines of solids and superficies, and are noted with the letters D, I, C, S, O, T, for dodecahedron, icosahedron, cube, sphere, octahedron, and tetrahedron.

The use of these lines are, 1. When the diameter of the sphere is given, to find the sides of the five regular bodies, severally equal to that sphere. 2. From the side of any of the bodies being given, to find the diameter of the sphere, and the sides of the other bodies, which shall be equal severally to the first body given.

If the sphere be first given, take its diameter, and apply it over in the sector in the points S, S; if angles or ordinates be first given, apply the side of it over in the points S; so the parallel taken from between the points of the other bodies, shall be the sides of those bodies, &c. all severally to the first body given.

EQUATION, or EQUATION, in ALGEBRA, an expression of the same quantity, in two different, that is, dissimilar, but equal terms or denominations.

As, when we say, $2 \times 3 = 4 + 2$; that is, twice three is equal to four and two.

Stifelius defines *equation* to be the ratio of equality between two quantities differently denominated; as when we say 3 shill. = 36 pence. Or 50 shill. = 2400 pence, = 2400 farth. Or $b = d + c$. Or, $12 = 2 + 10$, &c.

Hence, the resolution of two heterogeneous, or dissimilar quantities to the same value, i. e. to an equality, is called the *bringing them to equation*. See EQUALITY.

The character, or sign of an *equation*, is = or ∞.

The resolving of problems, by means of *equations*, is the business of algebra.

EQUATION, terms of, an, are the several quantities, or parts, of which an *equation* is composed, connected together by the signs + and -. Thus, in the equation $b + c = d$; the terms are b, c, and d. And the tenor or import of the *equation* is, that some quantity, represented by d, is equal to two others represented by b and c.

EQUATION, root of, an, is the value of the unknown quantity in the *equation*. E. g. if $x^2 + b = ax$, the root will be $\sqrt{a^2 + b}$. See ROOT of an *equation*.

Equations are divided, with regard to the power of the unknown quantities, into *simple, quadratic, cubic*, &c.

EQUATION, simple, is that wherein the unknown quantity is only of one dimension, or in the first power. As, $x = a + b$.

EQUATION, quadratic, is that wherein the unknown quantity is of two dimensions, or in the second power. As, $x^2 = a^2 + b^2$.

Quadratic equations are of two kinds, *simple* or *pure*, and *affected*.

Simple, or pure quadratics, are those where the square of the unknown root is equal to the absolute number given; as in $ax = 36$; $ax = 144$; $xx = 133225$.

The resolution of these is easy, it being apparent that nothing more is required than to extract the square root out of the number or known quantity.

Thus the value of a in the first *equation* is equal to 6; in the second $= 12$, and a little more, as being a full root; and in the third example $= 365$.

Affected quadratics, are those which between the highest power of the unknown number, and the absolute number given, have some intermediate power of the unknown number; as, $xx + 2x = 100$.

All *equations* of this rank are in one or other of the following forms; viz. $ax + ax = R$. $ax - ax = R$. $ax + xx = R$.

There are several methods of extracting the roots of *affected quadratics*; the most convenient is that of Harriot. Suppose $x^2 + ax = + b^2$, here x being assumed as a part of the root, a , the known quantity of the second term, will be double the other part, and therefore half of a is the other part. The square thereof will be completed, by adding one fourth of a , which done, the root of the square may be extracted thus:

$$\begin{array}{r} x^2 + ax = b^2 \\ \text{add } \frac{1}{4}a^2 = \frac{1}{4}a^2 \\ \hline x^2 + ax + \frac{1}{4}a^2 = b^2 + \frac{1}{4}a^2 \\ x + \frac{1}{2}a = \sqrt{b^2 + \frac{1}{4}a^2} \\ x = -\frac{1}{2}a + \sqrt{b^2 + \frac{1}{4}a^2} \end{array}$$

In lieu of the characters + and -, we here use points, to avoid the necessity of distinguishing several cases. See REDUCTION of *equations*.

EQUATION, cubic, is that wherein the unknown quantity is of three dimensions; as, $x^3 = a^3 - b^3$, &c.

The second terms of a cubic equation being taken away, they may be all reduced to this form, $x^3 + ax + b = 0$. Where

$$x = \sqrt[3]{-b + \sqrt{b^2 + 4a^3}} + \sqrt[3]{-b - \sqrt{b^2 + 4a^3}}.$$

This rule is commonly ascribed to Cardan, and from him has been called *Cardan's rule*; but it is said by some, that Tartaglia was the inventor, and, by others, Scipio Ferreus, to whom, it is said, Cardan himself ascribes the invention. Legiti. Elem. d'Aritmet. & d'Algebr. p. 479. Wolf. Elem. Math. tom. i. p. 336. edit. 2. and When in a cubic equation, $x^3 - ax + b = 0$, a is negative, Saunderson's Algebra, p. 702. See REDUCTION of equations.

The expression $\sqrt{b^2 + 4a^3}$, will be transformed into $\sqrt{4b^2 - 4a^3}$, which becomes impossible, or imaginary, when $4a^3$ is greater than $4b^2$; for $\sqrt{4b^2 - 4a^3}$ will then be the square root of a negative quantity, which is impossible. And yet, in this case, the root x may be a real quantity; but algebra has not been able to find a real expression of its value. The case is called the *irreducible, irrational, or impracticable case*. See IRREDUCIBLE.

The irreducible case may be solved by the trisection of an arc, for which the reader may consult Saunderson's Algebra, p. 713. This method requires a table of sines; and if such be not at hand, we have recourse to Dr. Halley's universal method of extracting the roots of equations, in the Philosophical Transactions, or in Lowthorp's Abridgement, vol. i. cap. 1. § 20. Vide infra.

There are several other methods of extracting the roots of cubic equations, extant in books of Algebra.

Mr. Cotes observes, in his Logarithm, p. 29, that the solution of all cubic equations depends either upon the trisection of a ratio, or of an angle. See this method explained and demonstrated in Saunderson's Algebra, p. 718.

EQUATIONS, Algebraic, is that we call unknown quantity is of four dimensions; as, $x^4 = a^4 + b^4$. See BIQUADRATIC. Des Cartes gave a method of reducing biquadratic equations to cubic. This method is explained in most treatises of algebra, since his time; and very clearly by the marquis de l'Hôpital in his Conic Sections, art. 156. See also MacLaurin's Algebra, p. 228, seq. See REDUCTION of equations.

Hence a biquadratic equation being proposed, it may be solved, by reducing it first to a cubic equation; and then finding the roots of this new equation, by the trisection of an angle, or of a ratio. These roots, so found, having a given relation to the roots of the proposed biquadratic, will also be given.

EQUATIONS of higher degree. If the unknown quantity in an equation is of five dimensions, it is called a *quintic*, &c. We have no universal rule to express, algebraically, the roots of equations, higher than biquadratic; but such equations may be solved universally in numbers, by Dr. Halley's method of approximation.

This method proceeds by assuming the root desired, nearly true to one or two places; which may be done by a geometrical construction, or by a few trials; and then correcting the assumption, by comparing the difference between the true root and the assumed, by means of a new equation, whose root is that difference, and which he shows how to form from the equation proposed, by substitution of the value of the root sought, partly in known, and partly in unknown terms.

Dr. Brook Taylor found that this method was capable of a greater degree of generality, and that it was applicable, not only to equations of the common form, that is, to such as consist of terms, wherein the powers of the root are positive and integral, without any radical sign, but also to all equations in general, wherein any thing is proposed as given, which by any known method might be computed; as, *vis versa*, the root were considered as given. Such are all radical expressions of binomials, trinomials, or of any other nominal, which may be computed by the root given, at last, by logarithms, whatever be the index of the power of the nominal; as likewise expressions of logarithms, of arches by the sines or tangents, of arcs of curves by the abscissas, or any other fluents, or roots of fluxional equations. See Phil. Trans. N° 352. Jones's Abridg. vol. iv. cap. 1. § 17.

The method of finding the roots of equations by approximation, extends to all kinds of equations; and though it be not accurately, yet it is practically true; as it gives the value sought to a very great degree of exactness, in any assignable degree, if any one will take the pains of computation.

The method of Sir Isaac Newton, and of Mr. Raphson, is, in effect, the same as that mentioned under the head APPROXIMATION. See farther in Newt. Meth. of Flux. and Mr. Colson's Comment. p. 186. But Dr. Halley's

method is more expeditious in practice. See Phil. Trans. N° 216. or Lowthorp's Abridg. vol. i. cap. 1. § 30. The principles of these methods may also be found in Mr. MacLaurin's Algebra, part ii. cap. 9. or in Mr. Simpson's Algebra, p. 147. frq. who gives several formulae for approximating to the roots of equations. This gentleman has also another method for this purpose, which we shall mention farther on.

Mr. Daniel Bernoulli, in the Acta Petropolitana, tom. iii. p. 92. seq. has given a new and ingenious method of approximating to the roots of equations, without any previous trials. The method is deduced from the nature of recurring series. The book wherein it is published being in few people's hands, we shall here give a full account of this method.

Let the proposed equation be put into this form:

$$1 = ax + bax^2 + cx^3 + dx^4 + \&c.$$

Then form a series, beginning with as many arbitrary terms as the equation has dimensions, but with this condition, that if A, B, C, D, E, &c. denote the terms following each other in direct order, then must $B = A + B + C + D + E + \&c.$ and let there be two proximate terms, M and N, in this series sufficiently continued; then will the antecedent M, divided by the consequent N, be nearly equal to the required root.

For instance, let $1 = 2x + 5xx + 4x^3 + 5x^4$. Form a series, beginning with four arbitrary numbers, 1. 1. 1. 1. 1. (as the proposed equation is of four dimensions) and let a new term always be formed from the double of the last preceding taken negatively, more the quintuple of the penultimate, less the quadruple of the antepenultimate, more the pentapenultimate. This series will be 1. 1. 1. 1. 0. 2. - 7. 23. - 65. 341. - 1251. &c. and the approximated root of the equation proposed will be nearly $-\frac{1}{12.51}$.

Again, let $1 = x + 2xx + 3x^3 + 4x^4 + 5x^5$. Form a series, beginning with five arbitrary terms, 1. 1. 1. 1. 1. 15. 29. 71. 153. 477. 1239. 3371. &c. Here $\frac{1}{153}$, or $\frac{1}{213}$, will be nearly equal to one of the roots of the equation.

The root here found is the least of the roots, without attending to the signs; that is, the root so determined is that which is least distant from nothing.

To find the greatest root of a proposed equation, let it be disposed in the following manner:

$$x^m = a^m - b^m + c^m - d^m + e^m - f^m + \&c.$$

Then form a series, beginning with as many arbitrary terms as there are dimensions in the equation; and so that if A, B, C, D, E, &c. denote so many contiguous terms directly following each other in the series, E must be every where $= A + B + C + D + E + \&c.$ Lastly, let there be two proximate terms, M and N, in this series sufficiently continued, then will the consequent term N, divided by the antecedent M, be nearly equal to the required root.

For instance, let us take one of the foregoing equations, the root of which was found to be $-\frac{1}{12.51}$; and let the equation be thus disposed:

$$x^5 = 4x^4 - 5x^3 + 2x^2 - 1.$$

Then form this series,

$$1. 1. 1. 1. 0. - 4. - 15. - 41. - 97. - 309.$$

And $\frac{22}{229}$ will be nearly equal to the greatest root of the proposed equation.

In the application of the rule for finding the least root, the author observes, that some difficulties may arise in two cases. First, when the least root of the equation may be taken either affirmatively, or negatively. Secondly, when the least root is imaginary, as if the equation had these roots, $\sqrt{-4}$, $-\sqrt{-4}$, and 5; of which the last is to be considered as greatest, that is, according to his definition, as farthest distant from nothing.

In the first case, the alternate terms only are to be considered; and if they tend towards a constant ratio, while the contiguous terms deviate, it will arise in equality between the affirmative and negative root. And, in this case, a term in the series must be divided by the alternate term following; and the square root of the quotient will be the root of the equation. For instance, if we had, $1 = -x + 2x^2 + 4x^3$; then forming a series according to the first rule, we shall have 1. 1. 0. 8. - 4. 36. - 20. 128. - 84. 596. - 340. 2388. &c.

And the tenth term 596, divided by the alternate term following, or the twelfth, 2388, gives $\frac{1}{4}$, or $\frac{1}{2}$, nearly equal to the square of the required root, which will therefore be, nearly $\pm\sqrt{\frac{1}{2}}$. This example shews that the rule approximates sufficiently fast; for the number found $\frac{1}{4}$ differs from the truth only by $\frac{1}{2^2}$, the true root being $\pm\frac{1}{2}$. The inconvenience, here mentioned, might also be remedied, by taking $x = \sqrt{2x}$; and then finding the root of the transformed equation by the first rule.

In the second case, when the least root is imaginary or impossible, it is to be considered whether the root will be affirmative or negative: if the former, put $x = y + z$, if the latter, $x = -y + z$. And then the value of y may always be found by the rule: provided that z be assumed greater than x . But though we shall never be disappointed by taking any greater number for z , yet it is to be observed, that the less $z - x$ is, the more easily and quickly will the series tend to the required root. Some circumspection is therefore requisite.

For instance, let $1 = \frac{x+x-x^2}{2}$

If we form a series without any previous examination, such as $1, 1, 1, 1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}, \frac{1}{64}, \dots$

$\frac{12}{128}$, &c. we shall never find any root, as the terms of the series do not tend to any constant ratio. But supposing $x = y - z$ (for it is visible that the negative root cannot be great) we shall have

$$1 = \frac{159 - 77y + 11z}{8}$$

or to avoid fractions, suppose, $y = 8z$, that is, $x = 8z - z$. Then we have

$$1 = 15z - 67z + 11z = 4.42z$$

From this equation the following series arises:

$$1, 1, 1, 1, 23, 353, 4071, 42769, 432151, \&c.$$

$$\text{Hence } z = \frac{42769}{432151}, \text{ and } x = \frac{571150}{432151}$$

For a second example, take this equation.

$$1 = \frac{x - x^2 + x^3}{2}, \text{ from whence this series arises,}$$

$$1, 1, 1, 1, \frac{1}{4}, \frac{5}{8}, \frac{11}{16}, \frac{37}{64}, \frac{91}{256}, \&c.$$

Which gives no root; but taking $x = y + z$ (as it appears that x must be affirmative) this equation will arise, $1 = \frac{10y - 8yz + z^2}{13}$, or rather taking $y = 13z$, that is, $x = 13z + z$, we shall have $1 = 20z - 104z + 169z = 169z$.

This last equation gives the following series:

$$0, 0, 1, 20, 206, 1600, 52776, 1688608, \&c.$$

$$\text{Whence } z = \frac{52776}{1688608}, \text{ and } x = \frac{1270726}{1688608} = 2.00036$$

namely, x being exactly $= 2$.

As to the case before mentioned, of the equality of two roots, it is also to be observed, that a like rule may be applied, where more than two roots are equal, provided they be real. But in case some of these equal roots should be impossible, and the rest real, as if $x^2 - 1 = 0$, where $x = 1$, $x = -1$, $x = \sqrt{-1}$, and $x = -\sqrt{-1}$, all which roots, by our author's definition, are to be considered as equal, or equally distant from nothing: we may obviate this inconvenience, by supposing $x = y + z$, which is therefore an universal remedy.

This will lead us to a method of extracting the roots of powers. For instance, if we wanted the cube root of 2. Then $x^3 = 2$ or $1 = \frac{x^3 - 2}{3}$

The series, formed according to this equation,

$$1, 1, 1, 1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}, \frac{1}{64}, \frac{1}{128}, \frac{1}{256}, \frac{1}{512}, \frac{1}{1024}, \&c.$$

only shews, that $x = 2$. But taking $x = y + z$, the proposed equation will be transformed into the following, $1 = 3y + 3yz + z^2$. From whence this series may be derived.

$$1, 1, 1, 1, 7, 25, 97, 373, 1435, 5521, \&c.$$

$$\text{Therefore } y = \frac{1435}{5521}, \text{ and } x = \frac{5946}{5521} = 1.2597 \text{ nearly.}$$

Again, let it be required to extract the biquadrate root of 20; then $x^4 = 20$, and supposing $x = y + z$, we shall have $1 = 6y + 6yz + 2z^2 + \frac{1}{4}z^4$; from whence this series is obtained.

$$0, 0, 0, 0, 1, 8, 70, 610, 5316, \frac{1}{4}, 46332, \&c.$$

$$\text{This gives } y = \frac{21265}{185328} = \frac{52165}{46332}, \text{ and } x = \frac{21265}{185328}$$

Which root approaches very near to the truth; so that it is much to be doubted whether the same could be obtained so quickly, and so accurately, by any other method.

Suppose again, that the square root of 26 were required. Then $x^2 = 26$. Let $x = y + z$. And $1 = 10y + yz$. Hence we have the series

$$0, 1, 10, 101, 1010, 10301, 104030, \&c.$$

$$\text{Therefore } y = \frac{10301}{104030}, \text{ and } x = \sqrt{26} = \frac{10301}{104030}$$

5.096955380 , differing only by unit from 5.09694913559 found by the common method.

In the case where the greatest root of the equation is required, the like observations may be made, as when we seek the least root, viz. that we may obviate all inconveniences by supposing $x = y + z$. Both methods often take place without any preparation; sometimes only one, and sometimes neither; but this rarely. Both will succeed by a proper substitution of $x = y + z$, provided the equation have equal roots. To avoid fractions in both cases, suppose, first, the general equation $ax^m + bx^{m-1} + cx^{m-2} + \dots + d$, where a, b, c, d , &c. are integers; to which form all equations may be reduced. Then we avoid fractions by supposing $x = y$. In the second method, we have the general equation $ax^m + bx^{m-1} + cx^{m-2} + \dots + d$, where we may put $x = \frac{y}{a}$; but this substitution may sometimes well omitted.

It is to be observed, that this method may be successfully extended to literal equations. Thus in the general cubic equation, $1 = ax^3 + bx^2 + cx$, form the series $0, 0, 0, 1, a, a + b, a + b + c, a + b + c + d, \&c.$ then will the proximate value of $x = \frac{a + b + c + d}{a^2 + 3ab + 3ac + 4d}$.

The learned author of these methods afterwards applied them to the resolution of infinite equations; for which we must refer the reader to the *Acta Petropolitana* tom. v. p. 63, 67.

The ingenious Mr. Simpson gives us the following method for the solution of equations in numbers, when only one equation is given, and one quantity (x) to be determined.

Take the fluxion of the given equation, supposing x to be the variable quantity; and having divided the whole by x , let the quotient be represented by A . Eliminate the value of x pretty near the truth, substituting the same in the equation, as also the value of A , and let the error, or remaining number in the former, be divided by this numerical value of A , and the quotient be subtracted from the said former value of x , and from thence will arise a new value of that quantity, much nearer the truth than the former, wherewith proceeding as before, another new value may be had, &c. till we arrive at any degree of accuracy desired.

For instance, suppose, $300x - x^3 = 100000$. To find x , take the fluxion of the given equation, and expunging x , we have, $300 - 3x^2 = A$. It appearing, by inspection, that $300x - x^3$, when $x = 3$, will be less, and when $x = 4$, will be greater than 1000, estimate A at 3.5, and substitute it instead thereof both in the equation, and in the value of A . The error in the former is 7.125, and the value of the latter is 263.25; wherefore taking $\frac{7.125}{263.25} = 0.027$ from 3.5, there remains 3.473 for a new value of x . With this proceeding as before, the next error, and the next value of A will be 0.0000218 and 263.815 respectively. Hence the third value of $x = 3.4726351$; which is true to 7 or 8 places.

The proposed equation need not always be delivered from radicals, though this be sometimes convenient, yet it is also sometimes insupportably tedious. Thus, if we had the equation $\sqrt{1-x} + \sqrt{1-2x} + \sqrt{1-3x} = 2$, the clearing it from surds would be very tedious; but Mr. Simpson's method gives the root without any previous reduction.

The like is to be observed, when two equations are given, and as many unknown quantities (x and y) are to be determined. For all which we refer to the author himself, in his *Essays*, printed 1740, p. 82, seq.

The old method of Vieta, for solving affected equations, was extremely tedious. It was formed by analogy, from the common method of extracting the roots of pure powers. See Vieta's *Opera*, Math. pag. Elzev. p. 193, or Wallis's *Algebra*, Oughtred's *Clavis*, De Lagrange's *Algebra*, & d'Algebra, p. 415, &c. Equations are considered two ways; either as the ultimate conclusions we arrive at in the solution of problems; or as means, by the help whereof, we arrive at those final solutions.

An equation of the first kind consists only of one unknown quantity, which is intermixed with other known quantities. Those of the latter kind consist of several unknown quantities, which are to be compared, and connected together, till out of them all arise a new equation, wherein there is but one unknown quantity mixed with the known. To obtain the value of which unknown quantity, the equation is generally turned, and transformed various ways, till it be brought as low, and rendered as simple, as possible.

The doctrine and practice of equations, that is, the solution of questions by equations, consists of several steps, or parts, viz. 1. The determining of the several quantities,

ties, or expressing them in proper signs, or symbols. 2. The bringing of the quantities thus denoted to an *equation*. 3. The reducing of that *equation* to its lowest and simplest terms. To which, 4. May be added the constructing of the *equation*, or representing it in geometrical lines.

With regard to the first, a question, or problem, being proposed, we conceive the thing sought or required, as already done; and accordingly note or express it by one of the first letters of the alphabet, x, y, z , or a , noting the other known quantities by the first letters of the alphabet, $a, b, c, d, &c.$

The question being thus stated in species, it is considered whether, or no, it be subject to any restrictions, i. e. whether it be determinate, or no; which is found by these rules.

1. If the quantities sought be more than the number of *equations* given, or contained in the question, it is indeterminate, and capable of innumerable solutions. The *equation* is found, if they be not expressly contained in the problem itself, by the theorems of the equality of quantities.

2. If the *equation* given, or contained in the problem, be just equal in number to the unknown quantities, the question is determinate, or admits but of a limited number of answers.

3. If the unknown quantities be fewer than the given *equations*, the question is yet more limited; and sometimes it discovers itself impossible, by some contradiction between the *equations*. See REDUCTION of *equations*.

Now, to bring a question to an *EQUATION*, that is, to bring the several mediate *equations* to one final one, the principal thing to be attended to, is to express all the conditions thereof by so many *equations*. In order to which it is to be considered, whether the propositions or sentences, wherein it is expressed, be all of them fit to be noted in algebraic terms; as our conceptions are to be in Latin, or Greek characters. And if so, as is generally the case in questions about numbers, or abstract quantities, then let names be given both to known and unknown quantities, as far as occasion requires; and thus the drift of the question will be caught, as we may call it, in the algebraic language; and the condition, thus translated to algebraic terms, will give so many *equations* as are necessary to solve it. To illustrate this by an instance: Suppose it required to find three numbers, in continual proportion, whose sum is 20, and the sum of their squares 140; putting x, y, z , for the names of the three numbers sought, the question will be translated out of the verbal to the symbolical expression, thus:

The question in words.	In symbols.
Required three numbers, on this condition:	x, y, z
That they be continually proportional.	$x:y::y:z$, or $xy=yz$
That the sum be 20.	$x+y+z=20$
And the sum of their squares 140.	$x^2+y^2+z^2=140$

Thus is the question brought to these *equations*, viz. $xy=yz$, $x+y+z=20$, and $x^2+y^2+z^2=140$, by the help whereof, x, y , and z , are to be found by the rules already laid down.

The solution of questions are, for the most part, in much the more expeditious and artificial, by how much the unknown quantities, you have at first, are the fewer. Thus, in the question proposed, putting x for the first number, and y for the second, $\frac{y^2}{x}$ will be the third continual proportional, which being put for the third number, brings the question into *equation*, as follows:

The question in words.	Symbolically.
There are sought three numbers in continual proportion.	$x, y, \frac{y^2}{x}$
Whole sum is 20.	$x+y+\frac{y^2}{x}=20$
And the sum of their squares 140.	$x^2+y^2+\frac{y^4}{x^2}=140$
You have therefore the <i>equation</i> $x+y+\frac{y^2}{x}=20$, and $x^2+y^2+\frac{y^4}{x^2}=140$, by the reduction whereof, x , and y , are to be determined.	

Take another example: a merchant increases his estate annually by one third part, sharing 1000, which he spends yearly in his family; and after three years he finds his estate doubled. *Query*, what is he worth? To resolve this, it must be observed, that there are (or he had) several propositions, which are all thus found out, and laid down.

Vol. II. N^o 117.

In words.	Symbolically.
A merchant has an estate —	
Out of which the first year he spends 1000.	$x=1000$
And afterwards the estate by one third —	$x=1000 + \frac{x-1000}{3}$, or $\frac{4x-1000}{3}$
And the second year he spends 1000.	$\frac{4x-1000}{3} - 1000$, or $\frac{4x-4000}{3}$
And afterwards the estate by one third —	$\frac{4x-4000}{3} + \frac{4x-4000}{9}$, or $\frac{16x-28000}{9}$
And in the third year he spends 1000.	$\frac{16x-28000}{9} - 1000$, or $\frac{16x-37000}{9}$
And by the rest value likewise one third.	$\frac{16x-37000}{9} + \frac{16x-37000}{27}$, or $\frac{64x-148000}{27}$
And he becomes as large as at first.	$\frac{64x-148000}{27} = x$
Therefore the question is brought to this <i>equation</i> , $\frac{64x-148000}{27} = x$, by the reduction whereof you will find the value of x .	

Viz. Multiply it into 27, and you have $64x-148000=27x$; subtract $27x$, and there remains $37x-148000=0$, or $37x=148000$; and dividing by 37, you have $x=14800$. So that the value of his estate at first was 14800.

It appears then, that to the solution of questions about numbers, or the relations of abstract quantities, there is scarce any thing more required, but to translate them out of the common into the algebraic language, i. e. into characters, proper to express our ideas of the relations of quantities. Indeed, it may sometimes happen, that the language wherein the question is stated, may seem unfit to be rendered into the algebraic; though by making a few alterations therein, and attending to the sense, rather than the sound of the words, the translation becomes easy enough. The difficulty here results merely from the difference of idiom, which is as observable between most languages as between the common and symbolical. However, to render the solution of such problems a little more easy and familiar, we shall add an example or two of them.

1. Given the sum of two numbers a , and the difference of the squares b ; to find the numbers themselves. Suppose the lesser, x ; the other will be $a-x$; and their squares x^2 and $a^2-2ax+x^2$; whose difference, $a^2-2ax+x^2-x^2$ is called by. Consequently, $a^2-2ax=b$. Whence, by reduction, $2ax=a^2-b$, or $x=\frac{a^2-b}{2a}$.

E. gr. Suppose the sum of the numbers, or a , to be 8, and the difference of their squares, or b , 15; then will $\frac{1}{2}x=\frac{8^2-15}{2 \times 8}=3$. And $a-x=5$. Therefore the numbers are 3 and 5.

2. To find three quantities, x, y , and z , the sum of each pair whereof is given. Suppose the sum of the pair x and y be a ; that of x and z be b ; and that of y and z be c . To determine the three numbers required, x, y , and z , we have three *equations* $x+y=a$, $x+z=b$, and $y+z=c$. Now, to exterminate two of the unknown quantities, e. gr. y and z , take away x , both from the first and second *equations*; and we shall have $y=a-x$, and $z=b-x$. Which values being substituted for y and z in the third *equation*, there will arise $a-x+b-x=c$; and by reduction $x=\frac{a+b-c}{2}$. Having found x , the former *equations*, $y=a-x$, and $z=b-x$, will give y and z . Thus, e. gr. if the sum of the pair x and y be 6; of x and z , 10; and of y and z , 13; then, in the value of x, y , and z , write 6 for a , 10 for b , and 13 for c ; and you will have $a+b-c=3$; and consequently $x=\frac{3+6-13}{2}=3$, $y=a-x=3$, and $z=b-x=7$.

3. To divide a given quantity into any number of parts, so that the greater parts shall exceed the less by any given difference. Suppose a to be a quantity which is to be divided into four such parts, the first and smallest whereof is a ; the excess of the second part above this, b , of the third, c , and the fourth d ; then will $a+b$ be the second part, $a+c$ the third, and $a+d$ the fourth; the aggregate of all which $4a+b+c+d$ is equal to the whole line a . Now, taking away from each, $b+c+d$, and there remains $4x=a-b-c-d$, or $x=\frac{a-b-c-d}{4}$.

Suppose, e. gr. a line of 20 feet to be divided into 4 parts, in such manner, as that the excess of the second above the first may be 2 feet, of the third 3 feet, and of the fourth 7 feet. Then the four parts will be $x=\frac{20-2-3-7}{4}=\frac{8}{4}=2$, $x+b=4$, $x+c=5$, $x+d=9$.

$c=5$, and $x+d=9$. And after the same manner, may a quantity be divided into a greater number of parts on the like condition.

4. *A person divides a little money among five beggars, according to the power of their pence for each of them: he therefore gives them five pence a-piece, and has three pence left: the number of beggars is required.* Let the number of beggars be called x ; and the person wants 8 pence of giving them all 5 pence. Consequently he has $3x-8$ out of which he gives 2 pence; and the remaining pence $+3x-8-2x=3$. That is, $x-8=3$, or $x=11$.

5. *The power or strength of one agent being given, to determine how many such agents will produce a given effect, as in a given time b.* Suppose the power of the agent fact, at that it may produce the effect c , in the time d ; then as the time d is to the time b , so is the effect c , which the agent can produce in the time d , to the effect it can produce in the time b , which accordingly will be $\frac{bc}{d}$. Then,

as the effect of one agent $\frac{bc}{d}$ is to the joint effect of them all, a ; so is that one agent, to all the agents. Consequently the number of agents will be $\frac{ad}{bc}$.

Thus, *e. g.* if a clerk, or writer, in 8 days time, transcribe 150 sheets; how many such clerks are required to transcribe 405 sheets in 9 days? *Ans.* 24. For if 8 be substituted for d , 15 for c , 405 for a , and 9 for b , the number $\frac{ad}{bc}$ will become $\frac{405 \times 8}{9 \times 15}$, that is, $\frac{3240}{135}$, or 24.

6. *The power of several agents being given, to determine the time x, wherein they will jointly perform a given effect b.* Suppose the powers of the agents, A, B, C, such as that in the times a, b, c , they would produce the effects a, b, c , respectively; and these, in the time x , would produce effects $\frac{ax}{a}, \frac{bx}{b}, \frac{cx}{c}$. Consequently $\frac{ax}{a} + \frac{bx}{b} + \frac{cx}{c} = d$, and by reduction $x = \frac{d}{\frac{a}{a} + \frac{b}{b} + \frac{c}{c}}$.

Suppose, *e. g.* that three workmen could finish a certain work in such and such times, viz. A once in three weeks, B thrice in eight weeks, and C five times in twelve weeks; and it is required in what time they will finish it together? Here, the powers of the agents A, B, C, are such as in the times 3, 8, and 12, respectively produce effects 1, 3, 5; and it is required in what time they will produce the effect together. For a, b, c, d, e, f, g , write 3, 8, 12, 1, 3, 5, 12; and there will come out $x = \frac{1}{\frac{1}{3} + \frac{1}{8} + \frac{1}{12}}$, or $\frac{1}{\frac{4}{24} + \frac{3}{24} + \frac{2}{24}}$, of a week, that is, 6 days, 51 of an hour, the time they will finish it in together.

7. *Given the specific gravities of a mixture, and of the several ingredients thereof, to find the proportion of the ingredients therein.* Suppose a the specific gravity of the mixture $A+B$; a that of A, and b that of B; since the absolute gravity, or weight, is compounded of the bulk of the body, and its specific gravity; aA will be the weight of A, bB that of B; and $a(A+B)$ the weight of the aggregate $A+B$. Consequently, $aA+bB=a(A+B)$; and therefore $aA-aB=aB$, or $a-b:a-c::A:B$. Thus, *e. g.* suppose the specific gravity of gold to be as 19, that of silver as 10; and that of king Hiero's crown, compounded of gold and silver, as 17; then will $A:B::a-b:a-c::19-10:17-10::7-2:203$; 6:10:3::the bulk of gold in the crown, to the bulk of silver; or 190:31::19:10:10:3:: $a \times 2-b:2-b:a-c$::the weight of the gold in the crown, to the weight of the silver; and 221:31::the weight of the crown to the weight of silver. See ALLOCATION and MIXTURE.

Dr. Halley's method for the solution of equations is thus: Let the root x of any equation be taken equal to such value as it is supposed to be taken near to the true value: then from the quantity x let all the powers of x , found in the proposed equation, be formed; and to these let their respective coefficients be prefixed. Let the power to be resolved be subtracted from the sum of the parts of the first column where x is not found; and let the difference be r . Then take the sum of all the coefficients of x in the second column, which call t ; and having added all the coefficients of x , the sum of which is called t , the root sought x , will, in a rational form, $= \frac{a+t}{t}$; and, in an irrational form, $= \frac{a+t}{t} \pm \sqrt{\frac{t^2 - r}{t^2}}$.

For instance, let it be proposed to find a root of the equation $x^4 - 3x^2 + 7x = 10000$, where 10000 is the residuum.

For the first supposition let $x=10$; we shall therefore have the equation

$$\begin{aligned} x^4 &= 10000 \\ -3x^2 &= -300 \\ +7x &= 70 \\ \hline &= 10000 - 300 + 70 = 9770 \end{aligned}$$

The sign $+$ and $-$, with respect to x and x^2 , are difficult, till it be known whether x be affirmative or negative; in which there is some difficulty, as the signs having several roots, the *successive composition* of the signs are called, are often increased by diminishing the sign of the contrary, diminished by increasing the sign of the same; and the sign of the quantity x is determined by the sign of the quantity r , which is determined by subtracted from the sum of the parts of the first column, the sign of r , and therefore of the power x , prevailing in its composition, will always be contrary to the sign of the difference r . Hence it will appear whether x be affirmative or negative, or whether x has been assumed greater or less than the true root. But $x=10$ ways equal to $\frac{1}{2} \pm \sqrt{\frac{1}{4} - \frac{r}{t^2}}$, as often as t and r have the same sign; but when they are connected with different signs, t becomes $\pm \sqrt{\frac{1}{4} + \frac{r}{t^2}}$. After that

has been found to be negative, $x, x^2, &c.$ will be made negative in the affirmative members of the equation, and affirmative in the negative members; that is, they must be writ with a contrary sign; but if x be affirmative, then must $x, x^2, x^3, &c.$ be affirmative in the affirmative members, and negative in the negative.

In the proposed example we have 10000 instead of the residuum 10000, or $b=+4597$ from whence it appears that x was taken greater than the true root; and consequently that x is negative. Hence the equation becomes $10450 - 4032 + 597x = 10000$; that is, $450 - 4032 + 597x = 0$. Therefore, $450 = 4032 - 597x$; or $t=450$; the root of which is $x = \frac{450}{597} = .7537688$.

or $\frac{1}{2} \pm \sqrt{\frac{1}{4} - \frac{r}{t^2}}$, that is, in the present case, $x = 2000 \pm \sqrt{4000000 - 450^2}$, from whence the approximated root is found to be ≈ 936 . Now this root being taken for a second supposition, and the operation being repeated, we shall have $x = 936.0000000000000000$, which is very exact, scarce exceeding the truth by above $\frac{1}{2}$ in the 11th figure.

This is sufficient to give a notion of Dr. Halley's method; those who desire more example, and further instructions may consult the Phil. Trans. No. 210, or Leibniz's Algebra, vol. i. p. 85, for.

EXPOSITION, DIFFERENTIAL, SEE DIFFERENTIAL. EQUATIONS, to solve geometrical problems. Geometrical questions, or those relating to continued quantities, are sometimes also brought to equations, after the same manner as arithmetical ones. So that the first rule to be here prescribed is, to observe every thing directed to the solution of numerical problems.

Suppose, *e. g.* it were required to cut a right line, as A B (Tab. Arithm. fig. 6.) in mean and extreme proportion in C; that is, so as that B C, the square of the greater part, shall be equal to the rectangle A C, contained under the whole and the lesser part. Here supposing A B = 20, and C B = x , then will A C = $20 - x$; and $x = x \times 20 - x$. An equation which, by reduction, gives $x = -\frac{1}{2} \pm \sqrt{\frac{1}{4} + 20}$.

But it is very rare that geometrical problems are thus brought to equations; as being generally found to depend on various complex positions, and relations of lines; so that here some farther artifice, and certain special rules, will be required, to bring them to algebraic terms. Indeed, it is very difficult to prescribe any thing precise in such cases; every man's own genius should be the rule of his procedure.

Something, however, shall be said in the general, for the sake of such as are not at all versed in such operations, and that principally from Sir Isaac Newton.

Observe then, 1. That problems concerning lines related to each other in any definite manner, may be variously stated, by supposing such or such quantities, or things sought, to be required from such and such data; yet still, with whatever data and questions the question is proposed, its solution will arise after the very same manner, without the least alteration of any circumstance, except in the imaginary species of lines, or in the names whereby the data are distinguished from the questions.

Suppose, e. g. the question were about six isosceles triangles, BCD [fig. 7.] inscribed in a circle, whose sides BC, BD, and BDCD, were to be compared with the diameter of the circle AB. Here the question may be either proposed, of investigating the diameter from the given sides and base, or investigating the base from the sides and diameter given. Or, lastly, of finding the sides from the base and diameter given; and propose it in either which form you will, it will be brought to an equation, by the same algebraic process.

Thus, if the diameter be sought, put $AB = x$, $CD = a$, and BC , or $BD = b$. Then, drawing AC, as the triangles ABC and CDE are similar; $AB : BC :: BC : BE$, or $x : b :: b : BE$. Wherefore $BE = \frac{b^2}{x}$, and

$CE = \frac{1}{2} CD$, or $\frac{1}{2} a$. And because the angle CEB is a right angle, $CE^2 + BE^2 = BC^2$, that is, $\frac{1}{4} a^2 + \frac{b^4}{x^2} = b^2$.

Which equation being reduced, gives the diameter required, x . Again, if the side be sought, put $AB = x$, $CD = a$, and BC , or $BD = b$. Then drawing AC, as the triangles ABC and CDE are similar; $AB : BC :: BC : BE$, or $x : b :: b : BE$. Wherefore $BE = \frac{b^2}{x}$, and

$CE = \frac{1}{2} CD$, or $\frac{1}{2} a$. And since the angle CEB is right, $CE^2 + BE^2 = BC^2$, that is, $\frac{1}{4} a^2 + \frac{b^4}{x^2} = b^2$; an equation which, reduced, gives the base sought, a .

Lastly, if the side BC, or BD, were sought, put $AB = x$, $CD = a$, and BC , or $BD = b$. Then drawing AC, the triangles ABC and CDE, being similar, we have $AB : BC :: BC : BE$, or $x : b :: b : BE$. Wherefore $BE = \frac{b^2}{x}$. And $CE = \frac{1}{2} CD$, or $\frac{1}{2} a$; and the angle CEB being right, $CE^2 + BE^2 = BC^2$. That is, $\frac{1}{4} a^2 + \frac{b^4}{x^2} = b^2$. An equation which, by reduction, gives a required.

That is the calculus for arriving at the equation, as well as the equation itself, the same in all the cases; except that the first lines are designed by different letters, according as they are data, or quantities. Indeed, as the data or quantities differ, there arises a difference in the reduction of the equation found; but there is no difference in the equation itself. So that we need make no difference between given and sought quantities; but are at liberty to place the question with such data and quantities, as we think most favorable to the solution of the question.

2. A problem then being proposed, compute the quantities it intitles; and, without making any difference between data and quantities, consider what dependences they have on each other, that you may learn which of them will, by supposition, give the rest; in the doing of which, it is not necessary you should at first conceive how some may be detached out of others, by an algebraic calculus: it suffices you remark in the general, that it may be detached by some direct connection. Thus, e. g. if the question be about the diameter of a circle, AD [fig. 8.] and three lines AB, BC, CD, inscribed in a semicircle, wherein, the rest being given, BC is required; it is evident, at first sight, that the diameter AD determines the semicircle; as also, that the lines AB and CD, by intersection, determine the points B and C, and consequently BC required, and that by a direct connection. Yet does not it appear how BC is detached from the same data, by any analytical calculus.

3. Having considered the several ways wherein the terms of the question may be explained and distinguished, choose those of the synthetic method; assuming some lines, in given, from which there is the most easy access, or progression to the rest, and to which the regression is the most difficult. For, though the calculus may be carried on diverse ways, yet must it begin with these lines; and the question is more readily solved, by supposing it to be of these data, and some quantities really flowing from them, than by considering the question as it is actually proposed.

Thus, in the example already given, if from the rest of the quantities given, it were required to find AD; perceiving that this cannot be done synthetically; yet that if it were so done, I could proceed in my reasoning on it in a direct connexion from one thing to others. I assume AD as given, and begin to compute as if it was really given, and some of the other quantities, viz. some of the given ones, as AB, BC, or CD, were sought; and thus, by carrying on the computation, from the quantities assumed to the others, as the relation of the lines in *any* manner, there will always be obtained an equation between two values of some one quantity; whether one of those values be a letter (set down as a representation, or name, at the beginning of the work,

for that quantity; and the other, a value of it found out by computation; or whether both be found by computation made different ways.

5. Having thus compared the terms of the question in general, there is some farther thought and address required, to find the particular connexions, or relations of the lines; for computation. For those quantities which, to a person who does not so thoroughly consider them, may seem immediately, and by a very near relation, connected together, when we come to express that relation algebraically, are often found to require a longer circuit, and shall even oblige you to begin your itemes anew, and carry on your computation step by step, as may appear by finding BC, from AD, AB, and CD. For you are only to proceed by such propositions, or connexions, as can be fully represented in algebraic terms, wherein there are several acting from Euclid, *xx*, 19. prop. 2. book vi. and *prop*. 47. lib. i. Elem.

To facilitate this discovery, of the relations of the lines in the figures, there are several things that contribute; as first, the addition and subtraction of lines; since from the values of the parts you may find the value of the whole; or from the value of the whole, and one of the parts, you may obtain the value of the other part. Secondly, by the proportionality of lines; since, as above supposed, the rectangle of the mean terms, divided by either of the extremes, gives the value of the other; or which is the same thing, if the values of all four of the proportionals be first had, we make an equality (or equation) between the rectangles of the extremes and means. But the proportionality of lines is best found out by the similarity of triangles; which, as it is known by the equality of their angles, the analyst ought in particular to be conversant in. In order to which, it will be necessary that he be master of Euclid, *prop*. 5. 13. 15. 29. and 32. lib. i. and of *prop*. 4. 5. 6. 7. 8. lib. vi. and of the 20. 21. 22. 27. and 31. lib. iii. To which may be added the 3d *prop*. lib. vi. or the 35th and 36th *prop*. lib. iii. Thirdly, the calculus is promoted by the addition or subtraction of squares; viz. in right-angled triangles we add the squares of the lesser sides, to obtain the square of the greater; or from the square of the greater side we subtract the square of one of the lesser, to obtain the square of the other. On which two foundations, if we add to them *prop*. 1. of the 6th Elem. when the business relates to superficies, and also some propositions taken out of the eleventh and twelfth books of Euclid, since both come in question, the whole synthetic art, as to right-lined geometry, depends. Indeed all the difficulties of problems may be reduced to the sole composition of lines out of parts, and the similarity of triangles; so that there is no occasion to make use of other theorems, because they may all be resolved into these two, and consequently into the solutions that may be drawn from them.

6. To accommodate these theorems to the solutions of problems, the schemes are oft times to be further contrived, by producing out four of the lines, all they cut some others, or become of an assigned length; or by drawing lines parallel or perpendicular, from some remarkable points; or by joining some remarkable points; as also, sometimes, by constructing them after other methods, according as the state of the problems and the theorems, which are made use of to solve it, shall require.

As for example: if two lines that do not meet each other, make given angles with a certain third line, we may produce them so, that when they concur, or meet, they shall form a triangle, whose angles, and consequently the ratio of their sides, shall be given, or if any angle be given, or be equal to any one, we often complete it into a triangle given in species, or similar to some other, and that by producing some of the lines in the scheme, or by drawing a line subtending an angle. If the triangle be an oblique angled one, we often resolve it into two right-angled ones, by letting fall a perpendicular. If the business concern multilateral or many-sided figures, we resolve them into triangles, by drawing diagonal lines, and so in others, always aiming at this end, viz. that the scheme may be resolved either into given, or similar, or right-angled triangles.

Thus, in the example proposed, draw the diagonal BD, that the trapezium ABCD may be resolved into two triangles, ABD, a right-angled one, and BDC an oblique angled one [fig. 8.]; then resolve the oblique angled one into two right-angled triangles, by letting fall a perpendicular from any of its angles, B, C, or D, upon the opposite side; as from B upon CD produced to E, that BE may meet it perpendicularly. But since the angles BAD and BCD, make in the mean while two right ones (by 23. *prop*. 3. *Euc*); as well as BCE and BCD, the angles BAD and BCE are perceived to be equal; consequently the triangles BCE and DAB to be similar,

similar. And so the computation (by assuming AD, AB, and BC, as if CD were sought) may be thus carried on; viz. AD and AB (because of the right-angled triangle ABD) give you BD. AB, AB, BD, and BC (because of the similar triangles ABD and CEF) give BF, and CE. BD and BE (because of the right-angled triangle BED) give ED, and ED-EC gives CD, whence there will be obtained an equation between the value of CD to find out, and the algebraic letter that denotes it. We may also, (and for the present part it is better to do so, than to follow the work too far to one continued series) begin the computation from different principles, or at least promote it by diverse methods, to one and the same conclusion, that at length there may be obtained two values of one of the same quantity, which may be made equal to one another. Thus AD, AB, and BC, give BD, BE, and CE, as before; then CD+CE gives ED; and lastly, DE, and ED (because of the right-angled triangle BED) give BE.

Having concerted your method of procedure, and drawn your scheme, give names to the quantities that enter the computation (that is, from which assumed, the values of others are to be derived, till you come to an equation) choosing such as involve all the conditions of the problem, and seem best accommodated to the business, and which may render the conclusion (as far as you can push) more simple, but yet not more than what shall be sufficient for your purpose; wherefore do not give new names to quantities which may be nominated from names already given. Thus, of a whole line given, and its parts, of the three sides of a right-angled triangle, and of three or four proportionals, some one of the least considerable we leave without a name; because its value may be derived from the names of the rest. As in the example already brought, if I make AD = x , and AB = a , I denote BD by no letter, because it is the third side of a right-angled triangle ABD, and consequently its value is $\sqrt{a^2 - x^2}$. Then if I say BC = c , since the triangles DAB and BCE are similar, and thence the lines AD:AB::BC:CE, or three whereof, viz. to AD, AB, and BC, there are already names given; for that reason I leave the fourth CE without a name, and in its room I make use of $\frac{ab}{x}$, derived from the foregoing proportionality. And so if DC be called e , I give no name to DE, because from its parts DC and CE, or e and $\frac{ab}{x}$, its value $e + \frac{ab}{x}$ comes out.

8. By this time the problem is almost reduced to an equation. For after the above letters are set down from the species of the principal lines, there remains nothing else to be done, but that out of those species the values of other lines be made out, according to a pre-conceived method, till after some foreign way they come to an equation. And there is nothing wanting in this case, except that by means of the right-angled triangles BCE and BDE, I can bring out a double value of BE, viz. BC:CE::BE:DE (or $bb::\frac{ab}{x}b$) = BE²; as also BD² = DE² (or $x^2 - 2x - cc = \frac{2ab}{x} - \frac{ab}{x}$) = BE².

And hence (expunging on both sides $\frac{2ab}{x}$) you shall have the equation $bb = x^2 - 2x - cc - \frac{ab}{x}$; which being reduced, becomes $x^3 = x^2 + 2x + 2ab + ccx$.

9. For the geometry of curves; I denote them either in describing them by the local motion of right lines, or by using equations indefinitely expressing the relation of right lines disposed in order, according to some certain law, and ending at the curve lines. See CONIC SECTIONS.

The ancients used the same by the sections of solids; but they effected it less commodiously. The computations which regard curves, described after the first manner, are performed as above directed; thus suppose AKC (fig. 9.) a curve line, described by K, the vertical point of the right angle AKC, whereas one leg, AK, freely slides through the point A given in position, while the other leg KC of a determinate length is carried along the right line AD, also given in position; and it is required to find the point C, in which any right line CD, given also in position, shall cut this curve: draw the right lines AC, CF, which may represent the right angle in the position sought; and CM perpendicular to AF, and the relation of the lines (without any difference or regard of what is given or sought, or any respect had to the curve) being considered, you perceive the dependency of the

other upon CF, and any of these four, viz. BC, BF, AF, and AC, to be synthetical; two whereof you assume as CF = a , and C B = x ; and beginning the computation from thence, you presently obtain BF = $\sqrt{a^2 - x^2}$, and AB = $\frac{ax}{\sqrt{a^2 - x^2}}$, because of the right angle CBF; and that the lines BF:BC::BC:AB are continual proportionals. Moreover, from the given position of CD, AD is given, which therefore call s ; there is also given the ratio of BC to BD, which suppose as t to u , and you have BD = $\frac{cs}{u}$, and AB = $b - \frac{cx}{u}$.

Therefore $b - \frac{cx}{u} = \frac{cs}{u}$, an equation, which by squaring its parts, and multiplying by $u^2 - a^2$, will be reduced to this form.

$$u^4 - 2bdcx^2 + c^2x^4 - b^2d^2 - 2abdcx + a^2d^2 = 0.$$

Whence, lastly, from the given quantities, a , b , d , and c , x may be found; and at that interval, or distance, a or BC, a right line drawn parallel to AD, will cut CD in the point sought, which is C.

If, instead of geometrical descriptions, we use equations to denote the curve lines by, the computations will thereby become as much simpler and easier, as the gaining of those equations can make them. Thus, suppose the intersection C of the given ellipsis ACE, (fig. 10.) with the right line CD given in position, sought; to denote the ellipsis, take some known equation proper to it, as $x^2 = \frac{1}{q} - x^2 = y$, where x is indefinitely put for any part of the axis AB, or AB, and y for the perpendicular BC, terminated at the curve; and r and q are given for the given species of the ellipsis. Since therefore CD is given in position, AD will also be given, which call a ; and BD will be $a - x$; also the angle ADC will be given, and thence the ratio of BD to BC, which call r to q ; and BC (y) will be $bc = \frac{a - x}{q}$, whose square $cc = \frac{a^2 - 2ax + x^2}{q^2}$, will be equal to $r^2 = \frac{1}{q} - x^2$. And thence by reduction there will arise $x^2 = \frac{a^2 - 2ax + r^2}{4cc - q}$, or $x = \frac{ac + r}{4cc - q}$.

And, that the $ac + r$ is $\sqrt{4r^2 + \frac{r^2}{4cc - q}}$. Add, that the $ac + r$ is $\frac{r}{q}$.

A curve be denominated by a geometrical description, or by a section of a solid, yet thence an equation may be obtained, which shall define the nature of the curve, and consequently all the difficulties of problems proposed about it, may be reduced hither. Thus, in the former example, if AB be called x , and BC, y , the third proportional BE will be $\frac{xy}{x}$, whose square, together with

the square BC, is equal to CF², that is, $\frac{y^2}{x^2} + y^2 = a^2$; or $x^2 + a^2 y^2 = ax^2$. And this is an equation, by which every point C, of the curve AKC, agreeing or corresponding to any length of the base (and consequently the curve itself), is defined; and from whence consequently you may obtain the solutions of problems proposed concerning this curve.

After the same manner almost, when a curve is not given in species, but proposed to be determined, you may assign an equation at pleasure, that may contain its general nature; and assume this to denote it, as if it was given; that from its assumption you may find some way arrive at an equation, by which the assumptions may be determined.

What remains of the doctrine and practice of equations, relates to their reduction to the lowest and simplest terms, the better to come at the value of the unknown quantity in the equations, and their geometrical construction. See REDUCTION of equations.

EQUATIONS, extraction of the root of. See EXTRACTION of roots of equations.

EQUATIONS, construction of. See CONSTRUCTION of equations, and CURVE.

EQUATIONS, conversion of. See CONVERSION.

EQUATIONS, coefficient, immovable, exponential, and transcendental. See the adjective.

EQUATION of payment. In Arithmetic, is the method of reducing several debts payable at different times, and bearing no interest till after the term of payment to a single debt or payment, to be discharged at once, without loss either to debtor or creditor, allowing simple interest; or, it is the method of finding the equated term at which

these several debts should be paid in one sum. Cocker, Hatton, Kersey, Sir Samuel Moreland, and Ward, have given rules for this purpose, which Mr. Malcolm has examined and found to be erroneous; and though the error resulting from any of the rules which they have proposed is not very considerable, the following process furnishes one more accurate:

Let the debt first payable be a

called d The last payable debt D

The distance of the term of x the distance of the term T

payment r the distance of the term T

The distance of the equated time x

The rate of interest, or 1 year's interest of $1l.$ r

The distance of the time t and x is $x-t$ for x the be-

Tie distance of the time T and x is $T-x$ when then.

Then the interest of d for the time $x-t$ is $dx-rx-t$,

or $dx-rx-t$, dx being one year's interest of d ; and

$DT-rD$ is the discount of D for the time $T-x$,

$1+T-r-x$ is the interest of $1l.$ for that time,

which is consequently the discount of $1+T-r-x$ for the

same time; consequently, from the nature of the ques-

tion, we shall have $dx-rx-t = \frac{DT-rD}{1+T-r-x}$; which,

being reduced, gives $T+t = \frac{D+d}{dx-rx-t}$; or $a = \frac{D+d}{dx-rx-t}$

$\frac{DT+dt}{dx-rx-t} + T$. Then make $T+t = a$, and

$\frac{DT+dt}{dx-rx-t} + T = a$, and $a-x = a^2 = 1$, and, resolving this

quadratic equation, $x = \frac{a \pm \sqrt{a^2 - 1}}{2}$.

E. gr. Suppose 100l. payable one year hence, and 105l.

payable three years hence; what is the equated time,

allowing simple interest at 5 per cent. per annum?

Here $\frac{100}{1} = 100$, $\frac{105}{3} = 35$.

Then $D+d=205$, $dx=5$, and $\frac{D+d}{dx-rx-t} = \frac{205}{5} = 41$

And $T+t = \frac{D+d}{dx-rx-t}$, or $a = 41 = 45$.

And $1 + \frac{DT+dt}{dx-rx-t} + T = \frac{315+100}{5} + 3 = 83 + 3 = 86$.

Consequently,

$x = \frac{45 \pm \sqrt{45^2 - 86}}{2} = \frac{45 \pm \sqrt{2025 - 86}}{2} = \frac{45 \pm \sqrt{1939}}{2} = 22.5 \pm$

$\sqrt{470.25} = 21.5$, $20.5 = 42$ or 2 ; but 42 cannot be the

true answer by the conditions of the question, since it is

greater than the distance of the last term in the question,

and therefore 2 is the answer required.

If there are more debts than two, you must first find an

equated time for the two that are first payable; then

consider their sum as a debt payable at that equated time,

and find another equated time for that debt and the next

of the given debts, &c. See Malcolm's Arithm. book

vi. § 5. or p. 616-621.

EQUATION OF TIME. In *Astronomy*, denotes the difference

between mean and apparent time, or the reduction of

the apparent unequal time or motion of the sun or a

planet, to equable and mean time, or motion.

Time is only measured by motion; and as time in itself

flows ever equally, to measure it, such a motion must be

used as is equable, or which always proceeds at the same

rate.

The motion of the sun is commonly used for this pur-

pose, as it is the most easy to be observed; yet it wants

the great qualification of a chronometer, which is equali-

ty. In effect, the astronomers find, that the sun's

apparent motion is no ways equal; that he now and then

slackens his pace, and afterwards quickens it again; and

consequently equal time cannot be measured thereby.

See SUN.

Hence the time which the sun's motion shews, called

the *apparent* time, becomes different from the true and

equable time, shown by a well-regulated clock, wherein

all the celestial motions are to be estimated and account-

ed; so that the time shewn by such a clock and a true

sun-dial is never the same, but on the 15th of April,

the 16th of June, the 31st of August, and the 24th of

December. See the annexed table.

This inequality of time is thus accounted for: the natu-

ral or solar day is measured not properly by one en-

tire revolution of the equinoctial, or 24 equinoctial

hours, but by the time which passes while the plane of a

meridian, passing through the centre of the sun, does,

by the earth's conversion round its axis, return again to

the sun's centre, which is the time between one mid-

day and the next.

Now, had the earth no other motion but that round its

Vol. II. N° 117.

axis; all the days would be precisely equal to each other, and to the time of the revolution of the equi-
noctial, but the case is otherwise; for while the earth
is turning round its axis, it is likewise proceeding for-
ward in its orbit. So that when a meridian has com-
pleted a whole revolution from the sun's centre, its
plane has not yet arrived at the sun's centre again, as
will appear from the figure.

Let the sun be S (*Tab. Astron. fig. 50*); and let AB be
a portion of the ecliptic; let the line MD represent any
meridian, whose plane produced passes through the sun
when the earth is in A . Let the earth proceed in its
orbit; and in making one revolution round its axis, let
it arrive at B ; then will the meridian MD be in the
position $m d$ parallel to the former MD ; and conse-
quently this has not yet passed through the sun, nor have
the inhabitants under that meridian yet had their mid-
day: but the meridian $d m$ must still proceed with its
angular motion, and describe the angle $d B f$ before its
plane can pass through the sun.

Hence, it appears that the solar days are all longer than
the time of one revolution of the earth round its axis.

However, were the planes of all the meridians perpen-
dicular to the plane of the earth's orbit, and did the earth
proceed with an equal motion in its orbit, the angle $d B f$
would be equal to the angle $B S A$, and the arches $d f$
and $A B$ would be similar; consequently, the times would
be always equal, the arch $A B$, and the angle $d B f$, of
the same quantity, and all the solar days equal to each other,
and the apparent and real time agree.

But as it is, neither of those is the case; for the earth
does not proceed in its orbit with an equable motion;
but in its aphelion describes a less arch, and in its peri-
helion a greater, in the same time; besides, the planes
of the meridians are not perpendicular to the ecliptic,
but to the equator; consequently, the time of the angu-
lar motion $d B f$, which is to be added to the entire
revolution in order to make a whole day, is not always
of exactly the same quantity.

The same will be found, if setting aside the considera-
tion of the real motion of the earth, we consider the ap-
parent motion of the sun in lieu thereof, as being what
we measure time by. On this principle we observe, that
the day not only includes the time of one revolution of the
globe on its axis, but it is increased by so much as an-
swers to that part of the sun's motion performed in that
time: for when that part of the equinoctial, which, with
the sun, was at the meridian yesterday at noon, is come
thither again to-day, it is not yet noon, the sun not being
now at the place where he yesterday was, but gone for-
ward near a degree, more or less; and this additament
above the 24 equinoctial hours is upon a double account
unequal.

1. In that the sun, because of his apogee and perigee,
does not at all times of the year dispatch an equal arch of
the ecliptic in one day, but greater arches near the peri-
gæum, which, in the present century, is on the 30th of
December; and lesser nearer the apogæum, which is on
the 30th of June.

2. In that though the sun should always move equally in
the ecliptic, yet equal arches of the ecliptic do not, in
all parts of the zodiac, answer to equal arches of the
equator, by which we are to estimate time, because some
parts thereof, as the two solstitial points, lie nearer to
a parallel position to the equinoctial than others, e. gr.
those about the equinoctial points where the ecliptic and
equinoctial intersect. Whereupon an arch of the ecliptic
near the solstitial points answers to a greater arch of the
equinoctial than an arch equal to it near the equi-
noctial points.

The apparent motion of the sun to the east then being
unequal, the natural and apparent days are no ways pro-
per to be applied to measure the celestial motions, which
have no dependence on that of the sun.

And hence astronomers have been obliged to invent
other days for the use of their calculations; those others
are equal, and are a mean between the shortest and longest
of the unequal ones.

These are had by considering the number of hours in
the whole revolution of the sun in the ecliptic, and di-
viding the whole time into as many equal parts as
there are hours, 24 of which constitute the day; and
the reduction of the days constitutes the *equation* of natu-
ral days.

Consequently, computing these motions according to
equal time, it is necessary to turn that time back again into
apparent time, that they may correspond to observation;
on the contrary, any phenomenon being observed, the
apparent time thereof must be converted into equal time,
to have it correspond with the times marked in the astro-
nomical tables. As we do not know of any body in nature
that moves equally, yet such a motion being alone pro-
per to measure equal days and hours; it has been thought

fit to imagine some body, e. g. a star moving in the equator eastward, and never quickening or slackening its pace, but going through the equator in precisely the same time as the sun finishes his period in the ecliptic.

The motion of such a star will represent equal time, and its diurnal motion of the equator will be $59^{\circ} 8'$, the time as the mean or equated motion of the sun in the ecliptic; consequently, the mean or equable day is determined by the arrival of the star at the meridian, and is equal to the time wherein the whole circumference of the equator or 360° pass the meridian, and $59^{\circ} 8'$ more; which addition of $59^{\circ} 8'$ remaining always the same, these mean or equated days will be constantly equal.

Since then the sun goes unequally eastwards with respect to the equator, it will sometimes arrive at the meridian sooner than this imaginary star, and sometimes later: the difference is the difference between true and apparent time; which difference is known by having the place of the imaginary star in the equator, and the point of the equator which comes to the meridian with the sun; for the arch intercepted between them being converted into time, shews the difference between equal and apparent time, which, as before, is called the *equation of time*.

The *equation of time*, then, may be defined: the time that flows while the arch of the equator intercepted between the point determining the right ascension of the sun, and the place of the imaginary star, passes the meridian; or as Tycho, and after him Street, state it, it is the difference between the sun's true longitude and his right ascension.

To EQUATE solar days, that is, to convert apparent into mean time, and mean into apparent time. 1. If the sun's right ascension be equal to his mean motion, the imaginary and true sun will pass the meridian at the same time; consequently, the true coincides with the apparent time.

2. If the right ascension be greater than the mean motion, subtract the latter from the former; and turning the difference into solar time, either subtract it from the

apparent time to find the mean time; or add it to the mean time to find the apparent.

3. Lastly, if the right ascension be less than the mean motion, subtract the former from the latter; and turning the difference into solar time, either add it to the apparent time to find the mean time, or subtract it from the mean time to find the apparent.

This method of *equation* obtains, if the calculus be progressive; if it be retrograde, that is, if the time be reckoned backwards, the operation must be just the reverse.

Or, find the mean and true anomalies for any proposed day; their difference will be the *EQUATION of the centre*. The true anomaly gives the sun's longitude, with which, and the obliquity of the ecliptic, compute the right ascension; then add or subtract the difference between the longitude and right ascension to or from the equation of the centre, and the sum or difference, converted into time, gives the *equation* sought.

This doctrine of the inequality and *equation* of natural days, is not only of use in astronomical observations, but also in the adjusting and direction of clocks, watches, and other time-keepers: hence we see why a pendulum or other movement, which measures apparent equal time, does not keep pace with the sun, which measures apparent time, but is sometimes before, and sometimes later than the same. Whence such automata and sun-dials are necessarily found almost perpetually at variance.

The variations of the two kinds of time are exhibited in the following tables for every day throughout the year. Mr. Flamsteed was the first who fully demonstrated and cleared this inequality of natural days; though others, and even Ptolemy, had a partial notion of it.

The use of the tables is obvious; a clock or watch that is to be kept to true or equal time, must be so many minutes and seconds faster or slower than a sun-dial, as is assigned in the tables for the respective day, or if you would have it go by the sun-dial, it goes well if it gains or loses each day the number of minutes and seconds in the tables. See CLOCK.

TABLES of the EQUATION of natural Days, for regulating Clocks and Watches by the Sun.

the eccentricity when the greatest *equation* is known; and Mr. Euler thinks the question insoluble without this help. See the Table, lib. vi. p. 125, seq.

The motions of the sun and moon are affected with various inequalities, whence arises the necessity of so many *equations*.

From these inequalities, the moon's place become exceeding difficult to be determined; to remove which difficulty, is the great design of Sir Isaac Newton's New Theory of the Moon, wherein we are furnished with *equations* for all the inequalities of the mean motion.

The principal of these are,

EQUATION 1st, annual, of the mean motion of the sun and moon, and of the apogee and nodes of the moon.

The annual *equation* of the sun's centre being given, the three other corresponding annual *equations* will be also given, and therefore a table of that will serve for all. For if the annual *equation* of the sun's centre be taken from thence for any time, and be called P , and let $3 - P = Q$, $Q + \frac{1}{2} = R$, $R - \frac{1}{2} = S$, $S + \frac{1}{2} = T$, $T - \frac{1}{2} = U$, and $U - \frac{1}{2} = V$; then shall the annual *equation* of the moon's mean motion for that time be R , that of the apogee of the moon will be S , and that of the node F .

Only observe, that if the *equation* of the sun's centre be required to be added, then the *equation* of the moon's mean motion must be subtracted; that of her apogee must be added, and that of the node subtracted; and, on the contrary, if the *equation* of the sun's centre were to be subtracted, the moon's *equation* must be added, the *equation* of her apogee subtracted, and that of her node added.

There is also an *equation* of the moon's mean motion, depending on the situation of her apogee in respect of the sun, which is greatest when the moon's apogee is in an octant with the sun, and is nothing at all when it is in the quadratures or syzygies. This *equation*, when greatest, and the sun in perigee, is 3 min. 50 seconds. But if the sun be in apogee, it will never be above 3 min. 34 seconds. At other distances of the sun from the earth, this *equation*, when greatest, is reciprocally as the cube of that distance. But when the moon's apogee is any where but in the octants, this *equation* grows less; and is mostly at the same distance between the earth and sun, as the sine of the double distance of the moon's apogee from the next quadrature or syzygy to the radius. This is to be added to the moon's motion while her apogee passes from a quadrature with the sun to a syzygy; but is to be subtracted from it, while the apogee moves from the syzygy to the quadrature.

There is, moreover, another *equation* of the moon's motion, which depends on the aspect of the nodes of the moon's orbit with respect to the sun; and this is greatest when her nodes are in octants to the sun, and vanishes quite when they come to their quadratures or syzygies. This *equation* is proportional to the sine of the double distance of the node from the next syzygy or quadrature; and at the greatest, is but 47 seconds. This must be added to the moon's mean motion while the nodes are passing from the syzygies with the sun to their quadratures with him, but subtracted while they pass from the quadratures to the syzygies.

From the sun's true place take the equated mean motion of the lunar apogee as was above shewed, the remainder will be the annual argument of the said apogee; from whence the eccentricity of the moon and the second *equation* of her apogee may be compared. See Theory of the Moon's Motion, &c.

EQUATION, eccentric. See ECCENTRIC.

EQUATION, lunar and solar, in Chronology. See METEOROLOGII.

EQUATOR, or EQUATOR, in Astronomy and Geography, a great circle of the sphere, equally distant from the two poles of the world, or having the same poles with those of the world.

Such is the circle DA (Tab. Astron. fig. 52.) its poles being P and Q . It is called the *equator*, because when the sun is in it the days and nights are equal; whence also it is called the *equinoctial*, and when drawn on maps and planispheres, the *equinoctial line*, or simply, the *line*. Every point of the *equator* is a quadrant's distance from the poles of the world; whence it follows, that the *equator* divides the sphere into two hemispheres, in one of which is the northern, and in the other the southern pole.

By the passages or transits of arcs of the *equator* over the meridian, equal or mean time is estimated; hence we have frequent occasion for the conversion of degrees of the *equator* into time; and again, for the re-conversion of parts of time into degrees or parts of the *equator*.

For performance whereof, we subjoin the following table, wherein are exhibited the arcs of the *equator*, which pass the meridian in the several hours, minutes, &c. of equated or mean time.

Conversion of the parts of the *equator* into Time, and vice versa.

Deg. of Equat.	Hours.	Min.	Hours.	Deg. of Equat.	Hours.	Min.
Min.	Min.	Sec.	Min.	Min.	Min.	Sec.

85	8	0	85	315	21	0
90	9	0	90	330	22	0
95	9	0	95	345	23	0
100	10	0	100	360	24	0

The construction of this table is very easy; for the *equator* being divided into 360 degrees, and revolving always in 24 hours, any point of it moves through 15° in one hour, and in one minute through the both part of $15'$, or 15 of a degree, and in one second through $15''$ of a degree, &c. and therefore nothing more is necessary besides simple addition, in order to have the number of degrees, minutes, and seconds, which it describes in any given time.

The use of the table is obvious; suppose, e. gr. it were required to turn $10^\circ 15' 7''$ of the *equator* into time: against 15 deg. in the fifth column we have $1^h 0^m 00^s$; against $15'$ degs. we have $16^m 0^s$; against 10 minutes, 40^m ; against 7 minutes, $12^m 0^s$; against 5 seconds, we have $0^m 20^s$; and against 7 seconds, $0^m 12^s$; which, added together give $1^h 16^m 52^s 28''$.

Again, suppose it were required to find how many degrees, minutes, &c. of the *equator* answer to 23 hours 25 min. 17 sec. and 9 thirds. Against 23^h in the fourth column of the table, you have 345° ; and against 2 hours, 30° ; against 20^m , 5° ; against 15^m , $1^\circ 15'$; against 10^m , $2^\circ 30'$; against 5^m , $7^\circ 15' 0''$; against 1^m , $2^\circ 30' 0''$; against 6 thirds, $1^\circ 30'$; and against 9 thirds, $45''$; which, added together, give $351^\circ 19' 17' 15''$. See EQUINOCTIAL.

EQUATOR, elevation or altitude of the. See ELEVATION of the *equator*.

EQUATOREAL, universal, in Astronomy, is the name of an excellent instrument lately constructed by Mr. Ramsden, an ingenious philosophical instrument maker in London. The principal parts of this *equatoreal* (see Tab. II. Astronomy, fig. 74.) are: 1. The azimuth or horizontal circle A , which represents the horizon of the place and moves on a long axis B , called the vertical axis. 2. The *equatoreal* or hour circle C , representing the *equator*, placed at right angles to the polar axis D , or the axis of the earth, upon which it moves. 3. The femicircle of declination E , on which the telescope is placed, and moving on the axis of declination, or the axis of motion of the line of collimation F . These circles are measured and divided as in the following table:

Measures of the hours circles and divisions on them.	Hours.	Min.	Divided into	Measures of the declination circles and divisions on them.	Hours.	Min.	Divided into
Azimuth or horizontal circle	5	1	15	30	45th	13500th	
Equatoreal or hour circle	5	1	15	30	45th	13500th	
Vertical femicircle for declination or latitude	5	5	15	30	45th	13500th	

4. The telescope, which is an achromatic refractor with a triple object glass, whose focal distance is 17 inches, and aperture $2\frac{1}{2}$ inches, and furnished with 6 different eye-tubes, so that its magnifying powers extend from 44 to 168. The telescope in the *equatoreal* may be brought parallel to the polar axis, as in the figure, so as to point to the pole star in any part of its diurnal revolution; and thus it has been observed near noon, when the sun has shone very bright. 5. The apparatus for correcting the error in altitude occasioned by refraction, which is applied to the eye-end of the telescope, consists of a slide G moving in a groove or dove-tail, and carrying the several eye-tubes of the telescope, on which slide there is an index corresponding to 5 small divisions engraved on the dove-tail; a very small circle, called the refraction circle H , moveable by a finger-screw at the extremity of the eye end of the telescope; which circle is divided into half minutes, one entire revolution of it being equal to $3' 18''$, and by its motion raises the

the centre of the cross-hairs on a circle of altitude; and likewise a quadrant Q of 13 inch radius, with divisions on each side, one expressing the degree of altitude of the object viewed, and the other expressing the minutes and seconds of error, occasioned by refraction, corresponding to that degree of altitude; to this quadrant is joined a small round level K , which is adjusted partly by the pignon that turns the whole of this apparatus, and partly by the index of the quadrant, for which purpose the refraction circle is set to the same minute, &c. which the index points to on the limb of the quadrant; and if the minute, &c. given by the quadrant exceed the $31' 18''$ contained in one entire revolution of the refraction circle, this must be set to the excess above one or more of its entire revolutions; then the centre of the cross-hairs will appear to be raised on a circle of altitude to the additional height which the error of refraction will occasion at that altitude.

This instrument stands on three feet L distant from each other 14.4 inches; and when all the parts are horizontal is about 29 inches high; the weight of the *equatorial* and apparatus is only 59 lb. avoidupois, which are contained in a mahogany case weighing 58 lb.

The principal adjustment in this instrument is that of making the line of collimation to describe a portion of an hour-circle in the heavens; in order to which, the azimuth circle must be truly level, the line of collimation or some corresponding line represented by the small brass rod M parallel to it, must be perpendicular to the axis of its own proper motion; and this last axis must be perpendicular to the polar axis; on the brass rod M there is occasionally placed a hanging level N , the use of which will appear in the following adjustments.

The azimuth circle may be made level by turning the instrument till one of the levels is parallel to an imaginary line joining two of the feet screws; then adjust that level with these two feet screws; turn the circle half round, i. e. 180° ; and if the bubble be not then right, correct half the error by the screw belonging to the level, and the other half error by the two foot screws; repeat this till the bubble comes right; then turn the circle 90° from the two former positions, and set the bubble right, if it be wrong, by the foot screw at the end of the level; when this is done, adjust the other level by its own screw, and the azimuth circle will be truly level. The hanging level must then be fixed to the brass rod by two hooks of equal length, and made truly parallel to it: for this purpose make the polar axis perpendicular or nearly perpendicular to the horizon; then adjust the level by the pignon of the declination femicircle; reverse the level, and if it be wrong, correct half the error by a small steel screw that lies under one end of the level, and the other half error by the pignon of the declination femicircle; repeat this till the bubble be right in both positions.

In order to make the brass rod on which the level is suspended at right angles to the axis of motion of the telescope or line of collimation, make the polar axis horizontal, or nearly so; set the declination femicircle to 0° , turn the hour-circle till the bubble comes right; then turn the declination circle to 90° ; adjust the bubble by raising or depressing the polar axis, (first by hand till it be nearly right, afterwards tighten with an ivory key the socket which runs on the arch with the polar axis, and then apply the same ivory key to the adjusting screw at the end of the said arch till the bubble comes quite right); then turn the declination-circle to the opposite 90° ; if the level be not then right, correct half the error by the aforesaid adjusting screw at the end of the arch, and the other half error by the two screws which raise or depress the end of the brass rod. The polar axis remaining nearly horizontal as before, and the declination femicircle at 0° , adjust the bubble by the hour-circle; then turn the declination-femicircle to 90° , and adjust the bubble by raising or depressing the polar axis; then turn the hour-circle 12 hours; and if the bubble be wrong, correct half the error by the polar axis, and the other half error by the two pair of eyepiece screws at the feet of the two supports, on one side of the axis of motion of the telescope; and thus this axis will be at right angles to the polar axis. The next adjustment is to make the centre of cross-hairs remain on the same object, while you turn the eye tube quite round by the pignon of the refraction apparatus: for this adjustment, set the index on the slide to the first division on the dove-tail; and set the division marked $18''$ on the refraction-circle to its index; then look through the telescope, and with the pignon turn the eye-tube quite round; and if the centre of the hairs does not remain on the same spot during that revolution, it must be corrected by the four small screws, two and two at a time, which you will find upon unscrewing the nearest end of the eye-tube that contains the first eye-glass; repeat this correction till the centre of the hairs remains on the spot you are looking at during an entire revolution.

In order to make the line of collimation parallel to the brass rod on which the level hangs, set the polar axis horizontal; and the declination circle to 90° ; adjust the level by the polar axis; look through the telescope on some distant horizontal object, covered by the centre of the cross-hairs; then invert the telescope, which is done by turning the hour-circle half round; and if the centre of the cross-hairs does not cover the same object, as before, correct half the error by the uppermost and lowermost of the four small screws at the eye-end of the large tube of the telescope; this correction will give a second object now covered by the centre of the hairs, which must be adopted instead of the first object; then invert the telescope as before; and if the second object be not covered by the centre of the hairs, correct half the error by the same two screws which were used before: this correction will give a third object, now covered by the centre of the hairs, which must be adopted instead of the second object; repeat this operation till no error remains; then set the hour-circle exactly to 12 hours, (the declination-circle remaining at 90° as before); and if the centre of the cross-hairs does not cover the last object fixed on, set it to that object by the two remaining small screws at the eye-end of the large tube, and then the line of collimation will be parallel to the brass rod. For rectifying the Nonius of the declination and *equatorial* circles, lower the telescope as many degrees, minutes, and seconds, below 0° or 180° on the declination-femicircle as are equal to the complement of the latitude; then elevate the polar axis till the bubble be horizontal, and thus the *equatorial* circle will be elevated to the co-latitude of the place; set this circle to 6 hours; adjust the level by the pignon of the declination-circle; then turn the *equatorial* circle exactly 12 hours from the last position; and if the level be not right, correct one half of the error by the *equatorial* circle, and the other half by the declination-circle; then turn the *equatorial* circle back again exactly 12 hours from the last position; and if the level be still wrong, repeat the correction as before till it be right, when turned to either position; that being done, set the Nonius of the *equatorial* circle exactly to 6 hours, and the Nonius of the declination-circle exactly to 0° .

The principal uses of this *equatorial* are,

1. To find your meridian by one observation only: for this purpose, elevate the *equatorial* circle to the co-latitude of the place, and set the declination-femicircle to the sun's declination for the day and hour of the day required; then move the azimuth and hour-circles both at the same time, either in the same or contrary direction, till you bring the centre of the cross-hairs in the telescope exactly to cover the centre of the sun; when that is done, the index of the hour circle will give the apparent or solar time at the instant of observation; and thus the time is gained, though the sun be at a distance from the meridian; then turn the hour-circle till the index points precisely at 12 o'clock, and lower the telescope to the horizon, in order to observe some point there in the centre of your glass, and that point is your meridian mark found by one observation only; the best time for this operation is three hours before or three hours after 12 at noon.

2. To point the telescope on a star, though not on the meridian, in full day-light. Having elevated the *equatorial* circle to the co-latitude of the place, and set the declination-femicircle to the star's declination, move the index of the hour-circle till it shall point to the precise time at which the star is then distant from the meridian, found in tables of the right ascension of the stars, and the star will then appear in the glass. Beside these uses peculiar to this instrument, it is also applicable to all the purposes to which the principal astronomical instruments, viz. a transit, a quadrant, and an equal altitude instrument, are applied. See the description and drawing of an *equatorial* telescope, or portable observatory, invented by Mr. Short, in the Phil. Trans. N. 493. or vol. III. p. 242, &c. And another by Mr. Nairne, vol. III. part i. art. 14. p. 107. See a method of correcting refraction in the use of the *equatorial* by Mr. Dollond in Phil. Trans. vol. LXI. part ii. p. 332, &c.

EQUERY, or ECUERY, a grand stable or lodge for horses, furnished with all the conveniences thereof; as stalls, manger, rack, &c.

The word is formed from the French, *écurie*, which signifies the same thing: Some again derive *écurie* from the Latin, *furis*, which not only denotes a place for beasts to be put up in, but also a grange or barn. But a more probable derivation is from *equus*, a stable for horses, of *equus*, horse.

Some hold that the word *stable*, in propriety, relates only to bullocks, cows, sheep, hogs, &c. and *equery*, to horses, mules, &c.

A simple *equery* is that provided for one row of horses; a double *equery* that provided for two, with a passage

face in the middle, or two passages; the horse being placed head to head, as in the little square at Versailles.

Under square are sometimes also comprehended the lodgings and apartments of the *esquires*, *grooms*, *pages*, &c.

EQUARY, *écurie*, is also an officer who has the care and management of the horses of a king or prince.

EQUERRIES, or **EQUERRIES**, popularly called **QUERRIES**, are particularly used among us for officers of the king's stables, under the master of the horse, seven in number, who, when his majesty goes abroad, ride in the leading-coach, are in waiting one at a time monthly, and have a table with the gentlemen-officers during the time, and a salary of 300*l.* a year each.

They used to ride on horseback by the coach-side when the king travelled; but that being more expensive to them than necessary to the sovereign, it has been discontinued.

EQUERRIES of the crown stable have that appellation, as being employed in managing and breaking the saddle-horses, and preparing them for the king's riding.

There are two in number; the first having an annual salary of 250*l.* and the second 200*l.* whereof one is, or always should be, in close waiting at court; and when his majesty rides, holds the stirrup, while the master of the horse, or one of the *equerris* in his absence, assists in mounting him; and when his majesty rides, they usually attend him.

EQUES *avatus*, is used to signify a knight bachelor, called *avatus*, *q. d. gils*, because anciently none but knights might gild or beautify their armour, or other habilliments of war, with gold.

In law, this term is not used, but instead of it *miles*, and sometimes *chevalier*.

EQUESTRIA, among the Romans, a place in the theatre where the equites or knights sat.

EQUESTRIS, **EQUESTRIAN**, a term chiefly used in the phrase *equestrian statue*, which signifies a statue representing a person mounted on horseback.

The word is formed of the Latin, *eques*, knight, *horsemans*, or *equi*, horse.

The *Fortuna equestris*, in ancient Rome, was a statue of the goddess on horseback. We sometimes also say, *Equestrian Column*.

EQUESTRIAN *cabot*, in Antiquity. See *CONORSEQUITAE*.

EQUESTRIAN *games*, *ludi equestres*, among the Romans, horse-races, of which there were five kinds, the *pedes*, *mens*, or plain horse-race, the *chariot* race, the *decursory* race, about funeral piles, the *ludi* *seculares*, and the *ludi* *septuaginta*.

EQUESTRIAN *order*, among the Romans, signified the order of knights or equites.

EQUILANGULAR, or **EQUILANGULAR**, in Geometry, is applied to figures whose angles are all equal. See **ANGLE**.

A square is an *equilateral* figure. See **SQUARE**. All equilateral triangles are also *equilateral*.

EQUICRURAL, or **EQUICRURAL** triangle, is what we more usually call an *isosceles* triangle.

EQUICULUS, **EQUULEUS**, or **EQUUS** *minor*, a constellation of the northern hemisphere. See **EQUULEUS**.

EQUIDIFFERENT, or **EQUIDIFFERENT**, in Arithmetic, if in a series of three quantities there be the same difference between the first and second as between the second and third, they are said to be *continually equidifferent*; but, if in a series of four quantities there be the same difference between the first and second as between the third and fourth, they are said to be *discretely equidifferent*.

Thus, 3, 6, 7, and 10, are discretely equidifferent, and 3, 6, and 9, continually equidifferent.

EQUIDISTANT, or **EQUIDISTANT**, in Geometry, a term of relation between two things which are every where at an equal or the same distance from each other. See **DISTANCE**.

Thus, parallel lines are said to be *equidistant*, as they neither approach nor recede.

EQUILATERAL, or **EQUILATERAL**, of *æquis*, equal, and *latus*, side, is applied to any thing whose sides are all equal.

Thus, an *equilateral* triangle is that whose sides are all of equal length. In an *equilateral* triangle all the angles are likewise equal.

All regular polygons and regular bodies are *equilateral*. See **POLYGON**, **REGULAR**, &c.

EQUILATERAL *hyperbola*, is that wherein the conjugate axes, as A B and D E are equal. *Tab. Con. fig. 20.*

Hence, as the parameter is a third proportional to the conjugate axes, it is also equal thereto; consequently, if in the equation $y^2 = b x + \frac{b^2}{a}$, we make $b = a$: the

equation $y^2 = a x + a^2$, defines the nature of an *equilateral hyperbola*. See **HYPERBOLA**.

EQUILIBRIUM, or **EQUILIBRIUM**, in Mechanics, a

term implying an exact equality of momentum or force between two bodies compared with each other; and this takes place when their directions are equally opposite, and their masses are reciprocally proportional to the velocities with which they tend to move. See **FORCE**. A balance is in *equilibrium* when the two ends are to be exactly poised that neither of them ascends or descends, but both retain their parallel position to the horizon. From this circumstance the word is originally taken, as being a compound of *æqui*, equal, and *libra*, balance; whence we frequently use the word *balance* in lieu thereof.

The *equilibrium* of fluids make a considerable part of the doctrine of hydrostatics. See **FLUID**.

EQUILIBRIUM, is also used figuratively on other occasions. A painter must take care to observe the *equilibrium* of his figures, i. e. dispose them well on their centre of gravity, that they may not seem ill-supported, or ready to tumble.

Thus, e. g. if one arm be moved forward, the other must be proportionally backward to poise the figure. In a picture there should always be an *equilibrium* between one part and another; that is, the objects are to be distributed so as to balance and contrast each other; and not too many, e. g. be crowded on one side; and the other be left bare.

EQUIMULTIPLE, in Arithmetic and Geometry, is applied to simple magnitudes when multiplied equally, i. e. by equal quantities or multipliers.

Thus, taking A as many times as B, or multiplying them equally, there will still remain the same ratio between the magnitudes thus multiplied as between the primitive magnitudes before multiplication.

Now, these magnitudes thus equally multiplied are called *equimultiples* of the original ones A and B; whence we say, that *equimultiples* have the same ratio as the simple quantities. In arithmetic, we generally use the term *equimultiples* for numbers which contain equally or an equal number of times their *submultiples*.

Thus 12 and 6 are *equimultiples* of their *submultiples* 4 and 2, inasmuch as each of them contains its *submultiple* three times.

EQUINA sella. See the article **SELLA**.

EQUINOCTIAL, or **EQUINOCTIAL**, in Astronomy, a great and immovable circle of the sphere, under which the equator moves in its diurnal motion.

The *equinoctial*, or *equinoctial* line, is ordinarily confounded with the equator; but there is a difference, the equator being moveable, and the *equinoctial* immovable; and the equator being drawn about the convex surface of the sphere, but the *equinoctial* on the concave surface of the æquus orbis.

The *equinoctial* is conceived by supposing a semidiameter of the sphere produced through a point of the equator, and there, by the rotation of the sphere about its axis, describing a circle on the immovable surface of the prism mobile.

Whenever the sun, in his progress through the ecliptic, comes to this circle, it makes equal days and nights all around the globe; as then rising day ead and setting day well, which he never does at any other time of the year. And hence the denomination from *æquis* and *nox*, night, *æquis* *æquus* *diem* *noctem*.

The *equinoctial*, then, is the circle which the sun describes, or appears to describe, at the time of the equinoxes; that is, when the length of the day is every where equal to that of night, which happens twice a year. See **EQUINOX**.

EQUINOCTIAL, in Geography. See **EQUATOR**.

The shadows of those who live under this circle are cast to the southward of them for one half of the year, and to the northward of them during the other half; and twice in a year, viz. at the equinoxes, the sun at noon casts no shadow, being in their zenith.

From this circle is the declination or latitude of places accounted in the degrees of the meridian.

EQUINOCTIAL *points*, are the two points wherein the equator and ecliptic intersect each other; the one, being in the first point of Aries, is called the vernal point, or *æquinox*; and the other in the first point of Libra, the autumnal point, or *æquinox*.

EQUINOCTIAL *circle*, is that passing through the *equinoctial* points. See **CIRCLE**.

EQUINOCTIAL *diel*, is that whose plane lies parallel to the *equinoctial*. See **DIAL**.

EQUINOCTIAL *hours*, *line*, *orient*. See the substantives.

EQUINOX, or **EQUINOX**, in Astronomy, the time when the sun enters one of the *equinoctial* points.

The *æquinoxes* happen when the sun is in the *equinoctial* circle: when of consequence the days are equal to the nights throughout the world, which is the case twice a year, viz. about the 20th of March and the 23d of September, the first of which is the *vernal*, and the second the *autumnal* *æquinox*.

As the sun's motion is unequal, that is, sometimes swifter and sometimes slower (from the causes already explained under the article *EQUATION*) it comes to pass, that there are about eight days more from the vernal to the autumnal equinox than from the autumnal to the vernal, the sun spending so much more time in travelling through the northern than the southern signs. According to the observations of M. Cassini, the sun is $186^{\circ} 14' 53''$ in the northern signs, and only $178^{\circ} 14' 53''$ in the southern. The difference of which is $7^{\circ} 23' 57''$.

The sun, continually advancing forwards in the ecliptic and gaining a degree every day, makes no stay in the equinoctial points, but the moment he arrives in them he also leaves them.

Of course, therefore, though the day the sun enters the equinoctial point is called the equinox, as being reputed equal to the night; yet it is not precisely so, unless the sun enter the equator at mid-day: for if the sun rising should enter the vernal equinox, at rising he will have departed from it, and have got northwards about 12° ; consequently, that day will be somewhat longer than 12 hours, and the night proportionably shorter.

The time of the equinox, i. e. the moment in which the sun enters the equator, is found by observation, the latitude of the place of the observation being given.

Thus, in the equinoctial day, or near it, take the just meridian altitude of the sun; if this be equal to the altitude of the equator, or the complement of the latitude, the sun is at that very moment in the equator: if it be not equal, the difference is the sun's declination. The next day observe the meridian altitude as before, and find his declination; if the declination be of different kinds, viz. the one north and the other south, the equinox has happened in the interval of time between them; otherwise, the sun has not entered the equinoctial, or has passed it at first. From these observations a trigonometrical calculus gives the time of the equinox.

Thus, let DG (Tab. II. *Art. fig. 75*) represent the equator, AC the ecliptic, E the equinoctial point; the points A, B, C, the places of the sun at the times of observation; the arcs AD, BE, CG, the corresponding declinations; in the right angled spherical triangles CEG, BEP, the obliquity of the ecliptic, and the declinations are known; whence may easily be found EC, EB; then BC, the sum or difference of EC, EB, is the ecliptic arc described in 24 hours: then say as BC:BE::24 hours for BC: time for BE; and this time shews the distance of the equinox from the time of the middle observation.

It is found by observation, that the equinoctial points, and all the other points of the ecliptic, are continually moving backwards, or in antecedence, that is, westward. This retrograde motion of the equinoctial points is that famous and difficult phenomenon called the *precession of the equinoxes*. See *PRECESSION of the equinoxes*.

EQUINUS barbarus, a kind of comet. See *HIPPURUS*.

EQUINUS clipeatus and quadrangularis. See *HIPPURUS*.

EQUINUS venter. See *VENTER equi*.

EQUIPAGE, in the *Military Art*, denotes all sorts of utensils, artillery, &c. necessary for commencing and prosecuting with ease and success any military operations. Camp and field equipage consists of tents, kitchen furniture, saddle-horses, baggage, waggons, but-horses, &c.

EQUIPAGE, in *Navigation*. See *CREW*, and *FITTING-OUT*.
Fit EQUIP, in *Naval Language*, a term borrowed from the French marine, and frequently applied to the business of fitting a ship for sea, or arming her for war. See *FITTING-OUT*.

EQUIPOLLENCE, in *Logic*, is when there is an equivalence between any two or more terms or propositions, i. e. when they signify one and the same thing, though they express it differently. Such propositions, &c. are said to be *equipollent*.

EQUIPPE, in *Horology*, expresses a cavalier equipped, i. e. armed at all points.

EQUIRIA, in *Antiquity*, a festival instituted by Romulus, and celebrated on the 27th of February, in honour of Mars, at which there were horse-races.

EQUISELIS, in *Natural History*, the name of a large fly, of the size of a hornet, but having only two wings and no sting; it otherwise much resembles the common hornet in shape. This fly is found only in Macedonia. We have also in England flies which nearly resemble the hornet, wasp, and bee, but in their wanting stings and having only two wings.

EQUISETIS, in *Ichthyology*, a name used by some authors for the hippuris, a sea-fish, caught on the Spanish shores, and supposed by many to be the same with the *DOLADA*, or *CORYTHANA* with the forked tail of Artedi. See *HIPPURIS*.

Vol. II. N^o 118.

FOUISETUM, in *Botany*. See *HORRUM-tail*.

EQUITATA *chorea*, in *Antiquity*. See *CONIUS equitatus*.

EQUITY, *ÆQUITAS*, denotes justice or right, mitigated, and tempered by the consideration of particular circumstances; or a correction and abatement of the severity of some law; or a temperament, which, without being unjust, abates the rigour of some just law.

This is what the Greeks call *ἐπιείκεια*. The utmost severity of a good law is frequently contrary to justice; it should always have equity for its rule and guide. *Somnum ius, iure junctum iustitiam*.

The foundation of equity is not that there is any mistake in the law, but that the law was laid down universally, because all circumstances could not be considered or taken in under one law.

For an instance, suppose it an express law, that the city being now beset with an enemy, the gates be all shut; and suppose it fall out that the enemy is then in pursuit after some of the citizens by whom it is defended, so that it would be highly prejudicial thereto not to open for them the gates; equity here decrees the gates to be opened, contrary to the express word of the law.

Equity is of two kinds, and those of contrary effects; the one abridges, and takes from the letter of the law; and the other enlarges, and adds thereto.

The first is defined the correction of a law, made generally in that part wherein it fails; as suppose a statute made, "That whosoever does such a thing shall be a felon or suffer death;" yet if a mad-man, or an infant, who hath no discretion, do the same, he shall neither be a felon nor suffer death.

The other is defined an extension of the words of the law to cases which are not expressed, which yet come under the same reason; so that when one thing is enacted, all other things which are of the like degree are so too.

Thus, the statute which ordains, that in action of debt against executors, he who appears by distress shall answer, extends by equity to administrators; and such of them as shall appear first by distress, shall answer by the equity of the said act, *quia facti in equali genere*.

EQUITY is also used for the virtue of justice.

EQUITY, in our *Law*, &c. is also frequently used for the court of chancery, where controversies are supposed to be determined according to the exact rules of equity and conscience, by mitigating the rigour of the common law.

Æquitas sequitur legem, is an old maxim in law; but, from the great increase of suits in chancery, some have thought fit to give it this construction, that in all cases after a man has been at law, he must go to equity.

EQUITY of redemption, on mortgages, is that right which a mortgagor has of redeeming his estate upon payment of the money borrowed. If where money is due on a mortgage, the mortgagor is desirous to buy the equity of redemption, he may oblige the mortgagee either to pay the money, or to foreclose of his equity, which is done by proceedings in the court of chancery. But the chancery cannot shorten the time of payment of the mortgage money, where it is limited by express covenant, though it may lengthen it; and then upon non-payment, the practice is to foreclose the equity of redemption of the mortgagor. 2 Vent. 354.

To foreclose the equity, a bill in chancery is exhibited, to which an answer is put in, and a decree being obtained, a master in chancery is to certify what is due for principal, interest, and costs, which are to be paid by the decree, whereupon the premises are to be re-conveyed to the mortgagor; or in default of payment, the mortgagor is ordered to be foreclosed from all equity of redemption, and to convey the premises absolutely to the mortgagee. *Law of Securities*, p. 129, 133.

By stat. 7 Geo. II. cap. 20. after payment or tender by the mortgagor, of principal, interest, and costs, the mortgagee can maintain no clogment, but may be compelled to re-assign his securities.

EQUITY, in *Metaphysics*, sometimes confounded with Justice, a goddess among the Greeks and Romans, represented with a sword in one hand and a balance in the other.

EQUIVALENT, is understood of something that is equal in value, force, or effect, to another.

Æquivalens is of various kinds, in propositions, in terms, and in things.

EQUIVALENT propositions. See *EQUIPOLLENCE*.

EQUIVALENT terms are where several words that differ in sound have yet one and the same signification; as every body was there, and nobody was absent, nihil enim, and omnes.

EQUIVALENT things, are either moral, physical, or financial. Moral, as when we say that the commanding or advising of a murder is a guilt equivalent to that of the murderer.

4 R

Physical.

Physical, as when a man who has the strength of two men is said to be *equivalent* to two men. *Spiritual*, whether a less weight becomes of equal force with a greater, by having its distance from the centre increased.

EQUIVOCAL, *ΕQUIVOCUM*, denotes a word or expression that is dubious and ambiguous, or that may have several senses, one true and another false.

Equivocal terms answer to what are otherwise called *homonymous*, or *homonymous* terms.

Such is the word *equus*, which is both the name of a dignity, the proper name of a person, and the name of a planet. So also the Latin *equus*, which stands indifferently for a steed and a *Franchman*.

In these cases, one word denotes two or more different ideas, or different sorts of objects; whence that common definition of *equivocal* in the schools, *quorum nomen est unum, sed sunt effectus, fundamenta, et nomina diversa*. Philosophers distinguish *equivocal* into *active* and *passive*; or *equivocal* *equivocalis*, and *equivocalis*.

Active *equivocalis*, or those that denominate and signify things, are words common to several things in a very different signification, i. e. to several things which have a similar essence correspondent to the similar denomination. E. g. The word *montes*, which stands for a sign, a mountain, and an animal; and in one signifies a lowing animal; in another, a heap of stones and earth; and in the third, a constellation or system of stars.

Passive *equivocalis*, or those that are called or denominated, are the things signified by ambiguous names, e. g. a sign, a mountain, and an animal; which last species of *equivocalis* alone Aristotle seems to have had in view in his definition, which agrees to these, and these only.

EQUIVOCAL action and cause. See ACTION and CAUSE.

EQUIVOCAL generation, is a method whereby animals and plants are supposed to be produced, not by the usual way of coition between male and female, but by some supposed plastic power or virtue in the sun, &c.

Thus, insects, maggots, flies, spiders, frogs, &c. have sometimes been supposed to be produced by the heat of the sun warming, inspiring, and impregnating the dust, earth, mud, and putrefied parts of animals.

This method of generation, which we also call *fantasmata*, was commonly asserted and believed among the ancient philosophers; but the moderns, from more and better observations, unanimously reject it, and hold that all animals, rays, and vegetables too, are universally produced; that is, from parent animals, and vegetables of the same species and denomination.

It were a thing, one would imagine, sufficient to discredit the Aristotelian, or rather the Egyptian doctrine of *equivocal generation*, to find flies, frogs, &c. to be male and female, and accordingly to reproduce, lay eggs, &c.

The doctrine of *equivocal generation* we call an *Egyptian doctrine*, as having in all probability had its rise in Egypt, to solve the hypothesis of the original production of man, and other animals, out of the earth, by the help of the sun's heat.

To prove which, the Egyptians, as Diogenes Siculus observes, produce this observation, that about Thebes, when the earth is moistened by the Nile, and afterwards impregnated by the intense heat of the solar rays, an innumerable swarm of mice do come forth; whence he infers, that all kinds of animals might equally have arisen out of the earth at the beginning of things; and from these bishop Stillingfleet takes the other writers and adherents to the doctrine of *equivocal generation*, Meli, Pliny, Ovid, &c. to have borrowed the hypothesis with out enquiring into its truth. Deham's Phy. Theol. lib. iv. cap. 15.

EQUIVOCATION, *ΕQUIVOCATIO*, the using of a term or expression that has a double signification.

Equivocation are expedients to save telling the truth, and yet without telling a falsity. The fathers are great patrons of *equivocation* and mental reservations, holding, that the use of such shifts and ambiguities is in many cases allowable.

St. Augustine, particularly, is reproached with endeavouring to vindicate Isaac for saving his wife from a crime by an *equivocation*; *tautit ut quid veri, & non dixit aliquid falsi*. To advance a dubious proposition, knowing it will be understood in a sense different from that you give it in your mind, is an *equivocation*, and a breach of good faith and sincerity.

In moral theology, it is strictly understood of a term or phrase with two different significations, the common and obvious, the other more unusual and remote, the latter of which being understood by the speaker, but the former by the hearers, they conceive something different from one another.

Of this we have an instance in St. John, chap. xi. where our Saviour is represented as saying, *Lazarus sleepeth*;

for the disciples who took the word *sleeping* in the usual signification, concluded that Lazarus, who, they had been told, was sick, began to take rest, and would soon recover; but Jesus, using the word in a less direct and usual signification, meant that Lazarus was dead.

When the *equivocation* consists of several words, it is properly called an *ambiguity*, of which we have an instance in St. John, chap. ii. *Destroy this temple, says Jesus, speaking to the Jews, and I will raise it again in three days*.

The lawfulness of the use of *equivocation* has been greatly disputed among the modern casuists; many grave authors deny that it is allowable to use them on any occasion whatever. Their reason is, that an *equivocation* is to all intents and purpose the same thing with a lie.

EQUULEUS, or *ΕQUULUS*, in *Antiquity*, a kind of rack, or engine of torture, used for extorting the truth; at first chiefly on slaves, but afterwards turned against the Christians.

The patient's arms and legs being fastened on the *equuleus* with cords, he was hoisted aloft, and extended in such manner that all his bones were dislocated. In this state, red hot plates were applied to his body; and he was also goaded in the sides with an iron forked instrument, called *argalea*.

The *equuleus* was of wood, and had holes at certain distances, with a screw, by which the criminal was stretched to the third, sometimes to the fourth or the fifth hole; at intervals, the screw was slackened again, by which he had some respite; but then he was tormented with questions.

The *equuleus* in more ancient times was contrived in the form of a horse; the criminal was laid on his back, and his arms were turned under the breast of the *equuleus*, his hands were bound, and his feet stretched outwards his tail. A rope, fastened to the feet, was made to pass over a smaller pulley between the hind-legs of the *equuleus*, and made to coil over another larger pulley fixed under the belly by means of a handle, which the executioner turned round till all the bones, &c. were dislocated. See a learned dissertation on the form and use of this instrument, by Dr. Ward, in the Phil. Trans. vol. viii. part iv. p. 32, &c.

Hieronymus Magius, when a prisoner among the Turks, wrote an express treatise De Equuleo; and another of Belie, merely as it is said from his memory, without any assistance of books. Sigonius had another treatise on the same subject.

EQUULEUS, *ΕQUULEUS*, and *EQUUS minor*, equi *subit*, the Horse's Head, in *Astronomy*, a constellation of the northern hemisphere, whose stars in Ptolemy's Catalogue are 41, in Tycho's 4, in Hevelius's 6, and in Mr. Flamsteed's 10. The longitude, latitude, magnitude, &c. are as follow:

Names and first letters of the stars.	Right Ascension.	Longit.	Latitude North.	Magnitude.
	14 18 52	20 34 50	1	1
	15 59 37	13 2 30	1	1
	16 2 50	14 16 10	1	1
	16 35 37	11 38 10	1	1
	16 5 24	85 13 14	1	1
Preced. of two in the mouth.	19 7 125	6 12 0	1	1
Subseq. of the same.	20 7 50	44 47 14	1	1
Preced. of two in the head.	18 47 48	20 9 54	1	1
Subseq. in the same.	20 51 52	14 58 6	1	1

EQUULEUS, in *Arti and Manufactures*. See HORSE.

EQUUS, in *Zoology*. See HORSE.

EQUUS marinus, in *Zoology*, a name given by some to an animal very different from the hippopotamus, or river-horse, and more usually known by the name of the *MORSE*.

ERA, in *Chronology*. See *ÆRA*.

ERANDGAAS, in *Ornithology*, the name of a fowl, of the goose kind, described by some authors. It is said to be somewhat smaller than the common wild geese; its head grey, and its neck adorned with a red ring; its breast, wings, and neck, are grey, and its feet red. Mr. Ray much suspects the account of this bird. Ray's Ornithol. p. 208.

ERADICATIVE, in *Medicine*. See RADICAL.

ERANARCHA, a public officer among the ancient Greeks, whose business was to preside over and direct the aims given, and provisions made for the poor.

The word is formed of *ερα*, aim, contributive, and *αρχη*, command.

The *eranarcha* was properly the administrator, or steward of the poor: when any person was reduced to poverty, taken captive, or had a daughter to marry, which he could

could not effect for want of money, &c. this officer called an assembly of friends and neighbours, and taxed each, according to his means and estate, to contribute towards his relief. This is what we learn from Cornelius Nepos in his life of Epaminondas.

ERANTHEUM, in *Botany*, a name given by some authors to the Bos Adonis, or red malva. See *PANACEÆ*.

ERARIUM. See *ERARIUM*.

ERASED, in *Arithmetic*, expresses any thing that comes violently torn off from its proper place. It is used in contradistinction to *casted*, which signifies a thing cast out off. The family of Card bears emine, a demy lion, rampant erased, azure, &c.

ERASTIANS, a religious sect, or faction, which arose in England during the time of the civil war in 1647, thus called from their leader Thomas Erastus, whose distinguishing doctrine it was, that the church had no right to discipline, that is, no regular power to excommunicate, exclude, censure, absolve, decree, or the like.

ERATO, from *ἔραω*, *Love*, in *Mythology*, the name of one of the nine Muses who presided over love-poetry. To this Muse some have ascribed the invention of the lyre and lute; and she is represented with a garland of myrtles and roses, holding a lyre in one hand, and a bow in the other, and at her side a Cupid with his torch. There is also a *NEREID* of the same name.

ERCEUS, of *ἔρκεω*, *optime*, in *Mythology*, the name by which those who were appointed to guard the walls of a city invoked Jupiter.

EREBENNUS, *Ἐρεβένος*, a name given by Galen and some other of the Greek writers, as a distinctive epithet for the black chamæleon thistle, which was esteemed poisonous, and was by this word distinguished from the ægleus or *σίσυμβ*, or white chamæleon, which was an esculent plant, and used by some as an antidote. It has happened, however, that the white chamæleon thistle has been by some called a poison, as well as the black; but this is only owing to a mistake of Pliny, in supposing the effects of birdlime to have been attributed to this plant, because of its yielding a viscous, but safe gum, at its root. It was called by *some* *eris chamæleon*. See *ERIAS* and *CHAMÆLEON thistle*.

EREBUS, *Ἐρεβος*, from *ἔρως*, *night*, in *Mythology*, a term denoting darkness. According to Hesiod, *Erebus* was the son of Chaos and the night, and the father of the day. This was also the name of part of the inferi among the ancients; they had a peculiar expiation for those who were damned in *Erebus*.

Erebus was properly the gloomy region, and distinguished both from Tartarus, the place of torment, and Elysium, the region of bliss: according to the account given of it by Virgil, it forms the third grand division of the infernal world beyond the Styx, and comprehends several particular districts, as the *arctæ inferni*, or receptacle for infants; the *limbus* for those who have been put to death without crime; that for those who have destroyed themselves; the fields of mourning, full of dark groves and woods, inhabited by those who died for love; and beyond these, an open champion country for departed warriors. *Æn. lib. vi. p. 477, &c.*

ERECT flowers, are such as grow upright without hanging or reclining the head. See *FLOWER*.

ERECT half, *erectum solum*, among *Italiasts*. See *LEAF*.

ERECT vision. See *VISION*.

ERECT, areth, and arethine, &c. *areth, &c.* See *DIATH*.

ERECTION, the act of raising or elevating a thing in a right line.

The *erectio* of a perpendicular on a line given, is a popular problem in geometry.

The term *erectio* is also used figuratively; as the *erectio* of a marquise into a duchy; bishopsricks can only be *erect* by the king.

ERECTION is particularly used in *Medicine*, for the state of the penis when swelled and distended by the action of the muscles, called *erectiles*.

There is also an *erectio* of the uterus which is performed by muscles provided for that purpose. See *CLITORIS* and *ERECTORES*.

An alternate state of *erectum* and flaccidity in the penis, Dr. Drake observes, is of absolute necessity; the first to the performance of its office, the second for the security of the part.

Without an *erectio* it were impossible to emit and lodge the seed where it ought to be; and with a constant one, almost as impossible to secure the part from external injuries. To say nothing of the loss of insinuation, which must be a necessary consequence of constant *erectio*.

The *erectio* of the penis consists in a distension of its corpora cavernosa, by an extraordinary quantity of blood sent up thither.

That the blood is the matter which distends the penis in

erectio, is evident from abundance of experiments; though the most convincing is that of firmly tying the penis of an animal (as has been frequently done to a dog) in coitu, wherein nothing has been found but blood to distend it. Hence, in the bodies of criminals, that hang long after death, the penis becomes *erect*; the blood in that position falling to the inferior parts, and stopping there. By blowing into the blood-vessels of the penis after death, the part becomes *erect*. This was first discovered by Mr. Cowper, upon viewing its veins, after he had distended them with wind; whence it plainly appeared, that the external trunks passed, some under its skin only, and some over the ossa pubis; besides, that a vast number of other veins on the dorsum penis unite and empty themselves into one trunk, called *cava penis*, which passes immediately under a transverse ligament of the ossa pubis, which is compressed by the approximation of the dorsum penis to the ligament of the pubis. This application of the dorsum penis is effected by its muscular directedores pulling down the crura of the corpora cavernosa penis, which are tied up at their juncture in the body of the penis to the ossa pubis by the ligamentum suspensorium. Now, this cannot happen to the cavernous body of the urethra, because there is no bone whose position can give rise to a ligament which can have that effect on its veins; wherefore, the muscular directedores embracing the veins of the bulb, do that office, though not so effectually as in the penis itself.

Accordingly the glans is not always perfectly distended with the penis, and it is this part that soonest becomes flaccid on an *erectio*.

The blood by such means being precluded from its return, the corpora cavernosa must of necessity become distended, if we consider their structure above mentioned with respect to the veins. The arteries, which before were flaccid, have now their trunks also distended, and do more plentifully import blood into the corpora cavernosa.

But since it is absolutely necessary some part of the detained blood should be still passing off, lest it become grumous, and unfit for a reflux; the venæ præputi communicate with those of the penis itself, whereby part of the blood may be returned from the penis during its *erectio*, and give way to a fresh supply from the arteria, and preserve the circulation uninterrupted.

ERECTORES uterini, in *Anatomy*, a pair of muscles arising from the protuberances of the ischium, and inserted into the spongy body of the chorion, which they serve to erect in coition. See *CLITORIS* and *CLITORIS*.

ERECTOR penis, in *Anatomy*, a pair of muscles, arising fleshy from the protuberances of the ischium below the beginning of the cavernous bodies of the yard, into whose thick membranes they are inserted.

Their use is to pull the yard upwards towards the ossa pubis, whereby the greatest vein is compressed, and the return blood denied its passage under those bones, which makes it swell. See *ERECTOR*.

EREGMOS, from *ἔρεω*, *I break*, a word used by the ancients, to express a bean decocted and broken into small pieces, in order to be boiled in pottage. This name was not, however, kept strictly to this sense, but they applied it indifferently to all the leguminous fruits broken in the same manner. *Fœtus* will have it to signify *bean-meal*, but others are against this; and Galen in some places uses it only to express a bean divided into two parts.

EREMIT. See *HERMIT*.

ERETHISMOS, from *ἐρεθίζω*, *I irritate*, a word used by Galen and Hippocrates to express any thing that irritates. Galen says that Hippocrates means by it *irritatio* every thing that reduces the habit of body to an infirm state, among which are to be reckoned before all other things, *irritatio*, acrimonia, and pungent humours in the stomach and bowels, particularly in the mouth of the stomach, worms ascending from the intestines into the stomach, nocturnal itchings of the whole skin, or of some part of it, which, by their irritation and prevention of sleep, greatly exhaust strength.

ERETRIA terra, *Eretrian earth*, in the *Matéria Medica*, the name of a very peculiar kind of alkaline bole, dug in the Negropont, near the ancient Eretria, and once in great use as an abstrigent and a sudorific.

The ancient writers in medicine all mention the *Eretrian earth*, and Dioscorides and Galen describe two kinds of it, a grey and white. The grey is what is properly distinguished by this name, being an earth of a different kind from all the other boles. The white, though the ancients seem not to have observed it, yet was plainly, from their own descriptions, the same with the white bole armenia, though found in a different place. *Hill's* *Hist. of Foss. p. 5.*

The grey or genuine *Ericean earth* is a fine and pure greenish white earth, moderately heavy, naturally of a smooth surface, of a friable texture, easily crumbling to pieces between the fingers, but not staining the skin in handling; it sticks firmly to the tongue, but melts to a butter-like substance in the mouth; it burns to a perfect snow-white, and effervesces violently with aqua fortis. But what abundantly distinguishes it from all other earths, is, that if a little be wetted, and drawn over a plate of brass or copper so as to mark a line, the mark will in a little time appear bluish. This is recorded of it so early as in the writings of Dioscorides, and experiment proves it to be true. It seems plainly to be owing to an alkaline quality in the earth; this it plainly manifests by its fermenting so strongly with acids; and it is well-known that alkalies draw a blue tincture from copper.

The ancients all esteemed it a great medicine, and were particularly careful in their way of preparing it for use, by frequent washings. It is now unknown in the shops, but is highly alkaline quality, in which it is so much superior to all the earths now in use, might make it worth the bringing into use again; and it may still be had in its old place, in almost any quantities.

ERGALIA, *Ergalia*, a word used by the *Athenians*, to express that part of their treaties which explains the instruments, employed in their operations.

ERGASIMA, a name given by Dioscorides and other of the ancients to a very foul and coarse kind of myrrh.

ERGASTERIUM, a word used by the writers in *Chemistry*, sometimes to express the whole elaboratory, and sometimes that part of a furnace on which the bottom of the retort, cone, or crucible, is to rest in an operation.

ERGASTINE, *Ergastine*, in *Antiquity*, a select number of virgins employed in weaving Minerva's peplos or robe, which was carried in procession at the Athenian festival *Panathenaeas*. See **PEPLOS**, and **PANATHENAEAS**.

ERGASTULUM, among the ancients, a house of correction, or work-house, where slaves, by the private authority of their masters, were confined and kept at hard labour for some offence. It was likewise called *sepi-narium*.

ERGATIA, *Ergatia*, in *Antiquity*, a Laconian festival in honour of Hercules.

ERGOT, in the *Mange*, is a stub like a piece of soft horn, about the bigness of a cheest, placed behind and below the pattern joint, and commonly hid under the tail of the stock. To *dis-ergot*, or take it out, is to cleave it to the quick with an incision-knife, in order to pull up a bladder full of water that lies covered with the *ergot*. This operation is scarcely practised at Paris, but in Holland is frequently performed upon all four legs, with intent to prevent watery sores and foul ulcers.

ERDOT, in *Medicine*, the name given by the French to a disease similar to one in England, proceeding from eating stilted rice. See *Phil. Trans.* vol. III. part II. and vol. IV. art. 17. p. 106. See **BAHUT** and **SHURT**.

ERLACH, in *Antiquity*, the name of a recompense assigned by the high *Anglo-Saxon law* in case of murder, to the friends or to the child or wife of him that was slain, as a kind of composition between the murderer and his prosecutors.

ERICA, in *Botany*. See **HEATH**.

ERICA marina, *sea-hath*, a name given by many authors to a very beautiful sea-plant of the fucus kind, called by Mr. Ray and some others the *algae erica folia*. This differs so much in bigness in different places, that it has been suspected to be of two distinct species; those plants of it which are found about the shore seldom exceeding ten inches in length, and those in deeper water often growing to three feet.

It is composed of a vast number of ramifications; the bottom stalk is woody, and often of the thickness of a man's little finger; yet even in these there is no distinction of nerves or fibres; the large branches are rough and knotty, and send off many other ramifications, the larger of which are round, but the extreme ones flat.

At different places over this plant, one observes certain knots or tumors; these are no other than the branch in that part swelled, and the use of the swelling is to contain the capsules which enclose the seed; these, and their arrangement in these swellings, are wholly like those of the common fucus, and there are usually ten or twelve capsules contained in every swelling or bladder of the stalk. They are not arranged with any regularity in the swelling, but are always found nearer the upper than the lower extremity of it. The seeds are round, and a very great number of them are contained in every capsule. The swellings which contain these capsules are sometimes placed at considerable distances from one another on the stalks of the plant, and sometimes they stand so close as to represent the beads of a necklace. Some branches of the plant also are very full of them, and others scarce

have any at all upon them. Sometimes the bladders are found empty on this plant, as they are in the common sea wrack; but in this case there may always be seen the marks of the plants where the capsules have once been, though since perished by some acid. Mr. Keomur, who gives this description of this plant, never saw its flowers, but there seems no doubt but that they are composed of short filaments, like those of the other plants of this kind; and he is not examining the plant at a proper season was probably the reason of his not finding them; for the flowers and seeds of these plants are usually both large enough to be seen by the naked eye; and when the seed is so, in most cases the flower is also. *Mar. Acad. Per.* 1712.

ERICA, in *Libbology*, a name given by Cox and some others, as the interpretation of the chalcid of Aristotle, that is, as the name of the common **HERRING**.

ERICERUM, a name given by Avicenna and other authors, to a sort of collyrium, used in weaknesses of the eye, in which the herb *erica* or *hath* was an ingredient.

ERICHTHONIUS, in *Astronomy*, a constellation, the same as **AURIGA**.

ERIDANUS, in *Astronomy*, a constellation of the southern hemisphere, in form of a river.

The stars in the constellation *Eridani*, in Ptolemy's Catalogue, are 341 in Tycho's, 191 in the British Catalogue, 241; the longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and situations of the stars.	Right Ascension.	Longit.	Latitude South.	Magnitude.
First from the turn of the river to the breast of Cetus.	17 45 50 32 46 5	17 45 50 32 46 5	17 45 50 32 46 5	4
A second.	18 17 41 35 34 44	18 17 41 35 34 44	18 17 41 35 34 44	4
First in the river before the breast of Cetus.	18 40 53 38 41 48	18 40 53 38 41 48	18 40 53 38 41 48	4
5.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Preced.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Middle.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Second before the breast of Cetus.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
10.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Third of those following turn of river.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Inform. within the last fucus.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Third before the breast of Cetus.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
11.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Fourth behind the turn of the riv.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Fourth before the breast of Cetus.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6
Fifth behind the turn.	18 50 33 33 33 16	18 50 33 33 33 16	18 50 33 33 33 16	6

ERIFFS, a name given to canary birds when about two years old. See CANARY BIRD.

ERIGENS *penit.* See ERICACEAE *penit.*

ERIGERON, or SENSIC. See GROUNDSEL.

ERINACEA, in *Batany*, the name of a genus of plants, the characters of which are these: the flowers and fruit are the same with those of the broom; but the whole plant is so beset with prickles as to resemble a hedge-hog. Tournef. Inst. p. 646.

According to Mr. Tournefort there are two species.

ERINACEUS, in *Zoology*. See HEDGE-HOG.

ERINACEUS, is also a name given by Dillenius and some other bounists to the pectinated agaries, called by others *hydnium*. These differ from the agaries, properly so called, which are lamellated underneath, and from others which are porous, for these are echinated, or beset with pointed prickles.

ERINGO, in *Batany*. See ERYNGO.

ERINOPTERUS. See PRIVET-FY.

ERINUS, in *Batany*, a genus of the *didymia angiospermia* class. Its characters are these: the flower hath a five-leaved empalement, and one tubular petal, which is of the ringent kind, cut into five equal segments, and is short and reflexed: it hath four flamina situated within the tube, two of which are a little longer than the other. In the bottom of the tube is situated an oval germen, which afterwards becomes an oval capsule, with two cells filled with small seeds. Miller. There are four species.

ERIOCAULON, in *Batany*, a genus of the *triondia trigyna* class. The characters of which are, that the calyx is common; that it has a small imbricated head, three equal petals, and the flamina above the germen. There are five species.

ERIOCEPHALUS, in *Batany*, Dill. Hort. Elth. 110. a genus of the *fringensia polygamia nectifera* class. Its characters are these: it hath a radiated flower, composed of female half florets, which form the rays, and hermaphrodite florets which form the disk: the hermaphrodite flowers are funnel-shaped, and cut into five parts at the brim, and have five flamina, with a naked germen. The female florets have their petals stretched out on one side like a tongue, divided at the end into three small lobes; they have no flamina, but an oval naked germen: they have one naked seed sitting on the naked

Vol. II. N° 118.

plain receptacle: There are three species. These plants retain their leaves all the year, and so add to the variety of exotics in the winter season.

ERIOPHORUM, in the Linnaean system of *Batany*, the name of the cotton-grass, or cotton-rush, common in marshy places, and called *linagress* by other writers. This is, by that author, made a distinct genus of plants, of the *triandria monogyna* class, whose characters are, that the flower-cup is an imbricated spike, made up of oblong oval scales, a little bent in, and separating the flowers: it has no petals; the flamina are three capillary filaments; the anthers are erect and oblong; the germen of the pistil is extremely small; the style is thread-like, and of the same length with the scales of the cup; the stigmata are three, longer than the style, and bent backward; the seed is three cornered, pointed, and covered with hairs longer than the spike. There are five species.

ERIOPHORUS, in *Batany*, a name given by Valiant to a genus of plants, since described by Linnaeus under the name of *andryala*. See ANDRYALA and Sea-THISTLE.

ERIOX, or EROX, in *Ichthyology*, a name given by Albertus and some other authors to the common salmon, called by others, *amurege*, and *salmo*. See SALMON.

ERISTALIS, in *Natural History*, the name of a stone, mentioned by Pliny and the ancients, and of which a very memorable quality is recorded by them, which is, that though it was naturally white, it would occasionally turn red.

ERISTICI, from *eris*, *difficilis*, in *Batany*, such authors as have attempted the study of that science in a philosophical way, and have been publicly engaged in disputes about the true foundation of its several distinctions, &c.

ERITHACE, a name given by the ancients to the yellow matter collected on the hinder legs of the bees after their excursions in search of the materials for their hives; we usually esteem this to be real wax, and the French call it *cire brute*, or *rough wax*: it is certain, however, that though the matter of which wax is to be formed is contained in this substance; yet the Dutch and some other nations have the most just idea of it, in calling it *pain de abricot*, or *the flesh of the bee*.

This substance is only the farina of flowers, and no experiment has been able to separate real wax from it. The most probable opinion concerning it is, that it serves the bees as food, and that after this it is converted in their bowels into the substance called wax.

ERITHALIS, in *Batany*, a genus of the *pentandria monogyna* class. The corolla is divided into five segments, the calyx is accreted, and the fruit is a berry consisting of ten cells. There is one species.

ERMESIA, a name given to a composition used among the ancients, and famous for its effects in making people forget troublesome children. It consisted of honey, myrrh, saffron, and palm-wine, all beat together. This draft was to be taken mixed in milk. The women took it as well as the men, and many had great faith as to its effects.

ERMIN, or ERMINE, in *Irraly*, denotes a white field or fur, powdered or interpergered with black spots, called powdering. See FUR.

It is supposed to represent the skin of an animal of the same denomination. In effect, there is no animal whose skin naturally corresponds to the herald's *ermine*.

The animal is milk white, and so far is it from having spots, that tradition reports, that it will rather die, or be taken than fully its whiteness. Whence its symbolical use. But white skins having for many ages been used for the linings of the robes of magistrates and great men; the furriers at length, to add to their beauty, used to few bits of the black tails of these creatures upon the white skins, to render them the more conspicuous. Which alteration was introduced into armory. See TAB. II. Herald. fig. 60.

The fable spots in *ermine* are not of any determinate number, but they may be more or less at the pleasure of the painter or furrier.

ERMIN, an order of knights, instituted in 1459, by Francis I. duke of Bretagne, and formerly subsisting in France. The collar of this order was of gold, composed of ears of corn in saltier; at the end of which hung the *ermine*, with this inscription, *a mai vis*. But the order expired when the dukedom of Bretagne was annexed to the crown of France.

ERMIN. A *crisp ermin* is a cross composed of four *ermine* spots, placed in the figure represented Tab. II. Herald. fig. 62.

It must be observed, that the colours in such arms are not to be expressed, because neither the cross nor the arms can be of any colour, but a white and black.

Colombiere blazonneth *un croce ermine en croce*. The editor of Gaullin describes it thus; a cross of four

ermis; or, more properly, four *ermis* spots in cross. It is the coat of Hutton in Cheshire.

ERMIS, *tribune* of. See **TRIBUNE**.

ERMINES, is used by some English writers for the teneat of *ermine*, i. e. for white spots on a black field; but on what foundation nobody can tell; for the French, from whom we have our heraldry, have no such term; but call this black powdered with white, *contre-ermine*, as denoting the counter, or reverse of *ermine*; which is white powdered with black. See *Tat. II. Herald. fig. 63*.

ERMINIUM *animal, furs, or ermine*, the creature whose skin is the *ermine*, is much esteemed as a fine fur. See *Tat. Spec. N.º 6*.

This creature is properly a species of weasel, and is called by Mr. Ray, and other authors, *Mustela canidia*, the *white weasel*, and by Linnaeus *Mustela erminea*. It is in all respects like the common weasel, and is all over of a pure snow white, except the tip of the tail, which is of a beautiful black, and that it has a little yellowish grey about the eyes, and a mark, or spot, of the same colour on the head, another on the shoulders, and a third, near the tail. Its colour is, however, very different in degree and elegance, according to the season of the year. It is frequent about rivers, and in meadows, in those countries which produce it, and feeds on moles, mice, and other small animals. The skins and tails are a very valuable article of commerce in Norway, Lapland, and Russia, and other cold countries, where they are found in prodigious numbers, and regularly change their colour in winter, becoming white. In Siberia, they burrow in the fields, and are taken in traps, baited with flesh. In Norway they are shot with blunt arrows, or taken in traps. The *skin* is sometimes found white in Great Britain, and called the *white weasel*.

ERMINITES should form a diminutive of *ermine*, and naturally to signify little *ermine*; but it is otherwise. *Erminites* expresses a white field powdered with black; only that every spot has a little red hair therein.

Some authors use the word *ermine*, for a yellow field powdered with black; which the French express much better by *erminé d'ermine* or *ermine de faulx*.

ERMINOIS expresses an field, with sable powdering.

ERNES, in our *Old Writers*, signify the loose feathered ears of corn that are left on the ground, after the binding or cocking of it.

It is derived from the old Teutonic *ernde*, harvest; *erden*, to cut or mow corn. Hence *ernis*, in some places, tagleat.

ERODINUM, a word used by some of the enthusiastic writers in alchemy, to signify the prognostic, good or bad of any operation.

EROS, of *eros*, *love*, in *Mythology*, one of the two chiefs over all the other Cupids, being the cause of love. See **ANTEROS**.

EROSION, in *Medicine*, the act of sharp, acid fluids, or humours, growing or tearing off parts from the flesh, and other substances. Arsonic, and other poisons, make *erosion* in the intestines. See **CORROSION**.

EROSUM, *sulium*, among *Batani*. See **LEAF**.

EROTESIS, *Erotesis*, in *Rhetoric*, the same with **INTERROGATION**.

EROTIA, *Erastia*, a festival among the Greeks, in honour of Cupid, being celebrated every fifth year with sports and games.

EROTIC, derived from *eros*, *love*; whence *erotico*, is applied to any thing which has a relation to the passion of love.

In *Medicine*, we particularly use the phrase *delirium eroticum*, for a kind of melancholy contracted through excess of love.

Though among the several species of pulses, there be no amorous pulse, that is, no pulse peculiar to that passion; yet we can certainly discover where the disorder is *erotic* by the beating of the pulse, which, in that case, is changeable, unequal, turbulent, and irregular. Speak to the patient of the person he loves, and his pulse instantly changes, becoming higher and quicker; and the minute you change the conversation the pulse is lost again, and is disturbed anew.

EROTIDIA, *Erastidia*, the fame with *erotia*.

EROTYLOS, in *Natural History*, the name of a stone, of which we have no description left us, but which the ancients are said to have used in divination.

EROWA, the name of a kind of nettle which grows in the mountains at Otsebe in the South Sea, with which the inhabitants make fishing lines, which serve to hold the strongest and most active fish, and are much stronger than our silk lines of twice the thickness.

ERRANT, in *Law*, the same with *itinerant*; the term is attributed to judges who go the circuit; and to bailiffs at large.

ERRANTS, *knights*. See **KNIGHT**.

ERRATA, a list usually placed at the beginning or end of

a book, containing the faults that have elapsed in the impression, and, sometimes, even in the composition of the work.

Landenberg has an express dissertation on typographical errors, *De Erroribus Typographicis*; wherein he observes, that there is no book exempt from them, not even the sacred books. He sets himself to enquire into all the causes thereof, and proposes means to prevent them. But he advances nothing on that article, but what is either common or impracticable.

ERRATIC, in *Astronomy*, an epithet applied to the planets, which are called *erratic*, or wandering stars, in opposition to the fixed stars.

ERRATIC fevers, in *Medicine*, a term used to express such fevers as, according to the language of medical writers, observe no regular type, that is, are not determined either in their attacks or in their general period. They are thus called by way of distinction from the type fevers, which are regular in both. See **FEVER**.

ERRATIC words. See **WIND**.

ERRHINA, *Ephra*, from *er*, in, and *er*, nose, in *Medicine*, are remedies taken by the nose to enliven the spirits, stop bleeding, &c. but principally to purge the humidities of the head, and by the general shock they occasion, to remove the most distant obstructions. Hence reflects their use in lethargies, epilepsies, palfies, apoplexies, head-achs, vertiges, catarrhs, gutta serena, &c. Of these, some are taken in powders, as betony, tobacco, marjoram, iris, white hellebore, euphorbium, &c. Others in a liquid form, made of the juice of marjoram, sage, beer, cyclamen, iris, &c. Others in form of liniments, incorporated with unguent. rofat. Others solid, so-mad like pyramids, to stop bleeding at the nose; composed of Armenian bole, terra sigillata, mastic, human or hog-blood dried, &c. Such *errhina* as are dry, and made up in powders to excite sneezing, are properly called *sneezaturia*. Some moderns call them *caputurina*.

ERRIPSIS, from *eripere*, *to precipitate*, in *Medicine*, is used in different senses, sometimes for a weakness of the whole body, sometimes only of some one part. When applied to the whole body, it expresses that utter dejection and prostration of strength which makes a man fall down like a dead carcass; and, when applied to the eyes, it expresses such a debility, as renders it impossible to keep them open.

ERROR, a mistake of the mind, in giving assent to a thing, or proposition, which is not true. See **FALLACY**.

Some philosophers define *error* an act of the mind, whereby things that should be joined, are separated; or, things that should be separated, are joined; or a wrong judgment, disagreeing with the things whereon it is passed.

Error stands in opposition to *truth*, which consists in an agreement between the proposition, and the thing whereof it is affirmed or denied.

However, a bare failure, or non-attainment of truth, doth not constitute *error*; that being common both to ignorance and doubting.

Error only stands distinguished from *folly*, in that the former is in the mind, and the latter only in the proposition.

The great origin of all *error*, i. e. of believing that to be true, which is false, is a liberty or power, in the human mind, of giving its assent to ideas, or propositions, that are obscure, as if they were perspicuous and plain.

Particular causes of *error* are, inactivity, ignorance, impotence, interest, authority, education, &c. See **FAITH**, **PROBABILITY**, **OPINION**.

Against all which, there is this one general rule or caution laid down, by F. Malebranche and others; viz. never to give our full assent to any proposition, unless the evidence for it be so strong, as that we can no longer with hold it, without incurring the secret reproaches of our own reason.

Mr. Locke reduces the causes of all our *errors* to these four; viz. 1. Want of proofs. 2. Want of ability to use them. 3. Want of will to use them. And, 4. Wrong measures of probability.

F. Malebranche considers five occasional causes of *error*, or rather five different kinds of *errors*, accommodated to the different manners we have of perceiving things. 1. *Errors of sense*. 2. Of the imagination. 3. Of the understanding. 4. Of our inclination. And, 5. Of the passion. See **SENSE**, **IMAGINATION**, **UNDERSTANDING**, **INCLINATION**, and **PASSION**.

ERRORS, *popular*. See **POPULAR**.

ERROR, in *Law*, generally denotes a fault, or oversight, either in pleading, or in process; upon either of which is brought a writ by way of remedy, called a writ of *error*; in Latin, *de errore corrigendo*.

Fitzherbert defines a writ of *error* to be, that which lies to redress false judgment given in any court of record, having

having power by charter, or prescription, to hold plea of debt of trespass of above twenty shillings. There is also a writ of error for reversing a fine, &c.

ERRORS, to offend. See **ASSIGNING**.

ERRORS, clerk of the. See **CLERK**.

ERRORS, *in* a term often used by Boerhaave. This author observes, that in the body there is a descending series of vessels; by which he means, that the first orders of the vessels are adapted to receive the red globules of the blood, while the rest are, perhaps, smaller and receive only the serum, the next in order the lymph, and the next the yet finer fluids. Now when the red globules of blood are propelled into the vessels destined only to receive the serum, or when the serum goes into those vessels, in which a finer fluid ought only to circulate; this he calls an *error lesi*, and attributes much to it.

ERUGA, *in* Zoology. See **CATERPILLAR**.

ERUGA, *in* Botany. See **APHRODITA**.

ERUGA, *in* Botany. See **ROCKWORT**.

ERUCAGO, *in* Botany. See **BUNIA**.

ERUCTION, *in* Botany, the same as **RUCTION**.

ERUDITION, denotes learning, or knowledge, and chiefly that of history and antiquity, of languages and of books; which is the result of hard study, and extensive reading. The Salliers were men of deep *erudition*; the writings of M. Launoy, a priest of the Oratory, are full of *erudition*.

Mr. Locke says, it is of more use to fill the head with reflections, than with points of *erudition*. If the mind be not just and right, ignorance is better than *erudition*, which only produces confusion and obscurity. M. Balzac calls a heap of ill chosen *erudition*, the luggage of antiquity.

ERUPTION, in general, a bursting forth, or exclusion of something that was before covered and concealed.

In Medicine, it denotes a sudden and copious excretion of humours, as pus or blood, and any breaking out of pustules or spots in various disorders; as in the small-pox, measles, plague, fever, &c. See **ERANTEMMA**.

The *eruption* of volcanoes, or burning mountains, is frequently the effect, and issue, of earthquakes. See **EARTHQUAKE**, &c.

The *eruptions* of mount *Ætna*, and *Vesuvius*, are observed to be somewhat periodical: they are of two kinds; the one less violent, happening once in two or three months, and lasting usually three or four days without much damage to the adjacent country. The other more furious, and of longer continuance, happening to mount *Vesuvius* about once in eighty years. That in 1362 was so violent, that by the beil of St. Peccacio's observations, it call the rocks three miles into the air. Harrop, in Phil. Trans. N^o 202.

The honourable Mr. Hamilton has communicated several accounts of later *eruptions* of *Vesuvius* to the Royal Society, which may be seen in the Phil. Trans. for 1767, 1768, and 1769. He observes that the violent *eruption* in 1767, is reckoned to be the twenty-seventh since that which destroyed Herculaneum and Pompeii, in the time of Titus. See **VOLCANOS**.

Mr. Oldenburg gives us an historical account of the several *eruptions* of mount *Ætna*, recorded in authors. The first whereof we have any credible account, was at the time of the expedition of *Æneas*, described by Virgil, *Æneid*. lib. iii. The second, described by Thucydides, was four hundred and seventy-six years before Christ. In the time of the Roman consuls there were four; another in *Cæsar's* time, so fierce, that *Dioclus* assures us, the ships near the island of *Lipari* were injured with the extreme heat of the water; another under *Caligula*; another at the time of the martyrdom of St. Agatha, said to have been stopped at her intercession; another in the year 813; several between the years 1160 and 1169; others in 1284, 1320, 1408, 1444, 1576, 1633, 1650. Phil. Trans. N^o 46.

Another extraordinary *eruption* happened in 1609, particularly described in the said Transactions, N^o 51: it was preceded for the space of eighteen days, with a dark thick sky, thunder, lightning, and frequent concussions of the earth: the place of the *eruption* was twenty miles from the old mouth. The matter here yielded, was a stream, or river, of melted metals and minerals, rendered liquid by the fierceness of the fire, and boiling up, and gushing forth, as water does at the head of some great river; till having run in a full body for a stone's call, or more, the extremity thereof began to crust and curdle, and turned, when cold, into hard, porous stones, called *fiarri*, as resembling huge cakes of sea-coal, full of a fierce fire. These came rolling and tumbling over one another, and where they met a bank, wall, building, &c. would fill up, and swell over; by their weight bearing down any common building, and burning up what was combustible. The

progress of this foundation was at the rate of a furlong a day; which it continued for fifteen or twenty days, running, at first, into the sea, but afterwards into the city of *Catania*; in its course it overwhelmed fourteen towns and villages, containing three or four thousand inhabitants. The noise of the *eruption* at the mouth was heard sixty miles.

Dr. St. Clair, in the Philosophical Transactions, gives an account of a constant *eruption* of fire on one side of one of the Apennines, between Bologna and Florence; a spot of ground three or four miles in diameter, he observes, incessantly sends up a flame, rising very high, without noise, smoke, or smell, though it gives a very great heat. In great rains it sometimes intermits, but rekindles with greater vigour and heat. Within three or four yards of it, he adds, there grows corn. The flame, he conjectures to arise from a vein of bitumen, or naphtha. There are three other such fires on the same hills.

ERUPTIONS *in* infants. See **INFANTS**.

ERUPTIVE *fever*. See **FEVER**.

ERYVUM, *in* Botany, a genus of the *diadelphica* class: the characters of which are, that the corolla of the flower is divided into five equal parts, which end in acute points; the flower is of the butterfly kind, having a large, roundish, plain standard, two obtuse wings, of half the length of the standard, and a shorter keel, which is pointed; it hath ten stamina, nine joined, and one separate, terminated by single filaments; it hath an oblong germen, supporting a rising style, crowned by an obtuse stigma; the germin afterwards becomes an oblong, taper pod, jointed between each seed. There are six species.

ERYVUM orientale. See **SOPHORA**.

ERYCINA, *in* Mythology, a surname given to Venus, from *Erix* a mountain in Sicily, where she had a temple. Venus *Erycina* had also a temple at Rome, which was deemed very ancient, even in the time of Thucydides.

ERYNGO, or SEA-HOLLY, *Eryngium*, *in* Botany, a genus of the *pentandria digyna* class. Its characters are these: it hath many small flowers, sitting upon one common conical receptacle; the flowers have a five-lobed erect empalement, sitting upon the germin, and form a roundish general umbel, which is uniform; each flower has five oblong petals, and five stamina, standing above the flowers; under the empalement is situated a prickly germin, which afterward becomes an oval fruit divided into two parts, each having one oblong, taper seed.

There are several species of the *eryngium* plant propagated in the gardens of the curious; but the common sea-kind is the only one of any use. The roots of this are, in great quantities, both dried and candied in the shops; they may all be propagated, either by parting their roots, or sowing their seeds; but the first is the most convenient and expeditious method. This is to be done in autumn, when the leaves decay, and the soils they most delight in are gravel and sand; but in dry seasons they require a great deal of watering. The second year after their removal from the old plant, they will flower, but the flowers are not so strong as in the older plants. They spread very much at the root.

The true *eryngium* has creeping roots, which run deep into the ground; the leaves are roundish, stiff, and of a grey colour, set with sharp spines on the edges; the stalks rise a foot high, and divide upwards into two or three; they are smooth, and garnished at each joint with leaves of the same form as the lower, but smaller, and embrace the stalks with their base; at the end of the branches come out the flowers in roundish prickly heads; under each is situated a range of narrow, stiff, prickly leaves, spreading like the rays of a star; the flowers are of a blue whitish colour; they appear in July, and the stalks decay in autumn.

The root of *eryngium* is attenuant and deobstruent, and is therefore esteemed a good hepatic, uterine, and nephritic. Its whole virtue, it is to be observed, consists in the external or cortical part. The virtues, however, appear to be but weak; and they are now scarcely otherwise used than as made into a sweetmeat.

The London College directs it to be candied in the following manner: boil the roots till the rind will easily peel off; when peeled, slice them through the middle, and the pith being taken out, wash them three or four times in cold water; then for every pound of roots thus prepared, take two pounds of double refined sugar; dissolve the sugar in water, set it on a fire, and as soon as it begins to boil, put in the roots, and continue the boiling till they become soft.

These candied roots are an ingredient in artificial asses milk, which is thus made: take of candied *eryngium* root, one ounce; pearl barley, half an ounce; liquorice root, three drams; boil them in two pints of water to one pint, to which add a pint of new milk from the cow; boil

boil them gently together, then strain the liquor for use, of which half a pint should be drank three times a day.

ERYNGIUM is also a name given by some of the old authors, to aloes; a medicine as different from the root of this name as any one thing can well be from another.

ERYNNIS, or **FORIOUS**, a name given to Ceres by the Sicilians.

ERYSIMUM. See *Hedge Moltard*.

ERYSIPELAS, *ΕΡΥΣΙΠΕΛΑΣ*, in *Medicine*, a disease of the skin, called also *jaier ignis*, and *St. Antony's fire*; and in many parts of Great Britain, the *erys*.

In an ancient instrument belonging to the church of St. Antony at Marcellis, this disorder is called *ignis infernalis*, or *fire of hell*.

The word is formed of the Greek, *ερυσ*, *trahere*, to draw, and *πελας*, *prop*, near; whence it is also called by the Latins *vicinistrata*, and *vicinistrata*. Others derive it from *ερυσ*, red, and *πελας*, food, or blast.

The language and phlegm, young people, and pregnant women are most subject to this disorder.

Dr. Quincy accounts for the *erysipelas*, from a too free blood, which, obstructing the capillaries, occasions inflammations; others, from a too sharp and bilious blood, which, on account of its great subtilty, occasions no sensible tumor, but spreads, or diffuses itself, all around; and from the humours not being duly discharged by perspiration. The colour of the tumor, though red, generally inclines towards a yellow, on account of the mixture of the bile; and always the more there is of the bile, the more dangerous the disease.

This disorder may be occasioned by any thing that overheats the blood, checks perspiration, and obstructs or diminishes either the natural or artificial evacuations.

In *erysipelas leues*, which are justly ranked among the exanthematic kind, the blood and humours being in an intense motion, an acrid serum of the sulphureous and caustic nature is, by that means, propelled to the surface of the body, and produces a swelling, accompanied with redness, heat, and pain.

This fever is far from being innocent and simple, as it is generally thought, and is often violent and dangerous, may mortal, and, in some cases, appears to be nearly allied to peticular fever, the most formidable of all disorders. The symptoms in both are of the same kind; and on the third or fourth day the morbid matter in both is thrown out to the surface, and the violence of the symptoms of this somewhat abates. But the great difference is, that the one is contagious, the other not so, and the peticular is much more fatal than the other usually is found to be.

Physicians distinguish the *erysipelas* into two kinds, the simple and the scorbutic. The simple or genuine *erysipelas* affects only the surface of the body, and easily gives way to proper remedies, in a short time; but the scorbutic, or scorbutic kind, is more deeply rooted, and hard to be removed; there is also a third kind, called an exacerated *erysipelas*, in which the eruptions are yellow, and contain an acrid pungent humor, which gives a terrible gnawing pain. This disease affects every part of the body, but particularly the legs and face, especially the latter; and happens at all times of the year, but most frequently at the close of summer. It sometimes spreads over the whole face, and swells and inflames it in such a manner as to endanger suffocation; being attended with an intense pain, and a number of little pustules, which, as the inflammation increases, become vesicles. It often seizes people in a moment, while they are abroad, and is called by the country people a *blast*, or *blastia*, because they imagine it proceeds from foul air, or ill wind; but it is generally occasioned by cold caught after the body has been greatly heated or fatigued. It, in reality, differs very little from the effects of the stings of wasps and bees, except that the heats often rise into pustules. One kind of *erysipelas* wholly resembles the stinging of nettles; this is usually brought on by drinking and is very troublesome, the pimples appearing and disappearing at times, sometimes for a long while together.

Emmeller gives it as the distinguishing character of an *erysipelas*, that when pressed very lightly by the finger, there follows a white spot, which presently after becomes red again, which does not happen in an ordinary inflammation, unless when violently pressed. Scorbutic people are most subject to this disease. It is disputed, whether purging be good in the *erysipelas*. Sydenham recommends it the next day after bleeding. Emmeller cautions us against them both, and recommends diaphoretics. Dr. Keil observes, that in the last stage of an *erysipelas* of the head, attended with a coma, delirium, &c. unless cathartics will do good, the case is desperate. All unctuous, astringent, and cold applications, externally, are dangerous, and sometimes make the *erysipelas* degenerate into a gangrene.

However mild the more common kinds of this disorder may naturally be, yet ill management will make even the slightest of them dangerous; and the striking of the eruptions in has been often known to be of fatal consequence. Hoffman mentions a patient he knew, who by taking a vomit, and a drastic purge, in the time of the eruption, had an inflammation of the stomach brought on, and died in a few days. In many kinds of the *erysipelas*, nature does much, and with a little proper assistance, the whole terminates kindly in a short time; but the bad kinds, nay, and too often the best, when treated unduly, turn to violent burning fevers, and the eruptions to gangrenes.

The true method of curing *erysipelas* consists in three intentions: first, that the fibrile motion of nature be by no means hindered, but rather promoted if it be found defective, and only reduced to a due temperament, if excessive. Secondly, that the fibrile caustic matter be corrected and prepared for secretion and excretion; and thirdly, that the inflammatory stagnation of putrid and caustic lymph in the external parts be dissolved, and perfectly expelled. Bleeding in an *erysipelas* is sometimes beneficial, sometimes hurtful, and a good general rule is to order it in plethoric habits, and for persons accustomed to drink spirituous liquors, and when the disease attacks the head, but to forbid it in others. In cases where bleeding is necessary, the body should be kept open by emollient clysters, or small doses of nitre and rhubarb. When the inflammation is mild and gentle, it may sometimes be removed by external warmth alone; but when it is more violent, it requires the help of internal, and sometimes external remedies. Of the internal kind, the *mistura simplex* is one standing good medicine; and of the external, an ointment made of elderbark, or the rob of elder, is known to have performed great cures; though ointments and plasters tend rather to obstruct and repel than to promote any discharge from the affected part. Fine wool, or soft flannel, are the softest applications, which, by defending from the cold air, and promoting perspiration, have a great tendency to remove the disease. Bathing the feet and legs in warm water is of considerable service, when the disorder has seized the face or brain; and if these fail, pulvices, or sharp fuscipians, applied to the soles of the feet, may be more effectual.

In the scorbutic *erysipelas*, gentle laxatives will be proper, and such things as purify the blood, and promote the perspiration. When the inflammation has been checked by opening medicines, a decoction of farsapilla root, fumigations of guaiacum, balsams, and liquors, may be drank, and succeeded by a course of bitters.

There is, beside the common kinds of the *erysipelas*, yet one more to be mentioned, which is always very terrible, and often fatal: this is an *erysipelas* of the lungs. In this case the patient is seized with a highly burning fever, and an acute pain, both in the anterior and posterior parts of the body, but especially about the spine. He always holds his neck straight upright when he breathes; and his nostrils dilate with an excess of heat and pain, and in the more advanced stages, his tongue hangs out of his mouth like that of a dog that pants with heat; a dyspnoea. He vomits sometimes bile, and at other times phlegm, and is subject to very frequent faintings; he coughs much, and either spits not at all, or else a yellowish or bloody matter. This disease almost always proves mortal; and the only accident that can give the patient the least hope, is its quitting the internal parts, and shewing itself on the surface.

Heister thinks, that the grand intention, in the curing of this disorder, must be to dilate the infiltrated blood, and break and divide it where it stagnates, and is obstructed. Plenty of thin and weak drinks are therefore to be administered, by which a gentle and lasting sweat may be excited, and the relaxant powders, and nitrous mollicies are frequently found also to have great and good effects. If the inflammation be but very slight, it is often cured by external warmth; but when warmth alone does not prove sufficient, cloths, with the rob of elder, spread upon them, are found of great benefit, being laid warm on the part, and kept on by warm compresses, and the proper bandages. Ointments made of the middle green bark of elder, are also very beneficial; and notwithstanding that many do not approve the practice, yet spirit of wine camphorated, with a mixture of saffron and Venice treacle, are found often of very great service, applied warm, with coarse paper or with linen rag; and a mixture of lime-water, and spirit of wine camphorated, often does great service. It sometimes happens, that an *erysipelas* comes to suppuration; and from this generally arise the most untractable spreading and eating ulcers. In this case the ulcer is to be carefully cleaned, and dressed with ointments of cerufs, red lead, or litharge, and plasters of the same ingredients; and the patient must,

mud, at the same time, take internal remedies to sweeten the blood, remove gravel, &c. and observe a strict regimen in regard to diet. Heister's Surgery, p. 193.

If the black, livid, or blue colour of the diseased part shows a tendency to mortification, the Peruvian bark may be given in the quantity of a dram every two hours, when the symptoms are threatening; and cloths dipped in warm camphorated spirits of wine, or the tincture of myrrh and aloes, or posulides of the bark, may be applied to the part, and often renewed; or it may be fomented with a strong decoction of bark.

Those who are subject to frequent attacks of the erysipelas should guard against violent passions, strong liquors, and fat, starchy, and highly nourishing food. They should use sufficient exercise, and avoid the extremes of heat and cold. Their food should be chiefly milk and vegetables; and their drink small beer, whey, better-milk, &c. They should prevent too long a state of coarctation, either by salable diet, or by often taking a gentle dose of rhubarb, cream of tartar, lenitive electary, or some other mild purgative. See Todd's Advice, p. 288, &c. Bochen's Dom. Med. p. 270, &c.

ERYSIPELATOIDES, from *erysipelas*, and *oides*, *likeness*, in *Medicine*, is a swelling like that of the *erysipelas*, though with other symptoms; and therefore may be taken for a kind of *erysipelas*; in this the skin is of a more dark colour.

ERYTHREAN, an appellation given to Hercules, from a temple which he had at Erythrae, in Asiae.

ERYTHREAN Styl. See *Styl.*

ERYTHREMA, a word used by the old writers in *Medicine*, to express a redness of the cheeks, occasioned by the violent heat in fever. Some also have applied the same word, in the plural number, to the red inflammatory eruptions in an *ERYSIPELAS*.

ERYTHRINA, in *Botany*, a name given, by Linnaeus, to a genus of lupinoid vegetables, called by Tournefort, *Dilennas*, and the generality of other writers, *CORALLI-ROSEUM*, and *CORAL*.

ERYTHRINUS, in *Ichthyology*, the name of a fish, called by some authors also the *rubellus*, *travelling*, and *albus*, or *arbut*, by the Venetians. It is a small fish, something like the *surra*, or gilt-head, in shape, but much smaller, and of a pale red colour all over. Its tail is forked, its nose sharp, and its eyes large, with silvery irises, and sometimes a slight tinge of red amongst the white. The mouth is small, the fore-teeth broad, and the hinder ones are rather tubercles than teeth; the coverings of the gills are fleshy. It has one back-fin, the anterior rays or nerves of which are prickly, the other soft and smooth to the touch. *Rondelet. de Pisc. lib. v. cap. 13. p. 144.*

ERYTHROCTANEUS, in *Ornithology*, the red and blue macaw, with a wedge-like tail, and the sides of the head naked and rough. See *MACAW*.

ERYTHRODANUM, in the *Matris Medice*, a name by which some authors have called the *rubia tinctorum*, or *MAJORE*.

ERYTHROIDES, in *Anatomy*, the first of the proper membranes that enclose the vessels.

It is interspersed with fleshy fibres, derived to it from the cruminate muscle, which makes it appear reddish. And hence its name from *erythros*, red, and *oides*, form.

ERYTHRONIUM, in *Botany*. See *DOCK*, *Yacht*.

ERYTHROTHALMIUS. See *RED EYE*.

ERYTHROXYLON, in *Botany*, a genus of the *diandria trigyna* class; the calyx is tubulose, the corolla has a caly, nectariferous, emarginated base, to which the stamina are joined; the fruit is a single-celled drop. *Linnaeus* enumerates two species.

ERY, or *ERZ*, in the botanical writings of the *Ancients*, a word used originally by the Hebrews, and by them made the name of the *CEDAR*.

ESAPHE, from *esapeo*, *I feel with the fingers*, a word used by Hippocrates, to express the touching of the mouth of the uterus, in order to discover its state or disease.

ESCALADE, or *ESCALADE*, a furious attack of a wall or a rampart; carried on with *LADDERY*, to pass the ditch, or mount the rampart; without proceeding in form, breaking ground, or carrying on regular works to secure the men.

When the troops are prepared to pass the ditch, either with the assistance of boards, hurdles, and fascines, when it is muddy, or with small boats of tin, or baskets covered with rim, or oil-cloth, when it is deep, and filled with water, a party must be placed on the counter-scarp, opposite to the landing-place, ready to fire at the garrison, if they are alarmed, and oppose the mounting on the rampart. If the ditch is dry, the ladders are fixed in some place farthest distant from the enemy, and as soon as they get upon the rampart, they put themselves in order to receive the enemy, if the enemy should be surprised, and stealthily overcome, the detachment hastens to break open the gate, and to let in the rest of the party.

Vol. II. No. 118.

If the ditch is wet, the rampart high, and provided with a revetement, it will be difficult to surmount the town in this way; but if there is no revetement, the troops may hide themselves along the outside of the rampart, till all are over. Since the invention and use of gun-powder, and the walls of cities have been flanked, they are seldom taken by *escalade*.

ESCALLION, in *Botany*. See *SCALLION*.

ESCAMBO, from the Spanish *cambar*, *to change*, was anciently a licence granted any one for the making a remittance, or giving a bill of exchange, to another beyond sea.

For, by stat. 5 Rich. II. no person might exchange, or return money beyond sea, without the king's licence.

ESCAPE, in *Law*, an evasion out of some lawful restraint, either by violence or stealth.

Escapes are either *voluntary* or *negligent*.

Voluntary, as when one arrests another for felony, or other crime, and afterwards lets him go, in which *escape*, the party that permits it, is, by law, to suffer punishment as if guilty of the fault committed by the person who *escapes*, be it felony, treason, or trespass; after the original delinquent is actually found guilty or convicted.

Negligent escape is, when one is arrested, and afterwards *escapes* against his will that arrested him; and is not punished by fresh suit, and taken again, before the party pursuing hath lost sight of him.

Keepers of prisons committing an *escape* shall forfeit 100*l.* and in civil cases, the sheriff is answerable for the debt.

ESCAPE WARRANT, in *Law*. If any person committed or charged in custody in the king's bench or Fleet prison in execution, or on meise process, &c. go at large, on oath thereof before a judge of the court where the action was brought, an *escape warrant* shall be granted, directed to all sheriffs, &c. throughout England, to retake the prisoner, and commit him to goal when taken, there to remain until the debt is satisfied; and a person may be taken on a Sunday upon an *escape warrant*. Stat. 1 Anne, cap. 6.

ESCAPEMENT, in *Horology*. See *PALETT*, and *TIME-KEEPER*.

ESCARTELE, in *Heraldry*, quartered, or *QUARTERLY*.

See *QUARTERING*.

ESCH, in *Ichthyology*, a name given by Hildegard and others, to the fish we call the grayling, or omber, and the generality of authors, the thymallus. It is of the corogoneus kind, and is distinguished by Ardeci by the upper jaw being longer, and the back fin containing twenty-three bones. The Germans call it *sch*, and the Italians *temio*.

ESCHALIOT, *Cepa Aestivum*, in *Botany*, a species of onion, cultivated in gardens for its use in cookery, and nearly resembling the *Welsh ONION*.

ESCHAR, in *Surgery*, a hard crust, or scab, formed on the flesh, by means of a hot iron, or a caustic medicine, or some sharp corrosive humour within.

The word *εσχα* signifies *crust*, or *scab*; which some authors derive from *εσ* and *ααα*, *I burn*; but this comes with some difficulty, because *ααα* is written with a *ν*, and *εσχα* with a *ς*.

The caustic fumes, or *lapia infernalis*, produces a round *eschar* in the place where it has burnt. See *ESCHAROTICS*, *CAUSTICS*, and *CAUTERY*.

ESCHARA, in *Natural History*, the name of a species of coralline, &c. the characters of which are these: they are of a fleshy, or coral-like hardness, and resemble a woven cloth in their texture; and the microscope shews us that they consist of arrangements of very small cells, whose surfaces appear much in that form. *Linnaeus* makes it a species of *millipora*, in the class of *Idiophytes*. See *Tab. II. Corallinae*, fig. 6. and 10.

ESCHAROPEPA, a word used by the old writers in *Medicine*, to express a coarse kind of barley-meal, which had been torried over the fire.

ESCHAROTICS, from *εσχα*, *eschar*, medicines, which, being applied externally, produce *eschars*, or scabs, by burning the flesh. See *ESCHAR*.

Such are the *lapia infernalis*, red precipitate, &c. These are also called *caustics*.

A composition of sulphur, resin, and honey, proves an *eschara*, with little or no pain.

ESCHATON, in *Music*, the difference between the diesis enharmonica and the hypocoche, that is, what remains, after taking the difference between the semi-tone minor and diesis enharmonica, from the latter. *Hendling*, in *Misc. Berlin*. vol. i. p. 279, 280.

Thus the difference between the semi-tone minor and the enharmonic diesis is $\frac{25}{128} = \frac{3125}{262144}$, and this taken

from the diesis, $\frac{128}{262144} = \frac{101216}{262144}$. This interval is about $\frac{23}{100}$ of a comma, as will easily appear by logarithms.

ritims. Mr. Henfling has taken notice of this interval. He calls it *schieten*, from its being the least and the last interval that occurs in his system.

The word is Greek, *σχισμα*. See INTERVAL.

ESCHEAT, from the French *eschéer*, to happen, in Law, signifies lands, or other profits, falling to a lord within his manor, either by way of forfeiture, or the death of his tenant dying without heir general or special, or leaving his heir within age, and unmarried.

The civilians call such *schietati*, or forfeitures, *hereditas*; and in the same sense, as we say the fee is *escheted*, they say *schietati* *aperitur*.

The word *escheta* sometimes also signifies a lawful inheritance descending on the heir. But then it is usually distinguished by the addition of *reita*, as *reita scheta*.

ESCHEAT is also used for the place or circuit within which the king, or other lord, hath *eschets* of his tenants.

ESCHEAT is also sometimes used for a writ, lying where the tenant having estate of fee-simple, in any lands or tenements holden of a superior lord, dies seized without heir, general or special: in which case the lord brings this writ against him that possesses the lands, after the death of his tenant; and thereby recovers the same in lieu of his services.

ESCHEATOR, an officer, who anciently took care of the king's *eschets* in the county, and certified them into the exchequer, or chancery.

He was appointed by the lord treasurer; held his office only for one year; nor could any person be *eschator* above once in three years. But this office, having its chief dependence on the court of wards, is now out of date.

ESCHEL, in *Mineralogy*, a term used by the smelt-workers, to express a sort of grey substance resembling ashes, which is usually mixed with the smelt when in fusion. This is carefully separated from it, before it is powdered for use, otherwise it would deface the colour. Phil. Trans. N^o 196.

ESCHEQUER. See ESCHIEQUER.

ESCHEVIN, or *Eschevin*, *Schöffin*, in the French and Dutch *Polity*, a magistrate elected by the inhabitants of a city, to take care of their common concerns, the good order, convenience, and decoration of the city, &c.

At Paris, there is a *prevot*, and four *eschervins*; in most other cities, a *maire*, or *mayor*, and *eschervins*. In Languedoc, Provence, and Dauphiné, they are called *consuls*; at Toulouse, *capituls*; and *forats* at Bourdeaux. Anciently, the *eschervins* were the assessors, and counsellors of the comites, or judges of cities; on which account they were called, in some places, *pairs*, *paris*; they even took cognizance of petty causes themselves.

Du-Cange observes, that the judges, and their assessors, who were chosen by the inhabitants, were called *schabini*, *schervins*, and their college, *schabingium*, or *schervinage*. He adds, that some authors call them *jurati*, because their office and jurisdiction extended to the securing peace in their city and banlieue, called *par villa*.

In Holland, the *schabini*, or *schervins*, judge of all civil affairs at first hand. They also take cognizance of criminal matters; and if the criminal confess himself guilty, they can see their sentence executed without appeal. They can even give torture. The number is not the same in all cities; at Amsterdam there are nine, at Rotterdam seven, &c.

ESCHRAKITES, or *ESRAKITES*, a sect of philosophers, among the Mahometans, who adhere to the doctrines and opinions of Plato.

The word is derived from the Arabic *عشركا*, *schrakata*, which in the fourth conjugation *عشركا*, *schrakata*, signifies to shine, glitter like the sun; so that *Eschrakite* seems to import shinning.

The *Eschrakites*, or Mahometan Platonists, place their highest good and happiness in the contemplation of the Divine Majesty; despising the gross imaginations of the Alcoran touching paradise. See MAHOMETANISM.

They are very careful in avoiding all vice; they preserve an equal and easy temper, love music, and divert themselves with composing little poems, or spiritual songs. The deists, or priests, and the chief among the preachers of the imperial mosques, are *Eschrakites*.

ESCHYNOMENOUS *Plant.* See ECHYNOMENOUS.

ESCLAIRCISSEMENT, a French term, which we find retained in some late English writers: it properly signifies the act, or effect, of clearing a thing, or rendering it more bright and transparent; being formed from the verb *esclairer*, to clear, &c.

It is chiefly used in a figurative sense, for an explanation of an obscurity or difficulty. The *esclairissement* of difficult passages in the Bible, is to be sought for from similar passages, or passages of the like kind occurring in other places.

ESCLAME, in the *Manners*, an obsolete French word, formerly used to signify a light-bellied horse.

ESCLATIE, in *Heralry*, is applied to a thing violently

broken. Thus a bend, or rather partition, *esclati*, is represented turn, or broken off, like a shield shattered with the stroke of a battle-ax.

ESCORT, a French term, sometimes used in English authors to denote a convoy, or company of armed men, attending some person or thing, in a journey or voyage, to defend or secure it from insult.

Some derive the word from the Latin *colorati*. See COLOUR.

ESCOUADE, or *ESQUAD*, is usually the third or fourth part of a company of foot; is divided for mounting guards, and for the more convenient relieving of one another. It is equivalent to a brigade of a troop of horse. See BRIGADE.

ESCROL, or *SCROLL*, in *Heralry*, a long slip, as it were, of parchment, or paper, wherein a motto is placed.

Leigh observes, that no person, under the degree of a knight, might, long after king Henry V. place his crest on a wreath, as is now usually done, but only on an *escrol*.

ESCROW, a deed delivered to a third person, to be the deed of the party making it, upon a future condition, when such thing is performed; and then it is to be delivered to the party to whom made. It is to be delivered to a stranger, mentioning the condition; and has relation to the full delivery. a Roll. Abr. 25, 26. a Inst. 31. See DEED.

ESCU, or *ECU*, the French crown, of sixty sols, or three livres. The *écu* was thus called, because the *escutcheon*, or arms of France, which they call *écu*, was struck thereon. See COIN.

Emaux de l'Escu. See EMAUX.

ESCUAGE, or *SCUTAGE*, an ancient kind of knight's service, called also *service of the shield*: the tenant holding by which, was obliged to follow his lord to the Scottish or Welch wars, at his own expence. But personal attendance being inconvenient, the tenants compounded for it by a pecuniary satisfaction, which was levied by assessments at a certain rate for every knight's fee; and thus it became a pecuniary lien of a military service. The first instance that occurs was in 5 Hen. II. on account of his expedition to Toulouse; it afterwards became more general and oppressive; so that king John was obliged to consent, by his Magna Charta, that no *scutage* should be imposed without consent of parliament; but the clause was omitted in the charter of Hen. III. which directly, that it should be taken as it used to be in the time of Henry II. or in a reasonable and moderate manner. However, it was afterwards enacted by stat. 25 Edw. I. cap. 5 and 6. and many subsequent statutes, that the king should take no aids or taxes, but by the common assent of the realm; and it appears that *scutages* were the ground-work of all succeeding subsidies, and of the land-tax of later times. Blackst. Com. vol. ii. p. 74.

ESCUAGE was also a reasonable aid, demanded by the lord of his tenants, who held of him by knight's service. See AID.

Concessit dominus regi ad nuntiantium filium suum de amibui qui tenet de domino regi in capta de jugla scuta 20 solidos scutagio. Matt. Paris. anno 1242.

ESCUAPIUS, in *Mythology*, the god of medicine. He was the son of Apollo, by the nymph Coronis, born at Epidaurus, where he had a famous temple, in which his images, made of gold and ivory, was placed on a throne of the same materials; it was covered with ivory, had a knotty stick in one hand, and the other arm is wound upon a serpent, and a dog lay at his feet. The Epidaurians instituted solemn games, which were celebrated in honour of him once every five years. This god was brought to Rome, by order of Apollo, when a pestilence raged in that city, in the times of the republic, and was honoured as one of the chief of their made-gods. He is said to have stolen away from his old worshippers under the shape of a serpent. He is represented with a mild look, and with hair and beard not unlike those of the mild Jupiter; his right arm is bare, in order to denote his readiness for any operations; his left holds a stick, with a serpent twisted round it. The dog and cock have been reputed sacred to this deity, on account of their vigilance, and the raven for his forecast. Statius, lib. iii. Sylv. 4. ver. 25. Ovid. Met. xv. ver. 662.

ESCULENTS, from *esculentus*, *edible*, a term usually applied to vegetables which are fit for food, as artichokes, carrots, turneps, parsneps, cabbages, cauliflowers, &c.

ESCULUS, in *Botany*, a name given, by many authors, to the phagus, or sweet oak, called also the *esculent oak*.

ESCVLS, or *ESCVLS*. See HERF CHESTNUT.

ESCURIAL, by the Spaniards written *ESCORIAL*, a term that occurs pretty frequently in our gazettes, and newspapers, for a place of residence of the kings of Spain. *Escorial* originally denotes a little village in Spain, situate in the kingdom of Toledo, seven leagues to the west of Madrid,

Madrid, and time to the east of Avila, on the side of a chain of mountains, called by some the Carpatian, or Carpatian mountains, and by others the Pyrenean, as being the branch of the Pyrenean ridge. Here king Philip II. built a barely monastery of the order of St. Jerom, held by the Spaniards for one of the wonders of the world, and called the *Escorial*. It was begun in 1557, and finished in about twenty-two years.

Fr. Francisco de los Padros, in a description thereof, entitled, *Descripcion breve del Monasterio de S. Lorenzo de real del Escorial*, &c. assures us it was built by that prince in memory of the battle of St. Quintin, gained on the day of St. Laurence, Lorenzo, a famous Spanish saint, and at his intercession; accordingly the plan of the work resembles a gridiron, the instrument of the saint's martyrdom.

The king and queen have their apartments there; the rest being possessed by the monks. Whence many of the great transactions of that court are dated from the *Escorial*.

The *Escorial* has a very fine church, to which Philip IV. built a beautiful chapel, called the Pantheon, or Rotonda, wherein the kings and queens of Spain, who leave any posterity, are interred; the rest being laid in another vault of the same church, together with the infants, and other princes.

It has eleven thousand windows, fourteen thousand doors, one thousand eight hundred pillars, seven hundred cloisters or piazzas, and twenty-two courts; with every convenience and ornament that can render a place agreeable in so hot a climate; such as an extensive park, groves, fountains, cascades, grottoes, &c. This palace contains three libraries, in which are eighteen thousand volumes, and three thousand Arabian manuscripts. Part of this superb palace was burnt in 1671.

ESCUTCHEON, or **SEUTCHEON**, in *Heraldry*, the field, or coat, wherein the bearing, or arms, of any person, are represented.

The word *escutcheon* is formed of the French *escusson*, and that from the Latin *scutum*, shield; which was the place arms were originally born on, before ever they came on banners; and still, wherever they are placed, it is on something representing the form of a shield. The Latin *scutum*, no doubt, came originally from the Greek, *σκιον*, *skion*, wherewith the shields were usually covered. See **SHIELD**.

The *escutcheon* is of a fisure figure, excepting the bottom part, which is usually a little rounded, ending in a point in the middle. See *Tab. Herald.* fig. 38.

Till within a few hundred years, the *escutcheons* of the French and English were triangular; those of the Spaniards are still quite round at bottom, without any point; those of the Italians are oval; and those of the Germans in form of *escutcheons*.

The ancient *escutcheons* were generally couched, or inclined; and they only began to place them upright, when crowns, &c. were put over them by way of crest.

In France, *escusson*, *escutcheon*, was formerly restrained to a shield, or coat, pointed at bottom; by which it was distinguished from the *écu*, which was quite square, and was only allowed to be borne by the counts and viscounts. Those of the inferior quality were confined to the *escusson* or pointed *écu*.

The several parts or points of the *escutcheon* have their proper names: the point A, for instance, is the *dexter chief point*; B the *middle chief*; and C the *sinister chief point*; D is the *base point*; E the *fesse point*; F the *narrow point*; G the *dexter base*; H the *middle*; and I the *sinister base point*.

The *dexter side* of the *escutcheon* answers to the left hand, and the *sinister side* to the right hand of the person that looks on it.

The *escutcheon* is differently denominated, according to its divisions. It is called *dexterist*, when the perpendicular line that divides it, is to the right of a third part of the *escutcheon*; *sinistrist*, when on the left; *divided in pale*, when this line is double, and divides the whole *escutcheon* into three equal parts; *pale*, when increased to the number of six, eight, or ten. A horizontal line makes the *chief*, when at one third part from the top; the *base*, when at a third from the bottom; and when double, in the middle, at an equal distance from both extremes, it makes the *fesse*, and the *divided in fesse*; when it is multiplied, it denominates it *fesse*; when there are eight or ten equal spaces, *barre*. A diagonal from the dexter point of the chief to the sinister of the base, makes it *traverse*; the contrary, *dunk*; if it be doubled at equal distances, the first makes *band*, and the *viere in band*; and the other *barre*, or *viere in bar*; increasing the number of the first makes *band*, and *estrie*; and increasing that of the second *barre*, and *traverse*.

ESCUTCHEON of pretence, is an *escutcheon*, or little *escutcheon*, which a man, who has married an heiress, and

has issue by her, may bear over his own coat of arms; and in it the arms of his wife, and, in this case, the surviving issue will bear both coats quarterly. See *Tab. II. Herald.* fig. 64.

ESCUTCHEON, in *Sea-law*, a name sometimes given to the compartment for the names or arms of the owner, or of the person whose title the vessel assumes. It is usually fixed on the middle of the ship's stern; and is more peculiar to the French, and other foreigners, than to English-built vessels. Falconer.

ESCUTCHEON-graving, in *Gardening*. See **ENGRAVING**.

ESDRAS. See **ESRA**.

ESEBON, a name given, by some of the chemical writers, to common sea-salt.

ESNECY, *Æsnece*, *Æsnece pisciculi*, in *Law*, a private prerogative, allowed to the eldest *esquire*, where an estate is descended to daughters for want of heirs male, to chuse first after the inheritance is divided. *Plac. lib. v. cap. 10. Jus primogenituræ*, in which sense it may be extended to the eldest son, and his issue, holding feils. In the statute of Marriages, cap. 9. it is called *marito part hereditatis*.

ESOTERIC, in *astronomy*. See **EXOTERIC**.

ESOX, in *Ichthyology*, the name of a genus of fishes, of the class of abdominalis, in the Linnæan system; are characters of which are these: they are of the *malacocephalus*, or soft-headed kind. The head oblong, membrane contains from seven to twelve bony scales. The body is oblong; the back-fin not large, and is placed very near the tail. The pectoral fins of this genus, enumerated by *Aristotle*, are three, and by *Linnaeus* nine.

The word *esox* is truly Roman. Pliny, and other of the ancient Latin authors, have used it as the name of the same fish. It seems to have been derived from the verb *esse*, to eat; for all the species of this fish are very voracious.

ESPALIER, in the *French Gardening*, a wall-tree; or a fruit-tree, which is not left to grow at liberty in full air, but has its branches nailed, or fastened, to a wall, or some other flat surface, near which it is planted; and, thus growing, it is made to conform itself to the flat, though unnatural, figure thereof. See **FRUIT-TREE**, **WALL**, &c.

ESPALIERS, in our *Gardening*, are rows of trees, planted regularly round the outside of a garden, or plantation, for the general security thereof from the violence and injury of the winds; or else only round some part of a garden, for the particular security of a plantation of orange-trees, lemon-trees, myrtles, or other tender plants; or, lastly, for the bounding of borders, walks, avenues, &c. *Espaliers* are now come into great use, with respect to the first of these intentions; in effect, it is found by experience, that the best brick, or stone walls, are not of themselves sufficient security to fruit-trees, from the ravages of blighting winds.

The reason may be, that, being built close and compact, they repel the winds, and, by that means, damage the tender plants, that lie within the reach of the repulsion; but these *espaliers* serve to weaken the violence of the winds, so that the tender greens, or plants, encompassed by them, rest serene and quiet.

Thus, if the *espaliers*, for instance, be of force, fir, holly, or yew, they give way to the force of tempestuous winds beating against them, without occasioning any relaxation thereof. Mess. London and Wife direct them to be planted at some distance, without the outmost bounds or walls of gardens, &c. Two or three rows of trees they think sufficient, from eighteen or twenty to twenty-five feet apart; and as to the method, or order, of disposing the trees, the most commodious is, where the middle row makes every where equilateral triangles with the extreme rows, in the following manner. See **QUINCUNX**.

The trees recommended for making, or planting, these *espaliers* fences, are the elm, lime, beech, Scotch fir, oak, pine, and yew; but, particularly, the two first. *Espaliers* are most commonly made of fruit-trees trained up to a lattice of wood-work, formed either out of stilpiles, or square pieces of fir-wood; and their most usual office is the sheltering, and at the same time hiding the quarters of kitchen gardens.

The trees principally planted for *espaliers*, now, are apples and pears, and some plums. The apples intended for *espaliers* should be grafted on crab-stocks, for large gardens, and for smaller on codling-stocks. The trees for the same hedge in an *espalier*, should be all such as are of the same age, from the grafting, and produced from the same stocks, that to the hedge may be the more regular. The more quick growing and spreading ones, must be planted at thirty or thirty-five feet asunder, and those of smaller

smaller growth, at twenty-five feet; the walk between them in a large garden should be sixteen feet wide; and if the *espaliers* are introduced to be carried up high, it should be more, that both hedges may have the benefit of the sun.

The best sorts of apples for *espaliers*, are the golden pippin, the nonpareil, the rennet gill, the atomatic pippin, the Holland pippin, the French pippin, Wheeler's ruffet, and Pile's ruffet, for the choice and pruning of these trees, see *APPLES* and *PRUNING*.

The pears, fitted for *espaliers*, are the summer and autumn kind; for the winter ones seldom succeed well. These trees, if designed for a strong moist soil, should be on quince stocks; but if for a dry soil, upon tree stocks. The distance for pears grafted on free stocks should be thirty feet, for moderately growing trees, and for the most vigorous growers, it ought to be, at least, forty feet. And the best kinds of pears for this purpose, are the jargonelle, the blanchette, the poire sans pique, the summer boncretine, Hamden's burgham, the poire du prince, autumn burgham, l'ambrette, gros rouffet, chamoiselle, beure de roy, the le marquis, and the cressane.

The third year after the trees are planted, the framework of the *espalier* should be made. Till this time the young shoots need only be trained to upright stakes, as nearly as can be in an horizontal direction. The best way of making the wood-work is of all-poles, which are not only cheap, but strong and durable. These are of two kinds; the largest poles, designed for upright stakes, should be cut about seven feet and a half long, and placed at a foot distance, in a right line, and about six feet above the ground, at the same height, a row of straight slender poles should be nailed along the tops of the upright stakes, in order to keep them even, and the stakes should be crossed with the smaller poles, at about nine inches distance, row from row, from the top to the bottom, and these rows of poles should be well fastened to the stakes with wire. Then the branches of the fruit-trees are all to be trained horizontally to these, and none should be suffered to cross one another, nor come too near, and fastened to them with small iron twigs, or rope-yarn. In the trees which produce large fruit, no branches ought to be nearer to each other than six or eight inches; in the smaller fruited ones, four or five inches will be sufficient; the advantages of the trees planted in *espaliers*, above those propagated as dwarfs, in the room of which these have been introduced, are many and very great. They take up very little room in a garden, and are of no injury to the plants cultivated in the quarters; and the fruit is always more regularly ripened and better tasted, as the sun and air can have every way free access to it. Miller.

To prevent the disorders that may befall *espalier* fruit-trees, when in blossom, Mr. Bradley mentions a nurseryman, who, having most sorts of fruit in *espaliers*, had portable hedges made of reeds in frames, which he set both at the back and front of his *espaliers*, as he saw occasion.

ESPAULE, EPAULEMENT, &c. in Fortification. See *ESPAULE*, *EPAULEMENT*, &c.

ESPHILASIS, from *esphilaui*, to recede inward, a term used by the old writers in Medicine, for the receding inward of the skull in depressions from contusions.

ESPLANADE, in Fortification, called also *GLACIS*; a part which serves the countercarp, or covert way, for a parapet; being a declivity, or slope of earth, commencing from the top of the countercarp, and losing itself, insensibly, in the level of the champaign.

ESPLANADE also signifies the ground which has been levelled from the glacis of the countercarp, to the first boulevard, or the vacant space between the works and the houses of the town.

The term is also applied, in the general, to any piece of ground which is rendered flat, or level, and which before had some eminence that incommoded the place.

ESPLEES, *Esplecia*, from *espleo*, in Low, the products which ground or land, &c. yield; as the hay of the meadows, the herbage of the pasture, corn of the arable, rents, services, &c. and an advowson, the taking of tithes in gross by the parson; of wood, the felling of wood; of an orchard, the fruit growing there; of a mill, the taking of toll, &c. These and such like issues are termed *esplees*. And it is observed, that in a writ of right of land, advowson, &c. the demandant ought to allege in his count, that he or his ancestors took the *esplees* of the thing in demand; otherwise the pleading will not be good.

Sometimes this word hath been applied to the farm, or land, &c. themselves.—*Dominus R. habet omnia esplecia et proficua de curia interposita.* Plac. Parl. 30 Edw. I.

ESPOUSALS, *Esponsio*, in Law, a contract or mutual

promise between a man and a woman to marry each other. Marriage or matrimony is said to be an *esponsal de sacramenti*.

ESQUADRILLE. See *QUADRILLE*.

ESQUADRON. See *SQUADRON*.

ESQUAVINE, in the *Almanac*, an old French word signifying a long and severe chastisement of a horse in training him.

ESQUINANCY, in Medicine, a disease called also *angina squamacea*, and, popularly, *QUINCY*.

ESQUIRE, a title of distinction, next below that of knight, and above that of a simple gentleman.

The origin, both of the name, and the things *esquires* is very obscure. The English denomination is evidently borrowed from the French, *esquire*, and that from the Latin *futur*, *futur*, as some will have it; or, as others, from *futur*, or *futur*, *fulgur*, *fulgur*, or from *fulgur*, *fulgur*, or from *fulgur*, *fulgur*. So many different opinions of the formation of the word, have given rise to a many about the primitive office of *esquire*; unless, perhaps, the latter hath given occasion to the former. Paquier, in his *Recherches*, liv. ii. chap. 15, maintains the title of *esquire*, *esquire*, *futur*, to be very ancient. From the time of the declension of the Roman empire, he observes, there were two extraordinary kinds of soldiery in the Roman army: the one called *gentiles*, and the other *futur*.

Amman, Marcellin. lib. xiv. cap. 7. and lib. xvi. cap. 4. speaks of these *futur* as men of redoubted prowess, and even deemed invincible: it is added, that Julian the Apostate set a mighty value on those troops, when he was among the Gauls; and hence, probably, it was, that the Gauls, or, perhaps, only the Franks, finding the bravest among the Roman forces were called *gentiles*, and *futur*, gave the like names to the boldest and bravest among themselves; such, according to that curious antiquary, is the original of *esquire*.

Esquire, however, afterwards came to be used in a somewhat different sense; viz. for a gentleman who attended a knight in the wars, and on other military occasions; bearing his shield, *futur*, before him (whence he was called *futur*, *fulgur*, or *fulgur*), as also his lance, and other weapons; whence his other Latin appellation, usual among us, *armiger*, q. d. *armis-bearing*. And hence, likewise, it is, that, in all our ancient romances, the hero is constantly attended by a gentle and trusty *esquire*. After all, the most probable derivation of *esquire* is not from *futur*, *futur*, as is the common opinion; but from *equus*, *horse*, the primitive *esquire* being no other than what the Latins call *equifrons*, who had the care and attendance of the equestrian, or horses, only.

Be this as it will, the title *esquire*, *armiger*, as now established among us, is next below that of knight, *esquire*. They who bear this title are all younger sons of noblemen, and the eldest sons of such younger sons, the eldest sons of knights, and their eldest sons successively; both which species of *esquires* by Henry Spelman entitled *armigeri* notwithstanding the four *esquires* of the king's body, and *esquires* created by the king, by putting about their necks a collar of SS's, and bestowing on them a pair of silver spurs, letters patent, or other investiture, and their eldest sons. Lastly, others, who, in the highest public offices, are reputed *esquires*, or equal to *esquires*, as sheriffs of counties, justices at law, justices of peace, mayors of towns, councillors at law, lieutenants of shires, majors, captains, &c. during the time of their commission. Lastly, the heads of some ancient families are likewise *esquires* by prescription. To these we have added the *esquires* of knights of the Bath, each of whom constitutes three at his installation; and all foreign, nay Irish peers; for not only these, but the eldest sons of peers of Great Britain, though frequently titular lords, are only *esquires* by the law, and must be so named in all legal proceedings. See *GENTLEMAN*.

ESQUISSE, in the French Painting, a term signifying the first slight sketch or draught of a picture; the first thought of a design drawn hastily with a crayon, or in colours, on paper, canvas, or the like, in order to be finished, and painted, or engraven afterwards. He had not the trouble of making a finished and correct design, but went to work upon the *esquisse*.

The word is formed of the Italian *schizzo*, a *sketch*, because an *esquisse* of a painting only represents, as it were, *spatters*, or *dots*, of colours.

ESRARTES. See *ESCHARTES*.

ESSAENS. See *ESSENT*.

ESSART, or ESART. See *ESART*.

ES-CHARGE derives the word from some of the barbarous Latin words, *exartus*, *exartus*, *exartus*, *exartus*, *exartus*, *exartus*, which all signify a forced cut down, or dug up; though Spelman chooses to deduce it from the Latin *exartus*, turn up, or unrooted. Others from *exartus*, to

and Serrarius comments at least a dozen different etymologies. Philo in Tract. Omnia proba Libet. Oper. p. 678. Colon. Allabar. 1612. Epiphani. Hæret. xiv. lib. i. Salmat. Plin. exercit. in Solin. cap. 35. Serrat. Tribunes. Jud. lib. iii. cap. 1. p. 106. 110. 111. 112. England. 1703. The principal ancient writers, who give any considerable account of the *Essenes*, are Josephus, Philo, and Pliny. Jos. de Bell. Jud. lib. ii. cap. 1. cap. 8. & 12. & Antiq. lib. xiii. cap. 9. lib. xvii. cap. 1. & cap. 2. & alibi. Philo, ubi supra, & De Vita contemplativa, p. 682. ed. Col. Allobar.

As to the origin of this sect, Pliny asserts, without mentioning his authority, that it had subsisted for several thousand years. The most probable opinion is, that this sect was formed by Jewish exiles, a little before the time of the Maccabees, who were forced to fly from the persecution of their enemies into caves and desert. The first *Esseni* we read of are mentioned in the fourth book of Maccabees, under the name of Hasmæni, and by Josephus both, which accounts agree, that they were already settled in Judæa, in the time of Jonathan, the brother and successor of Judas Maccabæus, about a hundred and fifty years before Christ. Philo and Josephus agree, that their number in Judæa was about four thousand, but Philo makes the number in Egypt much greater. Some have expected their surprise, that no mention should be made of this fact in the New Testament. This proceeded, as some imagine, from their retired mode of living, by reason of which they never came under our Saviour's observation, as the Pharisees and Sadducees often did. Others suppose, that, being very honest and sincere, without guile or hypocrisy, they gave no reason for that reproof and censure, which the others very fully merited. Præf. Com. vol. iii. p. 384. However, it has been supposed, that they are referred to by the apostle Paul in his Epistle to the Colossians, ch. ii. 18. 23.

Josephus, making mention of the several sects among his countrymen, distinguishes three; viz. the Pharisees, Sadducees, and *Esseni*; which last he prefers to the two former, as to their manner of life. He assures us, farther, that they were Jews, by original; from which it should appear, that St. Epiphanius was mistaken in ranking them among the Samaritans.

In effect, the *Esseni* appear to have been true Pythagorean philosophers, in every thing that related to their manner of living; for they greatly affected solitude and retirement, and avoided all conversation with women, to devote themselves more entirely to the contemplative life. Grotius will have the *Esseni* the same with the ancient *Σιδωνι*, *Ηιδωνι*, or *Ηιδωνι*; thus called, according to Philo, from their singular piety, humility, and devotion. Among these, Gale observes, it was, that the Hebrew philosophy chiefly flourished. Porphyry is very profuse in his praises of the *Esseni*: *Εσεντι τινες η Εσεντι Ιουδαιοι* *μω τω σωφροσυνω*, &c. He represents them as despisers of pleasures, riches, glory, and delicacy; and strenuously retainers to continency, austerity, duty, &c. He adds, they decline marriages, and adopt and educate other people's children in the principles of religion and philosophy; they are all on a level, hold every thing in common, neither buy nor sell, &c. By long habits, they arrived at such a degree of patience, that Porphyry affures us, flames and tortures had not the least effect on them. They scorned to treat their tormentors; nor ever shed a tear; but would smile under all their agonies, &c. As to their teaching, Philo Judeus, in his treatise, That every good Man is free, tells us, that they despised logic, as useless to the acquiring of virtue; physics they left to the sophists and disputants, as judging it to transcend the human faculties; and applied themselves wholly to morality. Porph. de Abstin. lib. iv. §. 11. seq. Gale Philof. Gener. lib. i. cap. 1. §. 11.

Both Josephus and Philo give a surprising account of their austere way of life, which the curious reader may see at large in Pridæaux's Conn. ubi supra. Their houses were mean; their cloaths made of wool, without any dye; they never changed their cloaths or shoes, till they were quite worn out; their food was plain and coarse, and their drink water; they neglected all bodily ornaments, and would by no means anoint themselves with oil, according to the fashion of those times. They lived in solitude, and had all their goods in common; their morals were very exact and pure, and they kept the Sabbath more strictly than any of the Jews. Before any of them were admitted to the common table, they bound themselves by a solemn oath to observe the rules of the society, which were very strict and exemplary.

Some have said that the *Esseni*, as well as the Pythagoreans, prohibited oaths; that they used only inanimate sacrifices, and that they not only worshipped towards the rising sun, but worshipped the sun itself. But it has

been urged, that neither of these charges seem to be well founded; or at least, that it is difficult to reconcile them with their known veneration for the writings of Moses, and other instances of their conduct. Pliny, and others on his authority, have asserted, that they wholly declined marriage; and Pliny (lib. v. cap. 12.) with near ten thousand souls, says, that for several thousands of years, this people is perpetually propagated without any help born among them, so fruitful and prolific was their; the repentance of others. But Josephus informs us (de Bell. Jud. lib. ii. cap. 1.) that there was one first of the sect, who agreed with the others, except in the article of marriage. For they reckoned, that those that do not marry cut off a great part from the number of the living, and that thus the whole race of mankind would soon be extinguished. Accordingly they made choice of those women, who, after three years trial, were found fit to bear children, and never cohabited with them after they were known to be with child; consulting the propagation of their species, and not their own gratification in this business.

With respect to the religious opinions of the *Esseni*, they believed the existence of angels, the immortality of the soul, and a future state of rewards and punishments, but denied the resurrection of the body. They maintained, that fate governs all things, and that nothing happens to man but by its appointment.

The *Esseni* seem to have been, among the Jews, what the most retired and austere monks are, or were, among the Christians; which was what gave them their denomination of *Ιουδαιοι ανητατοι*, Jewish ascetics.

Many catholic writers have even deduced the origin of monks from them; building, principally, on what Philo relates of them, who divides them into two branches, or sects; the one who married, and the other who lived in celibacy.

Josephus seems likewise to have had an eye to these two sorts of *Esseni*. Serrarius, who has wrote very amply on the subject, follows Philo, in making two classes of *Esseni*. The first are those whom he calls *Πιστικοι*, and who lived in community; the second, those called *Θεραπευται*, who lived in solitude, and led a life of pure contemplation. He adds, that Josephus only makes mention of the first; omitting the contemplative kind, whom Philo calls *Θεραπευται*, and who were principally found in Egypt. See THERAPEUTÆ.

Eusebius holds, that the *Esseni*, called *Θεραπευται*, were real Christians, or Jews converted by St. Mark, who had embraced this kind of life. Scalliger, on the contrary, maintains, that these *Θεραπευται* were no Christians, but real *Esseni*, who made profession of Judaism; however, he allows of the two kinds of *Esseni* above mentioned. But Valesius, in his notes on Eusebius, absolutely rejects any such distinction; he denies, that the *Θεραπευται* were any real *Esseni*; and that chiefly on the authority of Philo himself, who never calls them *Esseni*, and who places the *Esseni* in Judæa and Palestine, whereas the *Θεραπευται* were spread throughout Greece, Egypt, and other countries.

Some traces of the *Esseni* are found under the emperor Trajan, and under Justinian; but they were much exterminated from their primitive purity both of doctrine and manners; and the last about that time became extinct. Though the *Θεραπευται*, as well as the *Esseni*, were strictly Jews, and not Christians, it is not impossible, that some of them, becoming Christians, might first feel their former recluse way of living; and being imitated by others, lay the foundation of monkery among Christians.

ESSENTIA *salutis*, in *Chymistry*, a name given by Kunkel, and some others of the German authors, to a menstruum of which they relate wonderful effects; but the preparation of which seems hitherto a secret. They say this menstruum has nothing acid or corrosive in it, but that it approaches to the nature of spirit of wine, yet that it is capable of dissolving the most dense metals, and of converting any of them into a pure white salt, which has all their virtues, but nothing of that vitriolic acrimony, which they have when prepared in the common way. The salts of mercury and of gold thus prepared, have great praises bestowed on them, and are said to cure epilepsies, the venereal disease, and many other distempers, without any violence or danger. Kunkel, De Salu. Merat. See METAL.

ESSENTIAL, something that is necessary to constitute a thing, or that has such a connexion with the nature and reason of a thing, that it is found, or supposed, wherever the thing itself is.

Thus, it is essential to God to be just. Mr. Locke has laboured to overturn that great principle of the Christians, that thinking is *essentia* to the soul.

The heart, brain, and spinal marrow, are parts ordinarily

ly supposed essential to life, or without which life cannot be; yet we have instances, in history, of children being found, and alive, without almost any of those parts. See BRAIN &c.

ESSENTIAL *airs* are such as are really contained in a plant, and are drawn from it, by distillation, in an alembic, with water: they are thus called, in contradistinction to empyreumatic oils, which are raised by a naked fire, without water. See OIL.

ESSENTIAL *properties*, are such as necessarily depend on, and are connected with, the nature and essence of any thing, so as to be inseparable from it, in distinction from accidents.

ESSENTIAL *salts*, are those prepared from decoctions, or those which are found crystallized in the juices or infusions of plants: in contradistinction to those made by ministration. See SALT.

ESSENTIAL *Fevers*, *Furn*, *Mela*, *Part*, *Perfection*. See the substitutes.

ESSERE, *SORA*, and *SARE*, in *Medicine*, are little pustules or wheals, somewhat red and hard, which quickly infect the whole body with a violent itching, as if one were stung with bees, wasps, flies, or nettles; and therefore called the nettle-rash; yet they vanish after a little time, and leave the skin smooth and well-coloured as before. It differs from an *erysipela* in this, that an *erysipela* breaks out matter, but an *esse* does not.

ESSES, in *Artillery Language*, are fixed to aught chains, made in the form of an D; one end of which is fastened to the chain, and the other to hook to the horse's harness, or to a staple; they serve likewise to lengthen and piece chains together.

ESLISSORS, in *Law*, persons appointed by a court of law, to whom a writ of *empowerment* is directed, to impanel a jury, on challenge to the sheriff and coroners. They are to return the writ in their own names, with a panel of the jurors names. 15 Edw. IV. 24. pl. 4.

ESSEIGN, or *ESIGN*, in *Law*, an excuse for him who, being summoned to appear and answer to an action real, or to perform suit to a court baron, &c. cannot attend, because of some legitimate hindrance.

The word is formed of the French *essigne*, or *essaine*; and that from the barbarous Latin *essina*, or *essina*, which signifies the same.

The causes that serve to *essain*, are diverse; yet they may be reduced to five heads. The first is, *essain de ultra mare*, when the party is beyond sea; the second, *de Terra Sancta*, when as an expedition to the Holy Land; the third, *de male veniendi*, when he is infirm of body, and cannot come; which is also called the common *essain*; the fourth, *essain de male liti*, when the defendant is sick at bed; the fifth, *de servitio regis*, when he is in the king's service. Horn mentions several other *essains* touching the service of the king celestial, &c.

ESSEIGN *day of term*, is the first day of that term, when the court sits to take *essains*, or excuses, for such as do not appear according to the summons of the writ. But the person summoned hath three days grace beyond the return of the writ, in which to make his appearance; and if he appears on the fourth day inclusive, the *quarta die post*, it is sufficient.

ESSEIGN *de male villa*, in *Law*, is when the defendant is in court the first day, but goes without pleading; and being afterwards tormented with sickness, &c. cannot attend, but sends two *essainers*, who openly protest in court that he is detained by sickness in such a village, that he cannot come *pro lacrimis & pro dolore*; and this will be admitted; for it lieth on the plaintiff to prove, whether the *essigne* is true or not.

ESSEIGNS, *clerk of the*. See CLERK.

ESSORANT, from the French *essorer*, *to air*, in order to dry, in *Heraldry*, a term used to express a bird standing on the ground with the wings expanded, as if it had been wet, and was drying itself.

ESTABLISHMENT *of dower*, in *Law*, is the assurance and settlement of *dower*, made to the wife by the husband, on marriage; and *assignment of dower*, signifies the setting it out by the heir afterwards, according to the *establishment*.

ESTACHE is used in our *Old Writers*, for a bridge or flank of stone and timber.

ESTANDARD. See STANDARD.

ESTATE, in *Law*, the title, or interest, a man hath in lands, or tenements.

Estates are acquired diverse ways, viz. by descent from a father to the son, &c. conveyance, or grant, from one man to another; by gift or purchase, deed, or will; and a *fee-simple* is the largest estate that can be in law. 1 lib. 541.

Estates are real, of lands, &c. or personal, of goods and chattels; otherwise distinguished into *freeholds*, that descend to the heir, and *chattels*, which go to the executors.

Estate likewise is either simple or conditional. See *Fee-simple*, and *Fee-tail*.

The word *estate* generally, in deeds and grants, comprehends the whole, in which the party hath an interest or property; and will pass the same. 3 Mod. 46. See *Fee*, and *Tail*.

ESTATE, *addition of*. See ADDITION.

ESTATE, *base*. See BASE.

ESTATE, *que*. See QUE *estate*.

ESTATE, or simply **STATE**, denotes also the empire, kingdom, or *souveraineté*, with, and *terre*. See the articles. *dom*, *provinces*, or extent of lands, under the government of any sovereign.

The *glories* of the grand seigneur, of the king of Spain, &c. are very extensive; those of the king of France are compact, and well peopled. Italy is contained out into a great number of petty *estates*. We say, ministers of *estate*, secretaries of *state*, &c.

ESTATE, or **STATES**, is also generally applied in the same sense with *class* or *order*; thus, the 1st part of his majesty's subjects, or such of the people as are not comprehended under the denomination of *clergy*, may be divided into three distinct *estates*, or *states*, the *civil*, the *military*, and the *military*.

ESTATE is more particularly applied to the several ranks, or classes, of a people assembled together, for concerting measures, reforming public abuses, or composing the disturbances of a state.

In England, the three *estates*, viz. king, lords, and commons, meet ordinarily in parliament. In France, the *estates* consist of the churchmen, the nobility, and the people, or third *estate*. Some will have these assemblies of *estates* to be a very ancient constitution: all we know is, that there were general assemblies held, among the Gauls, before Caesar's conquest; but then the people, or third *estate*, had no share in them. Under the first and second race of the French kings, there were also solemn convocations, called *parliaments*; but the great lords of the realm were the only persons that were called to them. See PARLIAMENT.

ESTATES *General*. } See STATES *General*, &c.

ESTERLING, or **EASTERLING**. See STERLING.

ESTETE, in *Heraldry*, is used by the French to signify a beast whose head has been, as it were, torn off by force; and, consequently, the neck left rough and ragged; in contradistinction to *deffist*, or *despite*, where the neck is left smooth; as if the head had been cut off.

ESTHER, a canonical book of the Old Testament; denominated from a celebrated Jewish captive of that name, in Persia, whose beauty preferred her to the bed of Ahasuerus (supposed by some to have been Darius Hystaspes, by others Xerxes, but probably Artaxerxes Longimanus, though Jacob. Capellus makes him to be Ochus, called in Persia *Abasaph*), and the throne of Persia; and who, in that quality, saved her countrymen, the Jews, from the death to which Ahasuerus had doomed them, by the counsels of his favourite Haman, the history of which transaction makes the subject of the book of *Esther*. The critics are divided about the author of this book: St. Epiphanius, St. Augustine, and Irenaeus, attribute it to Ezra; but Eschylus will have it to be of a later date. Some ascribe it to Joachim, high-priest of the Jews, and grandson of Josiah; others will have it composed by an assembly, or synagoga, of the Jews, to whom Mordecai wrote letters, informing them of what happened. Edith. ix. 20.

But the generality of interpreters, Hebrew, Greek, Latin, &c. ascribe the book to Mordecai himself; Elias Levita, in his *M. S. Haman*, part. 3. mentions this opinion as unquestionable.

It is chiefly founded on that passage, chap. ix. ver. 20. where it is said, that *Mordecai wrote these things, and sent letters unto all the Jews, that were in all the provinces*, &c. It is also supposed, that queen Esther herself might have some share therein; it being expressed, in the same chapter, ver. 20. that Esther and Mordecai wrote a second letter, by the king's authority, to ordain the solemnizing a yearly feast, called *purim*, that is, *day of lots*, in commemoration of the Jews being delivered from the lot, or sort, whereby they had been condemned.

Some will have this book to be only deuterocanonical, or apocryphal; others contend for its being canonical, as far as chap. x. ver. 3. inclusive; and all the rest deuterocanonical. Of this sentiment are, St. Jerome, Theodorus, Dionysius the Carthusian, Cajetan, and others. The council of Trent turned the scale for its being canonical throughout; so that the matter is determined for the Catholic countries.

But the protestants retain the old opinion, and only admit it as far as the third verse of the tenth chapter; the rest, to the end of the sixteenth chapter, is thrown among

among the apocryphal books. See *DEUTEROCANONICAL* and *APOCRYPHAL*.

ESTILIA, *Feasts*, in *Antiquity*, solemn sacrifices to Vesta, called in Greek *estia*, of which it was unlawful to carry any way, or communicate any part to any beside the worshippers. Potter, *Archæol. Græc. lib. ii. cap. 20. tom. i. p. 396*.

ESTIATORES, *Triarii*, among the Athenians, persons appointed by lot to provide an entertainment for the whole tribe. Besides those appointed by lot to this office, others voluntarily undertook it to ingratiate themselves. Potter, *Archæol. Græc. lib. i. cap. 15. tom. i. p. 85*.

ESTIMIONE, in *Natural History*, a name by which some call the *barrenness*.

ESTIVAL accident. See *OCCIDENT*.

ESTIVAL orient. See *ORIENT*.

ESTIVAL solstice. See *ORIENTAL* and *SOLSTICE*.

ESTOLE. A *Crozier Estole* is a star with only four long rays, in manner of a cross; and accordingly, broad in the centre, and terminating in sharp points.

ESTOPPEL, forced of the French *estoppel*, *appellus*, *estoppel*, to stop, or block up, in Law, an impediment, or bar, of action, arising from a man's own act, or deed; against which a man is forbidden, by law, to speak, though it be to say the truth. See *BAR*.

Godard defines an *estoppel* to be, any bar, or hindrance, to one to plead the truth; and extends it not only to the impediment given by his own act, but by another's also. There are three kinds of *estoppel*; viz. *by matter of record*, *by matter in writing*, and *by matter in law*.

ESTOVERS, in Law, is used, by Bracton, for that fullness which a man, committed for felony, is to have out of his lands, or goods, for himself and his family, during imprisonment.

In lat. 6 Edw. I. it is used for an allowance in meat, or cloaths. In some manors, the tenants have *common of estovers*; that is, necessary botes, or allowances, out of the lord's wood: in which last sense, *estovers* comprehends *haysheath*, *hay-tie*, and *plew-bote*; so that if a man have in his grant these general words, *de raimentibus et estoveribus suis*, &c. he may thereby claim all three.

Estovers is also used for *ALIMONY*, which, if the husband refuses to pay, there is, besides the ordinary process of excommunication, a writ at common law, *de estoveribus laudibus*, in order to recover it.

ESTRAC, in the *Manège*, signifies a horse that is light-bodied, link-bellied, thin-flanked, and narrow-chested. See *BELLY*.

ESTRADE, a French term, literally signifying a public road, or high-way. Hence the military phrase, *battre l'estrade*, to beat the *estrade*, that is, to scout scouts, or horsemen, to get intelligence, to learn the dispositions of the enemy, and inform the general of every thing likely to fall in the way. An army never marches, without sending *battours d'estrade* on every side.

The word is formed of the Italian *strada*, *street*, or *road*; which is derived from the Latin *strata*, a paved street. Some derive it from *estradu*, who were cavaliers anciently employed in beating the *estrade*.

ESTRALE is also used for a little elevation on the floor of a room, frequently encompassed with an alcove, or rail, for placing a bed in; and sometimes, as in Turkey, only covered with fine carpets, for receiving visitors of distinction.

ESTRANGEL, **ESTRANGELUS**, in the Syriac Grammar. *Estrangel character*, is a particular species, or form, of Syriac letters; serving as the masculine letters in that language.

Abraham Ercehlensis takes the *estrange* character for the true ancient Chaldean character; and it is certain, the Assyrians, who call themselves Chaldeans, still occasionally use the *estrange* character, if we may credit Hottinger, in his *Theat. Philol.* p. 236. Bishop Walton, in his *Prolegomena*, gives us an *estrange alphabet*.

ESTRAPADE, in the *Manège*, is the defence of a horse that will not obey, but to get rid of his rider, rises much before, and while his fore-hand is yet in the air, yanks furiously with his hind-legs, striking higher than his head was before; and during this countenance goes back rather than advances.

ESTRAY, or *STRAY*, signifies any tame beast, as sheep, oxen, swine, and horses, or swans, found within a lordship, and not owned by any man; in which case being eriot, according to law, in the church, and two market-towns adjoining, if it be not claimed by the owner, within a year and a day, it becomes the lord's of the soil where found. If the owner claims it within the year and day, he must pay the charges of finding, keeping, and proclaiming; and he may seize it, without telling the marks, or proving his property, which may be done at the trial, if consulted. If the beast stray

within the year to another lordship, the first lord cannot retake it. An *estray* must be fed and kept, unhurt, and without labour, till it is reclaimed, or the limited time expires.

ESTREAT, *Estreatum*, in Law, is used for the true copy, or duplicate, of some original writing, especially of indentments, or penalties, set down in the roll of a court, to be levied by the bailiff, or other officer, on every offender.

ESTREATS, *disd of the*. See *CLERK*.

ESTREPEMENT, in Law, an impoverishing, or taking of land barren, by continual plowing and sowing, without due manuring, rest, and other husbandry. The word is derived from the French *estrepier*, *to strip*, or the Latin *estripere*, *to strip*, *to cut up*.

ESTREPEMENT is also used for any waste, or spoil, made, by the tenant for life, upon lands, or woods, to the prejudice of him in reversion; as the cutting down of trees, or lopping them farther than the law allows, &c.

ESTREPEMENT is also a writ which lies in two cases: the one, when a man having an action depending, is a felonious writ of right, or the like, sues to inhibit the tenant from making waste during the suit.

The other is for the defendant, who is obliged to recover his estate of the land in question; and before execution, for fear of waste to be made till he can get possession, sues out this writ.

ESULA, in Botany, a name given by many authors to some of the small species of *FRUGES*.

ESULA, *vari.*, in Botany, a name given by John Bauhin, and several other authors, to a plant, called also by some *ayum*, but properly a species of dog's bane, and distinguished by Mr. Tournefort by the name of *ayum maritimum* *foliis fœtidis purpureis*, or the purple-flowered sea dog's bane of Venice, with willow-like leaves. See *DOG'S BANE*.

ESULA, *radix*, in the *Materia Medica*, the name of a root of a plant of the purple kind, sometimes used in medicine. The root consisting of a conical part, and an inner sticky one, the bark only is used; and each should be chosen as is new dried, and of a reddish colour without and within, and such as when held in the mouth affords a very disagreeable taste, with great acrimony. It is a very violent purge, and has been said to have performed cures in dropical cases, when more gentle medicines have proved ineffectual. It is a good method to macerate it a day or two in vinegar before it is used.

The plant which produces it, is the *esula arvensis* *officinarum* of Mr. Ray: it is cultivated by some curious people in their gardens.

ESURINE, *sals*, in some authors, denote those of a fretting, eating, or corroding nature; which chiefly abound in places near the sea-side, and where a great quantity of sea-coal is burnt; as appears, from the speedy rusting of iron in such places.

ESUS, in Mythology, a deity among the Gauls, to which they sacrificed after victory whatever came alive into their possession. They sometimes sprinkled the shores of this deity with the blood of their women and children.

ETAPE, in War, an allowance of provisions and forage, made to the soldiers, upon march through a kingdom, or province, or on front winter-quarters. Hence, he that contracts with the country, or territory, for furnishing the troops in their march is called *etapier*.

ETCH. See *ENGRAVE*.

ETCH, *crop*, among Farmers, the third crop of corn upon land newly broke up. *DIET. RUST.*

ETCHING, a method of engraving on copper; wherein the lines, or strokes, instead of being cut with a tool, or graver, are etched with aqua fortis.

Etching was invented about forty or fifty years after engraving on copper, properly so called, probably by Albert Durer and Lucas. It has several advantages peculiar to itself, and which renders it, on some accounts, preferable to engraving; as, that it is done with greater ease and expedition; that it requires fewer instruments; and even that it represents divers kinds of subjects better and more agreeable to nature, as landscapes, ruins, grounds, and all small, faint, loose, remote objects, buildings, &c. The instruments employed in *etching* are needles, stiles, oil-flowes, scrapers, and brush-pencils. The needles are of the common kind, mounted on sticks about six inches long; and the artist should be provided with several of various sizes and sharpness. The stile is a needle, the point of which is blunted and polished, that it may glide freely over the paper, without scratching or cutting it: this is used for calking and overtracing the design on the varnish. The oil-flowes are well known; with respect to which it may be remarked, that they should be so soft, as not to take too fast hold of the needles.

needles, but to give a keen, smooth edge. See SCRAFER. The brush pencil should be large and soft, of camel's hair, and is used for cleaning the surface of the varnish after the engraving, and for other purposes.

The method of *sticking* is thus: the plate, being well polished (see COPPER-PLATE) is put upon a chafing dish, and heated over the fire; or, if small, is held with a hand-vice, the polished side being upwards, and heated with the flame of paper burning under it; when hot, it is rubbed over with soft varnish (such as is described in the sequel of this article) wrapped up in taffety, which should be gently pulled from one side to the other in a right line, so as to form several rows, till the plate is every where moderately covered; it then with a cotton ball, tied up in taffety, let every part of the plate be beat gently, while the varnish is in a fluid state; and, in order to give it a fine grain, continue to beat it with the ball, after the plate is taken from the fire, till it attains a harder consistence in cooling; but the use of the ball should be discontinued before the varnish is quite cold, lest it should be made to rise from the plate.

When the plate is thus uniformly and thinly covered with the varnish, it must be blackened by a piece of Blau-bean, or of a large wax-candle, which affords a copious smoke; two, or even four such candles are used together for the sake of dispatch, that the varnish may not grow cold during the operation, which should be performed, if possible, at one heating of the plate, for repeated melting of the varnish does it much damage. Large plates may be suspended from the ceiling of a room by four cords and iron rings, with the varnished side downwards, for the greater convenience of being blackened. Care should be taken that the flambeau or candles be kept at a proper distance from the plate, that the wick may not touch the varnish. The varnish may be made white, if that colour is preferred to black, by grinding a white lead in water, and putting it into a glazed earthen dish, with a little good glue dissolved, and melting the whole together. This mixture is spread with a brush or pencil of hog's hair thinly and evenly on the varnish laid on the plate and smoothed. The colour is then left to dry, if it fixes with difficulty on the varnish, the composition should be mixed with a drop or two of ox-gall. On this ground, thus prepared, the back of the design or draught is laid. When this is done, the design remains to be called, or transferred upon the plate, which is more easily effected than in the common engraving; for the lack of the design having been before rubbed over with red chalk, or lake-white, or, when the varnish is whitened, with powdered black-lead, nothing remains but to trace over all the lines and strokes of the draught with a needle or points which, pressing the paper close down to the ground, occasions the wax thereon to lay hold of the chalk, and to bring off the marks of the several lines, so as at length to show a copy of the whole design in all its correctness. Instead of rubbing the back of the design with the red chalk or black lead, it may be proper in some cases to spread the one or the other upon a piece of very thin paper of the exact size of the drawing, which should be laid on the plate with the dashed side towards the varnish under the drawing. The draught being thus called, the artist proceeds to draw the several lines and contours with a point through the ground upon the copper. See CALLING. When a picture or drawing is designed to be engraved on the same face, and turned the same way on the plate, so that the print will be turned to the opposite or contrary side to that of the original, a thin piece of paper, varnished with the Venetian varnish, very dry and transparent, or thin fan-paper, oiled with linseed oil, and perfectly dry, must be fixed to it: on this paper the lines of the original, which will appear through it, must be marked with a common *etching* point on the varnished paper, and with a black-lead pencil on the oiled paper, and afterwards called upon the varnish, by reddening the back of this paper with red chalk, or by interposing another very thin paper, not oiled, but reddened, between the oiled paper and the varnished plate. To finish his work, the artist makes use of points of various sizes, and presses on them, sometimes more strongly, and sometimes more lightly, as the several parts of the figures, &c. require a greater or less strength or boldness; some of the points being as fine as needles for the tender fair strokes, and the remoter fainter objects; and others again as big as bodkins, sometimes made with oval points, for the deeper shadows and the figures in the front of the work. These oval pointed needles have been rejected by several artists in working on the soft varnish: they are useful only in engraving architecture: those who are accustomed to the use of them may make the finest and smallest as well as the largest strokes, and *etch* a whole plate without any other instrument, by fur-

rowing it more or less, according to the magnitude of the intended strokes. Some engravers use needles that do not cut at all, nor make any perceptible impression on the copper. Care should be taken to preserve the soft varnish on the plate, for which artists have various contrivances. The most easy way is to lay the plate on a table in form of a saddle, and to cover that part of the varnish which allows of being covered in the engraving with a soft napkin of super or damask, folded evenly in four doubles, or with a piece of sheep-skin stretched in it, having the soft side turned towards the varnish; or with a board called a bridge, suspended at the ends by two pieces of wood about one fourth of an inch thick, left so as to let the plate lie freely under it. After all, if the varnish should be injured, the injury may be repaired by taking turpentine varnish, and having tempered it with a little lamp-black, covering, by means of a small pencil, the scratches, flaws, or false strokes, with the mixture. The plates, thus repaired, may be equally well engraved upon with others, and therefore this modern invention is extremely useful. The same composition may also be applied to those flaws occasioned by the scaling of the varnish, which sometimes happens in the operation.

Things being thus prepared, a rim or border of wax, composed of four parts of common bees wax, and one part of Burgundy pitch melted together, is rolled round the circumference of the plate covered with the varnish, and aqua fortis poured on, which is kept by the said border from running off at the edges. The ground being impenetrable to that corrosive water, the plate is defended from it every where, but in the lines or hatches cut through it with the points, which lying open, the water passes through them to the copper and eats into it to the depth required; and when this is done, it is poured off. Of *etching* grounds there are two kinds, the one soft and the other hard: the latter was formerly much used, being better accommodated to the intention of imitating the engraving with the tool; but the former has now wholly superseded the use of the other, as it gives a power of execution incompatible with the greater inflexibility of the hard varnish that confines the lines and hatches to such a firmness and regularity as give a stiffness of manner, and coldness of effect to the work. There are various directions for preparing the soft varnish. Le Boulle recommends the following: take of virgin wax, very white and clean, and of grains of malice, very clear and pure, each one ounce, and of calcined asphaltum, half an ounce; grind the mastic and asphaltum separately, very small, and melt the wax over the fire in an earthen pot well glazed. When the wax is thoroughly melted, and very hot, sprinkle the mastic into it gradually that it may melt, and stir the mixture that the ingredients may incorporate. Then sprinkle the asphaltum into the mixture, stirring the whole composition over the fire till the asphaltum be entirely melted: take the pot from the fire, and let the mixture cool; and pour the varnish into clean water, and by working it with the hand, form it into a roll of about an inch in diameter, or into small balls, which may be wrapt up in taffety and kept for use. The quantity of wax should be increased in winter.

The following soft varnish is used by many of the engravers at Paris: take of virgin wax, and asphaltum of each one ounce; half an ounce of black pitch, and a quarter of an ounce of Burgundy pitch: the asphaltum must be pounded in a mortar, and the wax melted over a slow fire in a pot of glazed earthen ware, and the rest of the ingredients added by little and little, stirring the mixture till the whole be well melted and incorporated. Then throw the whole mass into a vessel of clean water, and proceed as before. The following preparation has been well approved: take of virgin wax two ounces, an half; of Burgundy pitch, three ounces; of resin, half an ounce; of asphaltum, two ounces; and of turpentine, one pennyworth: the process of making it is the same as the former.

Rembrandt prepared a white varnish to be laid over a thin coat of any of the other kinds in the following manner: take of virgin wax, one ounce; of mastic, half an ounce; of calcined asphaltum, or of amber, half an ounce: pound the mastic and asphaltum separately in a mortar, and having melted the wax in a new earthen pot well glazed, sprinkle them into it gradually, and stir the mixture, till the whole be incorporated. Pour the melted mass into clean water, and form it into a ball for use. When this varnish is used, the plate should not be too much heated; the first coat of varnish should be laid very thin; and instead of blackening the varnish with smoky, take a piece of lake white, and having ground it fine and tempered it with gun water, lay a thin coat of it with a pencil over the plate when it is quite cold. In this way Rembrandt varnished his plates.

4 X There

E T E

ETERNAL flower, *serantheum*, in Botany, a genus of the *Juglandaceae* polytoma *superflua* class. Its characters are: the flower is composed of hermaphrodite and male flowers, which have one common caly. emplacement. The hermaphrodite flowers which form the disk are funnel-shaped, and cut into five points: the female flowers, which form the border or rays, are tubulous, and cut into five less equal points: the hermaphrodite flowers have five short stamens, terminated by cylindrical summits, and a short germen tapering a slender style, crowned by a blunt stigma; the germen becomes an oblong seed crowned with hairs, which tips in the emplacement. There are six species.

We have several species of this plant coltivated in our gardens, and known in English by the name of *ever-blasting flowers*, a name common to all the species of this plant, and of the amarantoides.

These flowers are of so dry and durable a structure, that if gathered just when they are ripe, they will last many years in perfection, and appear as fresh as when growing: they are also capable of several tinges, and hence are often seen of fine blues and greens, colours not natural to them.

They are all propagated by sowing their seeds in August, in a warm border, observing to water and shade them till they come up, if the weather proves too dry. When the young plants are two inches high they should be removed

ETH

to another warm border under the shelter of a wall, and there planted at five inches distance from each other. They will here stand the winter very well, and in spring will be ready to grow up for flowering without any farther transplanting; they are only to be kept clear of weeds, and in June they will flower. The flowers should be gathered in July for drying, and some of the finest should be suffered to stand for seed; for the plants will as soon as they have perfected their seeds, and must be renewed by sowing every year.

TERNITY, duration which is conceived incommensurable with time, and exclusive of beginning, progress, ending, &c. See GOD.

Authors are much at a loss for a proper and just definition of *strenu*; that of Boethius, De Consol. Philos. lib. v. part 6. viz. *Interminatus una res simul et perfecta possessio*, i. e. a perfect possession of a whole undivided existence altogether, though retained by S. Thomas and others, is faulty in divers respects.

Cassiodorus, De Dile Natali, defines *eternity* by infinite duration, that is, duration which has always been, and always will be. Others more fully describe it by a duration that exists altogether without any flux or succession of parts prior or posterior to each other: wherefore the word *duration*, taken abstractedly, imports not more than the perseverance of a thing in its existence, the *et durare* being here opposed to the *et cessare*, in *eternitatem*.

But soften the word duration how you will, it is scarce conceivable but by conceiving a quantity thereof, not a quantity without conceiving a succession. Others, therefore, define eternity by a *perpetuum nunc*, a perpetual now, or a *nunc semper flans*, an ever-standing now; but neither are these unexceptionable, the words *perpetuum* and *semper flans* importing an obscure loss of duration. See DURATION.

TELEPHOS, in *Anthology*, a divinity among the Romans, who had neither temples nor altars. They represented it under the figure of a woman, who held the sun in one hand and the moon in the other: her symbols were a phoenix, globe, and elephant.

SEALE. E. *Arabia Descripta*.—The winds which blow at stated times of the year, from which part fever of the country they come. They are so called from the Greek word *πνοή*, being yearly or anniversary winds, such as our people call monsoons and trade-winds, which, in some parts of the world, continue constantly blowing for certain stated seasons of the year. Thus the north winds, which, during the December, constantly blow upon the coasts of Egypt, and hinder all ships from sailing out of Alexandria for that season, are called *pylos* in Cæsar's Commentaries. In other authors, the west and east-winds are called *pylos*, when they continue blowing for certain seasons of the year. Vide Salmat. Exercit. in Solim. p. 421.

Cellarius endeavours to prove that those winds are properly *aequales* which blow from that part of the horizon which is between the north and west about the time of the solstice. Geog. Antiq. lib. I. cap. 8. See MORISON and WIND.

ÆTHELING, of ÆTHELING. See **ATHELING**.

ETHER. See **ETHER**.

THERIAL *oil*. See *ETHERIAL oil*.
THERMIS *leaf*. *Thermopsis*.

THESIOS (*aph*), a name given by some authors to the chrysolite.

ETHICAL *good*, ETHICAL *possible*. See the respective articles.

THICS, *Ethica*, the doctrine of manners, or the science of moral philosophy. See **PHILOSOPHY** and **MORA-**

LITY.
The word is formed of *etiquette*, *mores*, *manners*, because the

Gale makes *ethics* only the first part or branch of moral philosophy, viz. that which regards private persons, or in a private capacity.

By manners or morals is here meant, a way or manner of living confirmed by custom or habit, or certain habitudes of doing, or actions which are often repeated, which, if they be according to right reason, the morals or manners are said to be good, otherwise, evil and vicious.

Hence the object of *ethics* is the exercise of right reason in all our affairs, actions, and relations; or it is man himself considered as dignified, and to be conducted according to reason; and the end of *ethics* is to make him good and happy: so that if a man conducted himself according to right reason in all the circumstances of his actions, affairs, and relations, he would arrive at the highest state of moral perfection and beatitude.

Whence *ethics* may be defined a right manner of thinking in order to attain to human felicity, or a science whereby man is directed to conduct his will, and the

actions thereof, so as to live well and happily. See *WILL*.

The principal, may, the only topics thereof, are happiness and manners, whence arise two parts or branches of *ethics*, the first on moral happiness, considered as the end; and the second on moral virtues or good manners, as the means to arrive at that end.

ETHIOPIOSCORPTA, formed of *ethio*, manners, and *scorptus*, offend, I offend, in *Antiquity*, the name of a sect. Damascenus, in his *Treatise* of Heretics, tells us, that the denomination of *Ethiopschorpta* was given to such as erred in matters of morality and things relating to practice that were to be done or to be avoided, &c. who blamed things laudable and good in themselves, or recommended or practised things evil. On this footing the *Ethiopschorpta*, though a numerous body, were no particular sect.

ETHIOPIE, *verbum*. See *DIALE*, *Ethiopi*.

ETHIOPIE, *year*. See *YEAR*.

ETHMOIDAL, **ETHMOIDALIS**, in *Anatomy*, a denomination given to one of the foramina of the human cranium.

The common features are those which separate the base of the cranium from those of the cheeks, and are lower the transverse, ethmoidal, sphenoidal, and zygomatical. See *OSTEA*.

The *ethmoidal* takes its denomination from its turning round the os ethmoidica.

ETHMOIDES, *Ethmoides*, in *Anatomy*, a bone situate in the middle of the basis of the forehead or os frontis, and at the top of the root of the nose, filling almost the whole cavity of the nostrils.

It has its name from *ethmo*, cranium, *sternum*, and *ethmo*, because all porous and porous.

By its ethmoid part, it is joined to the head; by the spongy part, to the cavity of the nostrils; and by the plain and broad part, to the orbits of the eyes.

In the ethmoid part is an apophysis, which jets out in a point into the cavity of the skull, called from its figure *crura galli*, or the *cock's comb*. From its under side there goes a thin bone, which divides the cavity of the nostrils into two, called the *concha*. It is perforated by a number of small holes, through which the fibres of the olfactory nerve pass.

J. Philip Ingrassia, a Sicilian, who was born in Sicily in 1510, and died in 1580, was the first who gave a just account of the structure of the *os ethmoidale*, or *ethmoidale*, in a work printed at Palermo in 1693. fol.

The figure of this bone is very singular, and may be said to be in some measure cubical. This bone may be divided into a middle and two lateral portions; in the middle three parts may be distinguished, an upper, a middle, and a lower. The upper part of the middle portion is a eminence, called *crura galli*, which is often fold, sometimes, however, it has been found hollow in several degrees, and perforated by a small opening which communicates with the frontal sinuses: a groove is sometimes also met with in its anterior edge, which leads to the spiral or blind hole in the os frontis. The middle part of this portion is a small horizontal plate perforated by several holes, and called *lamina cribrosa*; and in its back part it has a little notch for its articulation with the sphenoidal bone; this lamina may be called the body of the bone, as being what principally supports all the other parts of it.

The lower part is a perpendicular lamina, which makes part of the septum nostrium: the edge of this is rough and uneven, for its better connection with the vomer. The lateral portions of the *ethmoidal* bone are by far the most considerable, if we regard size only; each of these may be divided into two, one superior, which is the largest, and which may be called the labyrinth of the nostrils, it being full of turnings and windings, and irregularly cellular; and one inferior, in the shape of a shell. It is of a very tender and delicate structure, though compact, and without any diploe, being almost all composed of thin bony plates. It is joined to the os frontis, os sphenoidale, ossa nasi, ossa maxillaria, ossa ungula, ossa palati, and vomer; the uses of it are to be a very principal part of the organ of smell; and to give a very great extent to the privacy membrane in a small compass. Winslow's *Anatomy*, p. 29.

ETHNARCHA, *Ethnarchus*, formed of *ethno*, nation, and *archa*, command, a governor and ruler of a nation. There are some medals of Herod I. furnished the Great, on one side whereof is found *Herod*, and on the other *Barabbas*, q. d. *Herod the Ethnarch*. After the battle of Philippi, we read that Antony passing over into Syria, constituted Herod and Phasael his brother tetrarchs, and in that quality committed to them the administration of the affairs of Judea. Jos. Ant. lib. xiv. cap. 23. Herod therefore had the government of the province before ever

the Parthians entered Syria, or before Antigonus's invasion, which did not happen till six or seven years after Herod was commander in Galilee. Jos. Ant. lib. xiv. cap. 23. Consequently, Herod was then truly *ethnarch*, for he can be no otherwise denominated; for this *ethnarch* has been in that space of time that the medals were struck, which only give him this title, which medals are a confirmation of what we read in history of the government which that prince was intrusted with before he was raised to the royalty.

Josephus gives Herod the appellation of *tetrarch* in lieu of that of *ethnarch*; but the two terms come so near to each other, that it is easy to confound them together.

Though Herod the Great left by will to Archelaus all Judea, Samaria, and Idumea, yet Josephus tells us he was then only called *ethnarch*.

ETHNOPHONES, in *Antiquity*, a sect of heretics in the seventh century who made a profession of Christianity, but joined thereto all the ceremonies and follies of paganism, as judicial astrology, fortileges, auguries, and other divinations.

They derive their denomination from *ethno*, nation, and *phono*, thought, judgment, q. d. *paganism*, or persons whose thoughts or sentiments were still heathen or gentile.

They practised all the expiations of the gentiles, celebrated all their feasts, and observed all their days, months, times, and seasons. See Damascenus, *Heretic*, No. 95.

ETHOLOGUS, among the ancients, a mimic, or actor, who could represent all the various habits and dispositions of the mind.

ETHOPEIA, or **ETHOPEA**, in *Rhetoric*, called also **ETHOLOGICAL**, a draught or description, expressing the manners, passions, genius, temper, aims, &c. of another person.

The word is of Greek original, being formed of *etho*, mind, as *ethnologia*, and *peia*, *factum*, *figura*, *descriptio*. Quintilian, lib. ix. cap. 2. calls this figure *imitationem animi*, and in Greek, *imitationem*. In English we denominate it a *picture*, or *character*.

Such is that beautiful passage in *Salustius*, in his *Bellum Catilinarium*, wherein he gives us a picture of Catiline: "he had an uncommon strength both of body and mind, but an ill-turned and wicked disposition."

"When very young, his great pleasure was in intestine broils, rapine, slaughter, and civil discord. His body was formed to undergo fasting, cold, and watching, beyond all belief. His mind was daring, deceitful, and various, and could imitate or accommodate itself to every body; he was extremely covetous of other people's goods, and profuse of his own. His lusts and desires were very high; his stock of eloquence considerable; but he had little or no discretion."

The *ethopeia* is divided into *prophetica* and *ethopeia*, properly to call it the former of which is a picture of the body, countenance, make, dress, gait, &c. and the latter of the mind.

ETHULIA, in *Botany*, a genus of the *gynoeceia polyandra* aquatic class. The receptacle is naked, and the seed has no down. There are five species.

ETIOLETTE, a French term, primarily denoting a ticket or title affixed to a bag or bundle of papers, expressing its contents. It is also used when applied to the Spanish and some other courts, to signify a particular account of what is to be done daily in the king's household, and in the chief ceremonies relating to it. It likewise denotes those forms that regulate the decorum of conduct towards persons of various ranks and relations.

ETRUSCA terra, in the *Matrin Media*, a kind of hole of which there are two species, the white and the red; they are called by many authors the *terra sigillata* and *terra rubra magni fluvii*, as they are brought to us sealed with different impressions.

The *white Tuscan earth* is a dense and compact substance of a dull deadish white, which in drying acquires some degree of yellowness; it is of a smooth surface, and does not stain the fingers in handling. It is not easily broken, and but slightly adheres to the tongue, and freely melts into a substance like butter in the mouth. It makes a slight effervescence with acid menstrua.

The *red Tuscan earth* is a pure hole, very heavy, and of a compact texture, and of a dull brownish red colour. It is naturally of a smooth surface, breaks easily between the fingers, and does not stain the hands; it adheres strongly to the tongue, and melts freely in the mouth, and has a strong alstringent taste, and leaves no sandy harshness between the teeth. It makes an effervescence with acid menstrua. This is made up of small flat cakes, and impressed with a shield bearing a ducal coronet, &c. These are the characters by which both these earths may be known from others of the same colour: they are both dug in several parts of Italy, particularly

theory of *evaporation*, on of the ascent of water in such a fluid as air, between eight and nine hundred times lighter than itself, to different heights according to the different densities of the air; in which case it must be specifically lighter than the air through which it ascends. The Cartesian account for it by supposing, that by the action of the sun upon the water, small particles of the water are formed into hollow spheres and filled with the *materia lubrica*, which renders them specifically lighter than the ambient air, so that they are buoyed up by it.

Dr. Nicuwentijt, in his Religious Philosophy, cont. 13. and several others have alleged, that the sun emits particles of fire which adhere to those of water, and form *molecules*, or small bodies, lighter than an equal bulk of air, which consequently ascend till they come to an height, where the air is of the same specific gravity with themselves; and that these particles, being separated from the fire with which they were incorporated, coalesce and descend in dew or rain. Dr. Halley has advanced another hypothesis, which has been more generally received: he imagined, that by the action of the sun on the surface of the water, the aqueous particles are formed into hollow spheres filled with a finer air highly rarefied, so as to become specifically lighter than the external air. Phil. Trans. N° 192. or Abr. vol. ii. p. 136. Dr. Desaguliers, dissatisfied with these two hypotheses, proposes another in the Phil. Trans. N° 407. or Abr. vol. vii. p. 61. See also his Course of Experimental Philosophy, vol. ii. p. 376, &c. He supposes that heat acts more powerfully on water than on common air; that the same degree of heat which rarefies air two-thirds will rarefy water near 12,000 times; and that a very small degree of heat will raise a steam or vapour from water, even in winter, whilst it condenses the air; and thus the particles of water are converted into vapour by being made to repel each other strongly, and deriving electricity from the particles of air to which they are contiguous, are repelled by them and by each other, and form a fluid, which, being lighter than the air, rises in the air, according to their relative gravities. The particles of this vapour retain their repellent force for a considerable time, till, by some diminution of the density of the air in which they float, they are precipitated downwards and brought within the sphere of each other's attraction of cohesion, so that they join again into drops of water. Many objections have been urged against this opinion by Mr. Clarke, in his Treatise of the Motion of Fluids, p. 204, &c. and by Mr. Rowling in his System of Philosophy, part. II. dist. 6. to which Dr. Hamilton has added the two following, viz. that if heat were the only cause of *evaporation*, water in a warm close room would evaporate faster than when exposed in a colder place, where there is a constant current of air, which is contrary to experience; and that the *evaporation* of water is so far from depending on its being rarefied by heat, that it is carried on even whilst water is condensed by the coldness of the air, for water is gradually condensed by cold till it freezes; and since it evaporates even when frozen into hard ice, it must also evaporate in all the lesser degrees of cold. Heat, therefore, does not seem to be the principal, much less the only cause of *evaporation*.

Others have attempted to account for the phenomena of *evaporation* on another principle, viz. that of solution; and shewn, from a variety of experiments, that what we call *evaporation* is nothing more than a gradual solution of water in air, produced and supported by the same means, or by attraction, heat, and motion, by which other solutions are effected.

The Abbé Nollet seems to have been the first who started this opinion, without much pursuing it, in his Leçons de Physique Experimentale, the first edition of which was published in 1743: he offers it as his conjecture, that the air of the atmosphere serves as a solvent or sponge with regard to the bodies that encompass it, and receives into its pores the vapours and exhalations that are detached from the masses to which they belong in a fluid state; and he accounts for their ascent on the same principles with the ascent of liquors in capillary tubes: on his hypothesis, the condensation of the air contributes, like the squeezing of a sponge, to their descent. See the work above cited, fifth edit. 1767, tom. II. p. 109, and p. 426. See VAPOUR.

Dr. Franklin, in a Paper of Philosophical and Meteorological Observations, Conjectures, and Suppositions, delivered to the Royal Society about the year 1747, and read in 1756, suggested a similar hypothesis: he observes, that air and water mutually attract each other; and hence concludes that water will dissolve in air, as salt in water; every particle of air assuming one or more particles of water; and when too much is added it precipitates in

rain. But as there is not the same contiguity between the particles of air as of water, the solution of water in air is not carried on without a motion of the air, so as to cause a fresh accession of dry particles. A small degree of heat is sufficient to weaken the cohesion of the particles of water, that those on the surface easily quit it, and adhere to the particles of air; a greater degree of heat is necessary to break the cohesion between water and air. Air moderately heated will support a greater quantity of water invisibly than cold air; for its particles being by heat repelled to a greater distance from each other, thereby more easily keep the particles of water that are annexed to them from running into cohesions that would obstruct, retard, or reflect the light; and hence it happens, that when we breathe in warm air, though the same quantity of moisture may be taken up from the lungs as when we breathe in cold air, yet that moisture is not so visible. On these principles he accounts for the production and different appearances of fogs, mists, and clouds. He adds, that if the particles of water bring electrical fire when they attach themselves to air, the repulsion between the particles of water electrified, joins with the natural repulsion of the air to force its particles to a greater distance, so that the air being more dilated, rises and carries up with it the water; which mutual repulsion of the particles of air is increased by a mixture of common fire in the particles of water. When air, loaded with surrounding particles of water, is compressed by adverse winds, or by being driven against mountains, &c. or condensed, by taking away the fire that dilated it in expanding, the particles will approach one another, and the air with its water will descend as a dew; or if the water surrounding one particle of air comes in contact with the water surrounding another, they coalesce and form a drop, and we have rain; and since it is a well-known fact, that vapour is a good conductor of electricity as well as of common fire, it is reasonable to conclude with Mr. Heul, that *evaporation* is one great cause of the clouds becoming at times furbered with this fluid. Phil. Trans. vol. lxvii. part. I. p. 134. See Phil. Trans. vol. lv. art. 24. p. 182. or Franklin's Letters and Papers on Philosophical Subjects, p. 42, &c. and p. 182, &c. ed. 1769. M. le Roi, of the Academy of Sciences at Paris, hath also advanced the same opinion, and supported it by a variety of facts and observations in the Memoirs, &c. for the year 1751. He shews, that water does undergo in the air a real dissolution, forming with it a transparent mixture, and possessing the same properties with the solutions of most salts in water; and that the two principal causes which promote the solution of water in the air are heat and wind; that the hotter the air is within a certain limit, the more water it will dissolve; and that at a certain degree of heat the air will be saturated with water; and by determining at different times the degree of the air's saturation, he estimates the influence of these causes on which the quantity suspended in the air is a state of solution depends. Accordingly, the air, heated by evaporating substances to which it is contiguous, becomes more rare and light, rises, and gives way to a denser air; and, by being thus removed, contributes to accelerate the *evaporation*.

The non-elastic air contained in the internal parts of evaporating bodies, put into action by heat, serves also to increase their *evaporation*, as is evident in the case of the *Æolipila*. The wind is another cause of the increase of *evaporation*, principally by changing and renewing the air which immediately encompasses the evaporating substances; and from the consideration of these two causes combined, it appears why the quantity of vapour raised in the night is less than that of the day, since the air is then both less heated and less agitated. M. le Roi farther shews, that winds blowing in particular directions are more favourable to *evaporation* than others; thus the north and north-west winds accelerate *evaporation* in Languedoc, and probably in other parts of Europe, and the south-east wind retards it. To the objection urged against this hypothesis, on account of the *evaporation* of water in a vacuum, this ingenious writer replies, that the water itself contains a great quantity of air, which gradually disengages itself and causes the *evaporation*; and that it is impossible that a space containing water which evaporates should remain perfectly free from air. To this objection a late writer, Dr. Dobson of Liverpool, replies, that though air appears by unquestionable experiments to be a chemical solvent of water, and as such, is to be considered as one cause of its *evaporation*, heat is another cause, acting without the intervention of air, and producing a copious *evaporation* in an exhausted receiver; agreeably to an experiment of Dr. Irving, who says, that water in an exhausted receiver rises in vapour more copiously at 180° of Fahrenheit's thermometer than in the open air at 212° its boiling point.

point. Dr. Dobson farther adds, that water may exist in air in three different states; in a state of perfect solution, when the air will be clear, dry, and heavy, and its powers of solution still active; in a state of beginning precipitation, when it becomes moist and foggy, its powers of solution are diminished, and it becomes lighter in proportion as its water is deposited; and also when it is completely precipitated, which may happen either by a more slow process, when the dissolved water falls in a drizzling rain, or by a more sudden process, when it descends in brisk rain. Phil. Trans. vol. XLII. part i. p. 217. and Phipps's Voyage to the North Pole, p. 211. Dr. Hamilton, professor of philosophy in the university of Dublin, transmitted to the Royal Society in 1768, a long Dissertation on the Nature of *Evaporation*, in which he proposes and establishes this theory of solution; and though other writers had been prior in their conjectures, and even in their reasoning on this subject, Dr. Hamilton assures us, that he has not repeated any thing as new which he was conscious had ever been proposed by any one before him, even as a conjecture. Some of the facts alleged by professor Hamilton, and some of the conclusions deduced from them, are similar to those of M. le Roi; but the similarity appears to be merely accidental. The editor, having laid before the public a fair and impartial account of the history of the new theory, as it may be called, of *evaporation*, which is the most plausible, and now the most generally received, will terminate this article with a brief view of Dr. Hamilton's arguments in support of it, and the application of it to the phenomena of the atmosphere. By solution, Dr. Hamilton understands with other writers, such an intimate union between the particles of a body and those of a fluid, that the whole shall appear an homogeneous mass, as transparent as the fluid was before such union, and shall continue so, till some external cause produces a change: he considers the transparency of the fluid as the criterion of a true solution, and that which dissimulates it from a mixture. He proceeds to shew, that there is a mutual attraction between the water and air of the same kind with that which is observed between the particles of any two bodies, one of which dissolves the other. All water contains a considerable quantity of air which may be separated from it, and as it retains its elasticity, we may reasonably suppose, that it is prevented from escaping by the force of attraction, just as the particles of gold are suspended in aqua regia, by their attraction towards the particles of that fluid. Besides, water exhausted of its air will again imbibe a certain quantity, gradually drawing it into its pores till it is saturated, just as a lump of sugar draws water into its pores. Air, likewise, evidently contains a quantity of water, which will be drawn from it even in its purest and driest state by dry salt of tartar, so that the salt will become entirely fluid; and yet in this case the air is perfectly transparent. There is also a remarkable similarity between the properties of common solutions and those of *evaporation*. As salt beginning to dissolve in water appears at first to thicken the water that surrounds it, and the solution of it to be promoted by agitation, the air that lies at rest over water appears thick, and loaded with aqueous particles, in which case the *evaporation* proceeds very slowly, which is greatly promoted by a current of fresh air passing over the exhaling surface.

When a lump of any salt is dissolved in clear cold water, the water that is first saturated with it will rise on agitation in curled wreaths through the other water, tender it somewhat opaque, and give an apparent tremulous motion to an object seen through it, till by degrees the solution is complete, and the transparency of the water is restored; the case is the same when any two fluids of different densities that will incorporate, are mixed together; thus, smoke, or steam, when it first rises into the air, exhibits similar appearances; and the vapour rising in a hot day from moist ground will make the air and any object seen through it appear to have a tremulous motion, which is still more observable when a telescope is used, that magnifies the floating vapours. Farther, heat, by expanding bodies, enlarging the pores, and lessening the mutual cohesion of their particles, promotes, and cold, on the contrary, in some measure retards and checks both solution and *evaporation*. As very hot water dissolves salt sooner, and in a greater quantity than cold water, and when cooled, deposits part of the salt after a strong solution, which was before dissolved; so water will evaporate faster in warm than in cold air; and therefore, the air is generally clearer in cold than in hot weather. Thus the aqueous vapours suspended in the air during the heat of the day, fall down at night, and form themselves in a drop of dew, or if the night be very cold, appear next morning crystallized in a hoar-frost. If a bottle of very cold liquor be exposed to the warm air in a hot day, the air contiguous to it being

cooled, will let go part of its water, which will form a dew on the outer surface of the glass: by an experiment similar to this M. le Roi was first led to conclude that water is really dissolved in air: for the same reason a dew is formed on the inside of the windows of a warm room, which on their outside are exposed to the cold air. Again, the quantity of a body dissolved, and of a fluid evaporated, depends, *ceteris paribus*, on its quantity of surface.

Chemists produce cold by solution: thus, by dissolving powdered ice or snow in spirits of nitre, a degree of cold has been produced sufficient to freeze quicksilver. See FREEZING and THERMOMETER. Cold is also produced by *evaporation*: aether, or spirit of wine, of the same temperature with the air, rubbed lightly (with a feather) over the ball of a thermometer, will make the quicksilver sink as they evaporate; and the quicker they evaporate, the faster will the quicksilver sink: any volatile spirit rubbed over the hand feels much colder than water of the same temperature; and ether feels colder than spirit, on account of their more sudden *evaporation*.

M. Anouton, in a Memoir of the Academy of Paris, 1699, and M. Richman, in a memoir of the Academy of Petersburg, 1747, have observed, that cold is produced by evaporating fluids; this phenomenon has been noticed also by M. Mairan in 1689, and by Muschenbroek in his Essai de Physique; and Dr. Cullen has found, that the cold thus produced is nearly in the proportion of the volatility of the fluids, and that it is considerably greater in *vases* than in air. Ed. Phys. and Art. Edinb. vol. ii. p. 1756. See THERMOMETER. Professor Braun has made a farther investigation of this matter, by publishing a table of the degrees of cold produced during the *evaporation* of different fluids. Nov. Comm. Petrop. tom. x. 1764.

Dr. Franklin mentions a practice recorded in Benier's Travels through Indostan, written near a hundred years ago, to this purpose: in travelling over dry deserts in that climate, they carry water in flasks wrapped in wet woollen cloths, and hung on the shady side of the camel or carriage in the free air, whereby as the cloths gradually grow drier, the water contained in the flasks is made cool. Franklin's Letters, &c. p. 364.

Again, there is a stronger attraction or affinity between spirit of wine and air than between water and air; and, since the spirit evaporates much faster than the water, the *evaporation* of fluids seem to arise from an attractive force between their particles and those of air. Finally, after dissolving a body in any proper menstruum, if another be added that has a greater affinity to the menstruum than the first, this will be dissolved, and the first will be precipitated; and in the same manner, any fluid will let go the air which it contains on the addition of another body to which it has a greater affinity than it has to the air; from which fact it may be inferred, that the air, imbibed by any fluid, is properly speaking, dissolved in that fluid, and therefore, that any fluid which evaporates, or is imbibed by the air, is also, properly speaking, dissolved in air. Dr. Hamilton, having examined the agreement between solution and *evaporation*, concludes, that *evaporation* is nothing more than a gradual solution of water in air, produced and promoted by attraction, heat, and motion, just as other solutions are effected.

In order to account for the ascent of aqueous vapours into the atmosphere, this ingenious writer observes, that the lower part of the air being pressed by the weight of the upper against the surface of the water, and continually rubbing upon it by its motion, attracts and dissolves those particles with which it is in contact, and separates them from the rest of the water. And hence the cause of solution in this case is the stronger attraction of the particles of water towards the air than towards each other, those that are already dissolved and taken up will be still farther raised by the attraction of the dry air which lies over them, and thus will diffuse themselves, rising gradually higher and higher, and thereby leave the lowest air, not so much saturated but that it will still be able to dissolve and take up fresh particles of water; which process is greatly promoted by the motion of the wind. When the vapours are thus raised and carried by the winds into the higher and colder parts of the atmosphere, some of them will coalesce into small particles, which slightly attracting each other, and being intermixed with air will form CLOUDS; and these clouds will float at different heights, according to the quantity of vapour borne up, and the degree of heat in the upper parts of the atmosphere. Thus clouds are generally higher in summer than in winter. When the clouds are much increased by a continual addition of vapours, and their particles are driven close together by the force of the winds, they will run into drops heavy enough to fall down in RAIN. If the clouds are frozen before their particles are gathered into drops, small pieces of them being condensed and made heavier by the cold, fall down in thin flakes of snow. If the particles are formed into drops before they

they are frozen, they become HAIL-STONES. When the air is replete with vapours, and a cold breeze springs up which checks the solution of them, clouds are formed in the lower parts of the atmosphere, and compose a MIST or FOG, which usually happens in a cold morning, and is dispersed when the sun has warmed the air, and made it capable of dissolving these watery particles. Southerly winds generally bring rain, because being commonly warm and replete with aqueous vapours, they are cooled by passing into a colder climate; and therefore part with some of them, and suffer them to precipitate in rain: whereas northerly winds, being cold, and acquiring additional heat by coming into a warmer climate, are ready to dissolve more vapour than they before contained; and therefore, by long continuance, they are dry and parching, and usually attended with fair weather.

Changes of the air, with respect to its density and rarity, as well as its heat and cold, will produce contrary effects in the solution of water and the consequent ascent or fall of vapours. Several experiments prove, that air, when rarefied, cannot keep so much water dissolved as it does in a more condensed state; and therefore, when the atmosphere is saturated with water, and changes from a denser to a rarer state, the higher and colder parts of it will let go some of the water before dissolved, form new clouds, and dispose them to fall down in rain: but a change from a rarer to a denser state will stop the precipitation of the water, and enable the air to dissolve either in whole or in part, some of those clouds that were formed before, and render their particles less apt to run into drops and fall down in rain: on this account, we generally find, that the rarefied and condensed states of the atmosphere are respectively attended with rain or fair weather. See more on this subject in the Phil. Transf. vol. lxviii. art. 23. p. 149, &c. or Hamilton's Philosophical Essays, &c. 1756. p. 33, &c.

Dr. Halley furnishes us with some experiments of the quantity or measure of the evaporation of water. The result is contained in the following articles.

1. That water fished to about the same degree as fall-water, and exposed to a heat equal to that of a summer's day, did, from a circular surface of about eight inches diameter, evaporate at the rate of six ounces in 24 hours. Whence, by a calculus, he finds that the thickness of the pellicle or skin of water, evaporated in 2 hours, was the 53d part of an inch; but, for a round number, he supposes it only a 60th part; and argues thence, that if water as warm as the air in summer evaporates the thickness of one 60th part of an inch in 2 hours from its whole surface; in 12 hours it will evaporate the 10th of an inch: which quantity, he observes, will be found abundantly sufficient to furnish all the rains, springs, dews, &c.

In effect, on this principle, every 10 square inches of the surface of the water yield in vapour per diem a cubic inch of water; and each square foot half a wine pint; every space of 4 feet square, a gallon; a mile square, 6914 tons; and a square degree of 69 English miles will evaporate 33 millions of tons a day; and the whole Mediterranean, computed to contain 160 square degrees at least 5280 millions of tons. Phil. Transf. N° 129. or Abridg. vol. ii. p. 108, &c.

2. A surface of 8 square inches, evaporated purely by the natural warmth of the weather without either wind or sun, in the course of a whole year, 16192 grains of water, or 64 cubic inches; consequently the depth of water thus evaporated in one year amounts to 8 inches. But this being too little to answer the experiments of the French, who found that it rained 12 inches of water in one year at Paris; or those of Mr. Townley, who found the annual quantity of rain in Lancashire above 40 inches; he concludes, that the sun and wind contribute more to *evaporate* than any internal heat or agitation of the water.

It has since been discovered, that there was a source of error in Mr. Townley's experiments, with which the world was not at that time acquainted; his rain-gage was fixed 10 yards above the surface of the earth; but Dr. Heberden has found, that a rain-gage fixed below the top of a house received above a fifth part more rain than another of the same size above the top of the same house; and that there fell upon Westminster Abbey not much above one-half of that which fell in the same space below the tops of the houses; and by several experiments made by Dr. Dobson of Liverpool, it appears, that the quantity of rain received in a vessel placed on the ground exceeded that received by another of the same dimensions 18 yards higher more than one-third, and less than one-half. Phil. Transf. vol. lxx. art. 47. and vol. lxxii. art. 52. p. 256.

With regard to the cause of this difference, it may be observed, that as in chemical precipitations a greater por-

tion of the precipitating substance will be received on the real bottom of a vessel containing the solution than on a supposed false bottom placed any where above it, and that in proportion to its height above the real bottom; so a greater quantity of water, condensing rain as a precipitation of water before dissolved in air, ought, on starting with its former solvency, to fall on the surface of the earth, than on an imaginary horizontal plane of the same dimensions above it; and though the cases are not exactly parallel, yet the drops of rain in their descent must be somewhat increased either in number or size; partly by successively impinging on the aqueous particles contained in the air through which they pass, and by attracting others in virtue of their being possessed of a different electricity; and partly by the spontaneous separation and precipitation of that moisture, which is known to be contained in considerable quantities in the air at all times, and the appearance of which, dripping down the walls of our houses, &c. is one of the popular signs of approaching rain. Monthly Review, vol. xiv. p. 322. Dr. Dobson states the annual evaporation at Liverpool, taking the medium of 4 years at 36.28 inches. Dr. Halley fixes the annual evaporation of London at 48 inches. See Phil. Transf. vol. lxxii. part i. p. 252.

3. The effect of the wind is very considerable, on a double account; for the same observations shew a very odd quality in the vapours of water, viz. that of adhering and hanging to the surface that exhales them, which they clothe as it were with a fleece of vaporous air; which once investing the vapour, it thenceforward rises in much less quantity. Whence, the quantity of water lost in 24 hours, when the air was very still from wind, was very small, in proportion to what went away when there was a strong gale of wind abroad to dissipate the fleece, and make room for the emission of vapour; and this, even though the experiment was made in a place as close from the wind as could be contrived.

Asks, that this force of water hanging on the surface of waters in still weather in the occasion of very strange appearances, by the refraction of the vapor's, differing from and exceeding that of common air: whence every thing appears raised, as houses like steeples, ships as on land above the water, the land raised, and as it were lifted from the sea, &c.

4. The same experiments shew, that the evaporation in May, June, July, and August, which are nearly equal, are about three times as great as those in the months of November, December, January, and February. Phil. Transf. N° 122. or Abr. vol. ii. p. 116, &c. Dr. Brownrigg, in his Art of making Common Salt, p. 189, fixes the evaporation of some parts of England at 73.8 inches during the months of May, June, July, and August; and the evaporation of the whole year at more than 120 inches. The evaporation of the four summer months at Liverpool, on a medium of four years, was found to be only 18.88 inches. Dr. Hales calculates the greatest annual evaporation from the surface of the earth in England at 6.66 inches; and therefore the annual evaporation from a surface of water, is to the annual evaporation from the surface of the earth in Liverpool as 36 to 6, or as 6 to 1. Phil. Transf. vol. lxxii. ubi supra.

EVAPORATION, in Pharmacy, Chemistry, &c. denotes an operation by which the more aqueous and volatile parts of fluids are spent, or driven away in steam, so as to leave the remaining part stronger, or of a higher consistence than before.

Evaporatio is effected by setting a liquor over a gentle heat, to carry off the most fluid and volatile parts, without lessening the quantity of the other matters with which the liquor is impregnated.

The vessels used for this purpose are basins, telfs, or crucibles, which are made of glass, metal, or earth, according to the nature of the bodies on which the operation is to be performed. They are flat, shallow, and wide, so that the body from which the evaporation is to be made may present a large surface to the air. In all evaporation the degree of heat ought to be proportioned to the volatility of the substance to be evaporated, and to the degree of fixity of the substance intended to be left, and of its adhesion to the volatile parts. In some cases, as in obtaining oil from rectified spirit of wine and ether, the liquors ought to be evaporated upon the surface of water in open air, without any other heat than that of the atmosphere; in others, when the part to be evaporated is not very volatile, and when the remaining substance is very fixed, and does not adhere much to the volatile part, as in the purification of gold by antimony, a strong heat may be applied, and a current of air directed upon the surface of the body. Macquer.

EVASION, *evasio*, in Law, is used for any subtle endeavour to set aside truth, or to escape the punishment of the law, which will not be endured. Thus, if a person says to another that he will not strike him, but will give

give him a pot of ale to strike him first: and accordingly he strikes, the remaining of it is punishable; and if the person first striking be killed, it is murder; for no man shall evade the justice of the law by such a pretence to cover his malice. 1 Hawk. P. C. 87.

EUVATES, a branch or division of the ancient Celtic philosophy the *Druid* is.

Strabo distributes the philosophers among the Britons and Gauls into three sects; *taurici*, *Bardi*, *Verbori*, *Enates*, and *Druidi*. He adds, that the *Bardi* were poets and musicians; the *Enates*, priests and naturalists; and the *Druidi*, moralists as well as naturalists. But Marcellinus, Vossius, and Horneus, reduce them all to two sects, viz. *Bardi* and *Druidi*. Lastly, Caesar, lib. vi. comprehends them all under the name of *Druidi*.

The *Enates* or *Fati* of Strabo might probably be what other authors, and particularly Ammian. Marcellin. calls *Euhagari*; but Mr. Bouche, in his Hist. de Provence, lib. ii. chap. 2. distinguishes between them. The *Fati*, he says, were such as took care of the sacrifices and other ceremonies of religion; and the *Euhagari*, those who spent their time in the search and contemplation of the great mysteries of nature.

EUBAGES, an order of priests or philosophers among the ancient Celts or Gauls. Chorier takes the *Euhagari* to be the same with the *Druidi* and *Sarnadi* of Diodorus. Others will have the *Euhagari* to be those whom Strabo, lib. iv. p. 197. calls *Verbori*, *Enates*, or *Fati*, on which principle there is room to conjecture, that the word should be written *Euvages*, it being easy to mistake a *r* for a *t*.

Be this as it will, the *Euhagari* appear to have been a different order from the *Druidi*. See *Druid*.

EUCHARIST, *Eucharia*, the sacrament of the Supper, or a participation of the body and blood of Christ, under the species or figures of bread and wine. See *COMMUNION*, *SACRAMENT*, *SPECIES*, *TRANSUBSTANTIATION*, and *CONSUBSTANTIATION*.

The word in its original Greek, *Eucharista*, literally imports thanksgiving, being formed of *eue*, bene, well, and *tergo*, gratia, thank.

EUCHITES, or *Euchitæ*, a sect of ancient heretics, who were first formed into a religious body towards the end of the fourth century, though their doctrine and discipline subsisted in Syria, Egypt, and other eastern countries before the birth of Christ; they were thus called because they prayed without ceasing, imagining that prayer alone was sufficient to save them.

Their great foundation was those words of St. Paul, Epist. i. to the Thessalonians, chap. v. ver. 17. *pray without ceasing*.

The word is formed of the Greek *eucha*, prayer, whence *eucharia*, the same with the Latin, *precatæ*, prayer. They were also called *Euchitæ* and *Massiliani*, a term of Hebrew origin, denoting the same as *Euchites*.

The *Euchites* were a sort of mystics who imagined, according to the oriental notion; that two souls resided in man, the one good, and the other evil; and who were zealous in expelling the evil soul or demon, and hastening the return of the good spirit of God, by contemplation, prayer, and singing of hymns. They also embraced the opinions nearly resembling the Manichean doctrine, and which they derived from the tenets of the oriental philosophy. The same denomination was used in the twelfth century, to denote certain fanatics who imitated the Greek and Eastern heretics, and who were charged with believing a double Trinity, rejecting wedlock, abstaining from flesh, treating with contempt the sacraments of Baptism and the Lord's Supper, and the various branches of external worship, and placing the essence of religion solely in external prayer, and maintaining the efficacy of perpetual supplications to the Supreme Being for expelling an evil being or genius, which dwelt in the breast of every mortal. This sect is said to have been founded by a person called Lucipetrus, whose chief disciple was named Tycheus. By degrees it became a general and insatiable appetite for persons of eminent piety and zeal for genuine Christianity, who opposed the vicious practices and insidious tyranny of the priesthood; much in the same manner as the Latins comprehended all the adversaries of the Roman pontiff under the general terms of *WALDENSES* and *ALBIGENSES*. Moth. Eccl. Hist. Eng. lib. viii. fol. i. p. 320. and vol. ii. p. 441.

St Cyril of Alexandria, in one of his letters, takes occasion to censure several monks in Egypt, who, under pretence of religious themselves wholly to prayer, led a lazy, scandalous life. A censure likewise applicable to monasteries in general.

EUCHOLOGION, *Euchologia*, a Greek term, signifying literally, a discourse on prayer.

The word is formed of *eucha*, prayer, and *logos*, discourse.

The *Euchologion* is properly the Greek ritual, wherein are prescribed the order and manner of every thing relating to the order and administration of their ceremonies, sacraments, ordinations, &c.

Fa. Goar has given us an edition of the Greek *Euchologion* in Greek and Latin, with notes, at Paris.

EUCHYMIA, from *eue*, good, and *chyma*, juice, in *Medicina*, a good temper of the blood, or other juices and fluids in an animal body.

EUCLAURIS, in *Anatomy*, a table wherein the slaughtered victim was spread, in order to have its intestines carefully inspected. It was from this table that the vessels used in sacrifices were called *eucleuris*.

EUCRASIA, of *eue*, well, and *crasis*, temperate, an agreeable, well-proportioned mixture of qualities, whereby a body is said to be in good order, and disposed for a good state of health.

EUDIOMETER, in *Pneumatic*, is an instrument lately invented, in consequence of the experiments and discoveries of Dr. Priestley, for determining the salubriousness of different kinds of air. The name is formed of *eue*, good, and *metron*, denoting in composition a medium, and *metron*, I measure.

The reader will find under the article *AIR*, *nitrous*, an account of the principle on which the construction of these instruments depends. Dr. Priestley, having discovered that when nitrous air is mixed with any other air, their original bulk is diminished, and that the diminution is nearly, if not exactly, in proportion to its salubrity, was led to adopt nitrous air as a true test of the purity of respirable air; and nothing more seemed to be necessary than an easy, expeditious, and accurate method of estimating the degree of diminution in different cases; and for this purpose the *eudiometer* was contrived. The discovery of Dr. Priestley was announced to the public in the year 1784; and the able Fontana and the chevalier Landriani, both of Italy, were the first who availed themselves of this discovery in the construction of *eudiometers*.

One of these instruments, invented by Landriani, consists of a glass tube ground to a cylindrical vessel, with two glass cocks and a small basin, all fitted in a wooden frame. In this instrument quicksilver is used instead of water; and that part of it which replaces the bulk lost by the diminution of the two mixed airs, is conducted either through a kind of glass siphon, or through the capillary holes of a glass funnel; so that by its fall the whole mixture of the two kinds of air is more readily made. Dr. Falconer of Bath accurately divided a glass tube, in order to exhibit the quantity of diminution produced by the mixture of nitrous air with air of another kind, agreeably to the method used by Dr. Priestley in the pursuit of this curious discovery. See *ERZSUTIA*. Mr. J. H. de Magellan, F. R. S. has described three different *eudiometers* of his own contrivance. One of these consists of the following parts, viz. a glass tube *m n d*, (see *Tab. I. Pneumatic*, fig. 8.) about 12 or 15 inches long, and of an equal diameter, with a ground glass stopple *m*; a vessel *e*, the neck of which is ground air-tight to the lower end *d* of the tube; and two equal phials, *a* and *b*, whose necks are also ground air-tight to the respective mouths of the vessel *e*; both these vessels contain nearly as much as the whole tube *m n d*. There is also a sliding brass ring *s*, which slides in the tube *m*, and may be made tight at pleasure by a finger-screw; and lastly, a ruler *g*, either of brass or of wood, represented fig. 9. which is divided into equal parts, and indicates the contents of both the phials *a* and *b* when thrown into the tube, by the number of parts which is engraved or stamped about the middle of it. The two bent pieces of brass *s*, *t*, serve to hold it easily by the side of the tube *m d*, (fig. 10. and fig. 11.) keeping it close to the neck *m* by the notch *i*. In using this instrument, it will be convenient to have a tall glass receiver like that represented fig. 10. or a tube or trough fig. 11. made with straight boards of elm-wood one inch thick; the inside dimensions are 25 inches long, 13½ wide, and 11 deep: the two end boards, *e* and *f*, are fitted into a groove cut in the other three boards: it should be double with thick white paint as a cement, for retaining the water, and the whole fastened with nails from the outside. The chief *water* is 3 inches wide, and 2 inches thick, in which are 3 holes of 3 tenths of an inch diameter, with as many separate cavities underneath, so as to serve like so many funnels; or a glass funnel cemented to the middle hole *n* is equally convenient. This shell is supported by a metallic hook *h w n s*, which may be raised or lowered at pleasure by means of wooden wedges. A trough of this kind is the most commodious for experiments on different kinds of air. Let such a trough or tub be nearly filled with water, take out the stopple *m* of the *eudiometer* and fill it with water in the position exhibited fig. 8. or fig. 11. then close

close it with the stopple *m*, without leaving any air in the inside; and put the lower part *c* under the surface of the water in the tub, fig. 11. in the position there represented. Let the phial *a*, filled with water, be kept with its mouth downwards, under the surface of the water, and filled with that air, the fallibility of which it is required to ascertain. This is done either by putting the phial *a* on the shelf *n* of the tub, fig. 11. and throwing the air into the glass funnel *h*, which is there cemented to the shelf; or by holding in the left hand the same phial *a*, together with a glass funnel without a pipe applied to the mouth of the phial, whilst the air is poured with the right hand into it. But lest the heat of the hand should produce any considerable expansion in the air, the glass funnel may be held close to the mouth of the phial by wooden tongs with bent wires *s*, fig. 12. unless they are made with a solid lump at their bottoms as they are here represented. If a glass bottle with a ground glass stopple be filled with water or mercury, and emptied in the place whose atmospheric air is to be tried, it will be filled with that air; and being closed with the glass stopple, may be carried to any distant place, in order to determine its comparative fallibility. When the phial *a* is filled with air in the manner already described, it is put moderately tight into the mouth of the vessel *e*, and for greater security against accidents, the necks of the phials *a*, *b*, and of the vessel *e*, as well as the glass stopple *m*, are always rubbed with tallow previously to every experiment. Then take the phial *b* filled with water, and by the same process fill it with nitrous air, and replace this phial *b* in the other mouth of the vessel *e*. Let the *eudiometer* be carefully inverted, so that the two phials may be downwards as exhibited in fig. 10. by this operation the two kinds of air come up to *r* from the phials *a*, *b*, and thus are mixed together: when this is done, dip the *eudiometer* in the water of the trough, fig. 11. leaving the mouth of the instrument above its surface, so that no more water may enter into it than it had at first. Then attentively observe the moment when the mixture *rs* (fig. 10.) of the two kinds of air comes to its greatest diminution; after which, as Mr. Magellan has observed, its bulk will begin to increase again: for this purpose slide down the brass ring *z* of the instrument as the surface of the water in the tube falls; and when this becomes stationary, which it will do in a few minutes, if the nitrous air has a proper strength, we shall have the greatest diminution. Then fill up the whole tube of the *eudiometer* with water, that it up with the stopple *m*, and incline the top of the instrument forwards till the air comes from *x* up to the top of the tube; keep the lower part of the instrument dipped in the water; take off the glass vessel *e* with the two phials *a*, *b*, and raise or lower the tube of the *eudiometer* so as to see the surface of the water in the inside even with that on the outside, which mark by sliding to it the brass ring *z*. Or apply the ruler (fig. 9.) to the side of the *eudiometer* whilst it is immersed in the water of the trough, and thus you will see the true dimension of the remaining bulk of the two kinds of air already diminished. The number marked about the middle of this ruler, e.g. 66 = 96, denotes that the contents of both phials *a* and *b* are equal to 96 divisions of the ruler when put into the tube of that *eudiometer*; or they are equal to a solid cylinder, as thick as the inside of the glass tube, and whose length is 96 divisions of the ruler divided into tenths of an inch. When e.g. the remaining bulk of mixed air corresponds to the 56th division of the ruler, it flows that out of 96 parts only 40 (= 96 - 56) have been lost or consumed; and in this case the wholefulness of that air called *A* will be $\frac{40}{96}$. If another equal quantity of different air called *B*, be tried by the same *eudiometer*, and its residuum be equal to 56 parts of the same ruler, the relative fallibility of the air *B* will be to that of *A*, as 36 (= 96 - 60) to 40. But if the air *B* had been tried by another *eudiometer*, whose proportional dimension marked about the middle of its water, were 66 = 108, then the comparative fallibility of these two kinds of air *A* and *B* would be in the compound ratio of $\frac{36}{108} \times \frac{40}{96} = \frac{36 \times 40}{108 \times 96} = \frac{1440}{10368} = \frac{1}{7.2}$ to the wholefulness of the air *B* would be to that of *A* as 34 to 624. If the operator be provided with a tall glass receiver, as fig. 10. he need only dip the *eudiometer* inverted into the water contained in the vessel *P*, fig. 14. put the two kinds of air into the phials *a* and *b* in the manner already directed; turn the instrument upright as in fig. 10. and finish the process in the method just described: but he should take care that every part of the process be conducted in the fine temperature, since air is apt to expand or contract by heat and cold; and therefore, he should keep a good

thermometer as *K*, suspended by the wire *gr*, and immersed in the water of the glass vessel fig. 10. or in the trough fig. 11. during the progress of these experiments. Another *eudiometer* of a more simple kind consists of a straight glass tube *em* (fig. 13.) of an uniform diameter, about two or three feet long, with a large ball *i*, and a glass stopple *m* fitted air-tight to the mouth *x*, which should be wide open in the shape of a funnel. There is also a small siphon *kl*, fig. 14. with a brass ring *z*, a small phial *a*, fig. 15. the contents of which may occupy a third part of the ball *i*, or half the length of the glass tube *em*: to this instrument also belongs a ruler divided and stamped, like that already described. When this instrument is used it is filled with water, and placed in a vertical position with the mouth *x* under the surface of the water in a tub or trough: the phial *a* (fig. 15.) is filled first with nitrous air, which is thrown into the tube either by a glass funnel applied to its mouth, or when its mouth is wide enough, without any funnel: the phial is next filled with the air to be tried, which is thrown into the same tube. Then the siphon (fig. 13.) is immediately applied to the mouth of the *eudiometer* under the surface of the water; some of which is to be poured into it. Having watched the stationary moment of the greatest diminution of the mixed air at *by* means of the ring *z*, at that moment remove the siphon *kl*, and lay the *eudiometer* for some minutes under water in a horizontal position, or nearly so, that no part of the inclosed air may escape; shut the mouth *x* with the glass stopple *m*, and invert the instrument with the mouth *x* upwards. Lastly, measure the space occupied by the residuum of the diminished air, by applying to its side the divided ruler or scale, and eliminate the result as before. *Eudiometers* are used with water or with quicksilver; but the latter suffering a sensible action from the contact with nitrous air, and being both heavier and dearer than water, is less eligible than the former. An instrument of this kind is capable of being applied to important and useful purposes in determining the comparative fallibility of the air in different climates and situations. See Magellan's Letter to Dr. Priestley, containing the Description of a Glass Apparatus, &c. and of New *Eudiometers*, &c. 1777. p. 15-47; and Priestley's Exp. and Obs. on Air, vol. iii. Preface and Appendix. See also an account of easy methods of measuring the diminution of bulk, occasioned by the mixture of common and nitrous air, by Dr. Ingenhouz, in the Phil. Trans. vol. lxi. part i. art. 15. For an account of a new *eudiometer* by Mr. Cavendish, see Phil. Trans. vol. lxxiii. part i. p. 106. See *EVOLVIA*.

EUDOXIANS, a party or sect of heretics in the fourth century, so denominated from their leader Eudoxius, patriarch of Antioch and Constantinople, a great defender of the Arian doctrine.

The *Eudoxians* adhered to the errors of the Arians and Eunomians, maintaining that the Son was created out of nothing; that he had a will distinct and different from that of the Father, &c.

EVE. See *VIOLE*.

EVECTION, is used by some astronomers for the libration of the moon. See *LIBRATION*.

The term *evection* is used by some astronomers to denote that equation of the moon's motion, which is proportional to the sine of double the distance of the moon from the sun, diminished by the moon's anomaly: this equation is not yet accurately determined; some place it at 1' 30", others at 1' 16", &c. It is the greatest of all the moon's equations, except the *ANATYPSIS* of the centre.

EVEN *fact*, in Poetry. See *FOOT*.

EVEN *number*, is that which may be divided into two equal parts or moieties. See *NUMBERS*.

EVENING *star*. See *VESPER*.

EVENLY *even number*, is that which is exactly divisible by an even number taken an even number of times; such is 32, since it is divisible by 8, taken four times.

EVENLY *odd number*, is that which, an even number measures by an odd one; as 30, which is measured by 6, taken five times.

EVERARDS *sliding rule*. See *SIDRICK*.

EVERGETES, *Εὐεργέτης*, a Greek term, signifying *benefactor*, being formed of *εὖ*, *well*, and *εργάζομαι*, *span, work*. It is still retained in our language by way of addition or epithet given to two princes or kings of Syria and Egypt, who succeeded Alexander. Thus we say Ptolemy *Evergetes*, king of Egypt, Antiochus *Evergetes*, king of Syria.

EVER GREENS, a class of perennials, which continue their verdure, leaves, &c. all the year.

Of these our gardeners reckon twelve, which are peculiarly fit for English air, viz. the alternan, arbutus, bay-tree, box-tree, holly, juniper, laurestinus, phillyrea, pyracantha, or *evergreen* thorn, Italian green privet, and the yew-tree.

made a person, without any benediction. See the Jesuit Gretier, in his *Treasure de Benedictionibus & Maledictionibus*, lib. II. cap. 22. 24. &c. where he treats of *exiles* thoroughly.

From a passage in Bollandus, on the Life of S. Melaine, cap. 4. it appears, that *exiles* were not only of bread, but any kind of meat blessed and hallowed for that purpose. Add, that almost every body blessed and distributed *exiles*; not only bishops and priests, but even hermits, though laymen, made a practice of it. Women also would sometimes send *exiles*.

The wine sent as a present was also held an *exile*. Bollandus remarks farther, that the *exile* itself was also called *exile*.

EULOGY, *l'euologie* means an encomium on any person, on account of some virtue or good quality.

EUMARIDES, of *exmaris*, *vel*, among the *Asiatas*, a kind of shoes common to men and women.

The *exmarides* were used for pomp and delicacy, being neat, and painted with various colours.

EUMECES, in the *History of the ancient Naturalists*, the name of a stone, which Piny tells us resembled a flint, and was found in Bactria; the ancients had an idle opinion, that, if laid under the head, it occasioned true and prophetic dreams, foretelling to the person the more remarkable future events of his life. Hist. Nat. lib. xxxvii. cap. 10.

EUMENIDES, in *Antiquity*. See **FORIES**.

EUMENIDEIA, *Examinis*, in *Antiquity*, an annual festival observed in honour of the Furies. It was otherwise called *examinis*, because the Athenians called the Furies *examinis*, i. e. venerable judges.

EUMETRES *Bis*, in *Natural History*, the name given by the ancients to a gem which the Assyrians held sacred to their god, and which many other nations learned from them to suppose very powerful against magic. Many have supposed this to be the stone we now call oculus Belli; but this is an error, since Piny, in his account of the *cametres*, says, that it was of a very fine green. It was probably a gem of the emerald-kind, that stone having ever been in very high esteem in the Eastern part of the world, as it is also to this day.

EUMOLPIDES, in *Antiquity*, priests of Ceres, who had the power among the Athenians of initiating into the mysteries of this goddess, or excluding from them.

EUNOEIUS, a name given by some authors to the axites or eagle-stone.

EUNOMIANS, a sect denominated from Eunomius, bishop of Cysicus, who, in the fourth century, maintained most of the errors of Arius, and added others to them.

He repented such as had already been baptized in the name of the Trinity; he had dissembled his errors for some time; but having at length made a discovery, he was expelled his see.

The Arians endeavoured to have put him into that of Samothra, but could not effect it; in lieu thereof the emperor Valens restored him to Cysicus.

EUNOMIQUIPSYCHIANS, a sect of heretics of the fourth century, mentioned by Nicephorus, lib. xii. cap. 30. being the same with those called *Euchyrians* by Sozomen, lib. vii. cap. 17. See **EUCHYRIANS**.

EUNUCH, *Eunoxus*, a term applied in the general to all who have not the faculty of generating, either through imbecility or frigidity; but more particularly to such as have been castrated, or have lost some of the parts necessary for that purpose.

The word is formed of *euno* *euno*, q. d. *belli curam habet*, guarding, or keeper of the bed.

In England, France, &c. *eunuchs* are never made but on occasion of some disease which renders such an operation necessary; but in Italy they make *eunuchs* for the sake of preserving the voice; and in the East they make *eunuchs* to be guards or attendants on their women.

Great numbers of children, from one to three years of age, are yearly castrated in Italy to supply the operas and theatres, not only of Italy but other parts of Europe, with singers; though it is not one in three, that after having lost their virility, have a good voice for a recompense.

See **CONSERVATORIOS**.

Tavernier assures us, that in the Kingdom of Boutzen in the East Indies, there are every year made twenty thousand *eunuchs*, and fold thence into other countries.

The seraglio of the Eastern emperors are chiefly served and guarded by *eunuchs*; and yet we have very good testimonies, that the rich *eunuchs* in Persia and other countries keep seragios for their own use. This is a punishment of crimes in some countries. See **ADULTERY**. By an arrest of the grand chamber of Paris in 1665, it is adjudged that an *eunuch* could not marry, not even with the consent of the woman, and all the parties on both sides.

Claudian has a very severe satire against the *eunuch* Eutrope. Vol. II. N° 120.

pius, who had been elected consul of Rome. He represents him as an old woman, dressed up in the honours of the consulate.

In the council of Nice those were condemned, who, out of an indiscreet zeal, and to guard themselves from sensual pleasures, should make themselves *exiles*. Such as thus mutilated their bodies were excused from holy orders; witness Leontius, bishop of Autioch, who was deposed for having practised this cruelty on himself; and the bishop of Alexandria excommunicated two monks who had followed his example, on pretence of securing themselves from the impetuous motions of concupiscence. Several of the emperors made very severe prohibitions against the making of *eunuchs*, or people's castrating themselves. See **CASTRATION**.

EUNUCHS, **EUNUCHI**, is also the denomination of a sect of heretics in the third century, who had the folly or madness to castrate not only those of their own persuasion, but even all they could lay hands on.

They took their rise from the example of Origen, who, upon a misinterpretation of our Saviour's words in St. Matthew, chap. xix. ver. 12. made himself an *eunuch*, by cutting off the offending part, as some say, or, as others (particularly St. Epiphanius), by the use of certain medicines. These heretics were also called **VALENTIANS**.

EVOCATI, among the Romans, soldiers, who having served their time in the army, went afterwards volunteers at the request of some favourite general.

EVOCACTION, *Evocatio*, among the Romans, a religious ceremony always observed by them at undertaking the siege of a town, wherein they solemnly called upon the gods and goddesses of the place to forsake it and come over to them. Without the performance of this ceremony, they either thought that the place could not be taken, or that it would be a sacrifice to take the gods prisoners.

The form of *evocation* used at taking the city of Carthage is related by Macrobi. Sat. 1.11. 9.

They always took it for granted that their prayer was heard, and that the gods had deserted the place and came over to them, provided they were able to make themselves masters of it.

EVOCATORIÆ *epistole*, among the Romans, letters sent by the emperors to command the attendance of any person; or letters granting licence to any one to wait on the emperor; every person not being allowed this privilege till they had desired and obtained the *excohortatio* *epistole*.

EVOLENT, in *Geometry*, a term which some writers use for the curve resulting from the evolution of a curve; in contradistinction to the *evolvent*, which is the curve supposed to be opened or evolved.

The evolute always both touches and cuts the *evolvent* at the same time: the reason is, that it has two of its infinitely small sides in common with the *evolvent*; or, rather exactly placed on two equal sides thereof; one of them within-side that of the *evolvent*, i. e. on the concave side thereof; and the other on the convex side of its correspondent side; so that the evolute touches the *evolvent* in two points; whence, instead of being a tangent, it is said to osculate the *evolvent*; and, hence, it is also called *osculant*, and *circulus osculator*.

There is one, and but one osculator, to each point of the *evolvent*; but, to the same point, there are an infinity of other circles which only touch, and do not osculate. The osculator, and the evolute, make no angle in the place where they touch and cut; nor can any curve line be drawn between, as there may between a tangent and a curve.

EVOOLUTE, **EVOOLUTA**, in the *Higher Geometry*, a curve first proposed by Mr. Huygens, and since much studied by the later mathematicians.

The *evolvent* is a curve, supposed to be evolved, or opened; and which, in opening, describes other curves.

To conceive its origin and formation, suppose a flexible thread, wound exactly over the convexity of any curve, as *ABCG* (Tab. II. *Geometry*, fig. 34.) and suppose the thread fixed in *G*, and every where else at liberty, to *A*. Now, beginning to unwind the thread from the point, and continuing it to *D*, and, throughout, keeping it tight on the curve surface *ABCG*, when the thread is become quite straight, and is only a tangent, *FG*, to the curve in the point *G*, it is evident the extremity *A*, in its progress to *F*, has described another curve line *ADEF*.

Here, the first curve *ABCG*, is called the *evolvent*; each of its tangents *BD*, *CE*, &c. comprehended between it and the curve *ADEF*, called the *evolutes*, is called a *radius* of the *evolvent*, or *radius osculi*, *radius osculator*, or *radius of curvature*, of the curve *ADEF*, in the respective points *D*, *E*, &c. And the circles, whereof the osculators *BD*, *CE*, &c. are radii, are called *circuli osculatorii*.

plied by y is $x \frac{2+y}{y}$ = the general expression for

LE. Now, by help of the equation of the given involute curve, extimate x , y , and z , out of these expressions, and find the vertical distance AD. Then, if we put the absciss of the *evolute* DN = u , and its ordinate NE = v ; by help of these two equations, $u = DL - BC$, and $v = AC - AD + LE$, we may get the nature of the *evolute* curve DLE required.

Note. If the given involute be convex towards its axis, and x and y increase together, or the fluxions of x and y be both affirmative, then the general expressions for BL and LE will be $\frac{2+y}{y}$; and $\frac{2+y}{y}$ respectively; wherein the negative sign shows, that the points L and E must be taken on the concave side of the involute curve, that is, on the other side of it with regard to x and y .

E. gr. To find the nature of the curve AEP, fig. 42, by whose evolution the cycloid ABD is described.

For AC = a , CB = y , AF = z , and OD or

OF = a ; then by Ex. 2. art. 1. above, $z = \frac{2ay-y^2}{y}$

$z^2 = \frac{4ay^2 - y^4}{y^2}$, and $z = \frac{a}{y}$; wherefore, BL =

$\frac{2+y}{y} = \frac{2+ay-y^2}{ay}$ = $2y$, and LE = $z \times$

BL = $\frac{2+y}{y} \times \frac{2+y}{y} \times y = 2 \cdot \frac{2ay-y^2}{y}$. Hence, if

we put the absciss AN = u , and ordinate NE = v , we have u (= BL - CB) = $2y - y = y$, and v (= AC + LE) = $a + 2 \cdot \frac{2ay-y^2}{y}$, that is, (because $x = u - 2ay - y^2$) $v = a + \frac{2ay-y^2}{y}$, or, (writing a for y its equal), $v = a + \frac{2ay-u^2}{y}$.

Wherefore, the *evolute* curve AEP is a cycloid, and equal to the given cycloid ABD; for, let AS = SV = a , then (AN being = FL) AT = FG = a , and NT = $2au - u^2$ = IG; and therefore, AT + TN = $a + \frac{2au-u^2}{y}$, that is, AT + TN = NE, which is the property of the cycloid; therefore, the *evolute* AEP is a cycloid; and because AV = FI, therefore the cycloids AEP and ABD are equal. See CYCLOID.

The *evolute* of a spiral, or indeed of any other curve, may be described by finding the radii of curvature at several points in the involute; for then we shall have as many points in the *evolute*, through which if a curve line be drawn, it will be the *evolute* sought.

Wolf. Elem. Math. tom. I. p. 524, seq. or the Infinim. Petites de M. le Marquis de l'Hopital. Simpson's Fluxions, vol. I. p. 71. &c. And Rowe's Fluxions, edit. 3. 1767, chap. vi. and vii. p. 103-132.

Since the radius of an *evolute* is either equal to an arc of the *evolute*, or exceeds it by some given quantity, all the arcs of *evolutes* may be rectified geometrically, whose radii may be exhibited by geometrical constructions; whence we see why an arc of a cycloid is double its chord; the radius of the *evolute* being double the same, and the *evolutes* of a cycloid being itself a cycloid, equal and similar to the involute.

M. Varignon has applied the doctrine of the radius of the *evolute* to that of central forces; so that having the radius of the *evolute* of any curve, one may find the value of the central force of a body; which, moving in that curve, is found in the same point where that radius terminates; or reciprocally, having the central force given, the radius of the *evolute* may be determined. Hist. de l'Acad. Roy. des Sciences, an. 1706.

The variation of curvature of the line described by the *evolution* of a curve, is measured by the ratio of the radius of curvature of the *evolute*, to the radius of curvature of the line described by the *evolution*. See MACLAURIN'S FLUX. art. 402. prop. 36.

EVOLUTE, imperfect. M. Reaumur has given a new kind of *evolute*, under this denomination. Hitherto the mathematicians had only considered the perpendiculars let fall on the points of the convex side of the curve: if other lines not perpendicular were drawn upon the same points, provided they were all drawn under the same angle, the effect would be the same; that is, the oblique lines would all intersect within the curve; and, by their intersections, form the infinitely small side of a new curve; whereof they would be so many tangents. This curve would be a sort of *evolute*, and would have its radii; but an imperfect *evolute*, since the radii are not

perpendicular to the first curve. Hist. de l'Acad. &c. an. 1706.

EVOLUTION, in Geometry, the unfolding, or opening, of a curve, and making it describe an EVOLVING. The word *evolutio* is formed of the preposition *e*, out; and *volvo*, I roll, or wind; q. d. an unwinding, or breaking.

The equable *evolution* of the periphery of a circle, or other curve, is such a gradual approach of the circumference to rectitude, as that its parts do all concur, and equally evolve, or unbend; so that the same line becomes successively a less arc, of a reciprocally greater circle; till, at last, they change into a straight line. In the Philosophical Transactions, N° 260. a new quadratrix to the circle is found by this means, being the curve described by the equable *evolution* of its periphery.

EVOLUTION, is also used for the EXTRACTION of roots out of powers.

In which sense it stands opposed to *involution*.

EVOLUTION, in the Art of War, is a term applied to the diverse figures, turns and motions, made by a body of soldiers, either in ranging themselves in form of battle, or in changing their form; and this, whether in the way of exercise, or in the time of an actual engagement. It is by the *evolutions* that the form and posture of a battalion, squadron, &c. are changed, either to make good the ground they are upon, or to possess themselves of another, that they may attack the enemy or receive an onset more advantageously.

The military *evolutions* are conversions, countermarches, or wheelings, doublings of rank or file, &c. See EXERCISE.

Fr. Holte, a Jesuit, in 1697, printed a Treatise on Naval *evolutions*, in folio. By naval *evolutions* he means the motions made by a fleet, squadron, or naval armament, in order to put themselves in a proper disposition for attacking the enemy, or defending themselves with the most advantage.

EVOLVULUS, in Botany, a genus of the perianthia tetragyna class, having a five-leaved calyx, a cupated corolla divided into five segments, a three-leaved capsule, and a single seed. There are five species.

EUONYMODES, in Botany. See STAEDEA.

EUONYMUS, in Botany. See SPINDLE-TREE.

EUPATORIUM, in Botany. See HEMP AGRI-MONY.

EUPETALUS, in Natural History, the name of a gem described by the ancients as famous for its variety of colours. Pliny, lib. xxxvii. cap. 10. tells us, that it shewed at once blue, fire-colour, red-lead colour, and yellow. It seems to have been the opal, and that Pliny's description of it in this place was taken from some author he did not perfectly understand, as is the case in many of his accounts from the Greeks.

EUPHEMISMUS, Εὐφαισμός, of *eu*, well, and *phusis*, I speak, in Rhetoric, a figure which expresses things in themselves disagreeable and shocking, by terms implying the contrary quality; thus, the Pontus or Black Sea, having the epithet of *æthra* (i. e. *insupportable*) given it on account of the savage cruelty of those who inhabited the neighbouring countries; this name, by *Euphemism*, was changed into that of *Euxinus*. Thus Ovid. Trist. lib. iii. eleg. 13.

*Dum me terrarum patri perire celsissima Pontus
Euxinus falsis nomine dicitur habet.*

In which sense it only makes a species of irony. But every *euphemism* is not irony; for we sometimes use improper and soft terms in the same sense with the proper and harsh. See Voss. Rhet. lib. iv. cap. 196, seq.

EUPHONIC sound. See ACCENT.

EUPHONY, Εὐφωνία, in Grammar, an easiness, smoothness, and elegance of pronunciation.

The word is formed of *eu*, bene, well, and *phusis*, *phusis*. Quintilian calls *euphonia*, *euphonia*; Scaliger, *faciliis pronunciationibus*.

Euphonia is properly a kind of figure whereby we suppress a too harsh letter, or convert it into a smoother, contrary to the ordinary rules. There are examples enough in all languages.

EUPHORBIA, in Botany. See SPURGE.

EUPHORBIA, Εὐφορία, in Pharmacy, a gum brought from Africa, in little roundish pieces, whitish when new, and yellowish when old; very pungent to the taste and void of smell.

The principal use of *euphorbia* is external; it is a great ingredient in divers resolutive plasters as well as in tincture and powder for stopping of gangrenes, cleansing of foul ulcers, and exfoliating carious bones.

Internally taken, it is a purgative; but so violent a one, that it is almost out of use, as tearing off the necessary mucus, or covering of the stomach or bowels, and occasioning dysenteries. Yet, we are told the Africans use it

it very commonly; but they first quench its fire in pur-lain-water.

Its powder is a violent sternutatory, and to be used very cautiously, and never alone, but mixed with a small quantity of some other powder, to guard against its intolerable acrimony.

The gum we call *euphorbium* is formed of the juice of a plant of the same name, pretty frequent in Mauritania, though the species of the plant has been greatly controverted. The generality of our latest botanists make it a thorny, succulent plant; and Mr. Professor Hermann calls it the *ribesum mauritanicum* *aphyllis angustis* & *spinosis*. Hort. Acad. Lugd. Batav. 598.

The plant is the *eschola uulgaris* *multangulari*, *aculeis* *junioris* of Linnaeus.

It has no leaves; but in lieu thereof puts forth along its stem a kind of long, prickly eyes, or buds; which buds yield that gummy juice, called *euphorbium officinarum*. See Brasili. Gum. of Succul. Plants, dec. ii. p. 4. and dec. v. p. 12.

Some authors will have it, that the gum is drawn from the plant by incision; others, on the contrary, say it oozes spontaneously. The juice, we are told, is so very subtle and penetrating, that the person who taps the plant is forced to stand at a good distance, and make the incision with a long pike; & other wife it gets to the brain, and occasions dangerous inflammations. It oozes out in great abundance, and is gathered in sheep's skin, wrapped round the plant.

Pliny tells us, that the first discovery of *euphorbium* is attributed to Juba king of Libya, who denominated it from Euphorbus his physician, brother of Musa, physician to Agrippa. Emulser assures us, that the plant which yielded the *euphorbium* of the ancients is now unknown to us; but if we follow Pliny's description, the plant called *schidida calli*, in the Hortus Malabaricus, must be the ancient *euphorbium*. This discovery is owing to Commelinus, a barge-master of Amsterdam, and professor of botany.

EUPHORY, signifies the same as **EUCRACY**.

EUPHRASIA, in *Botany*. See **EYS-DWIGHT**.

EUPHROSYNUM, in *Botany*, a name used by Pliny and some others for the common borragine. See **BOURAGE**.

EUPHREA, of *so*, *well*, and *euo*, *I breathe*, in *Medicine*, is a right and natural respiration.

EUPORIA, of *so* and *eupos*, *passage*, in *Medicine*, is an easy preparation of medicines, or the easiness of their operation.

EUPUSCHIAN. See **EUNOMIOPUSCHIAN**.

EUREOS, in *Natural History*, the name of a stone, described by Pliny, and seeming plainly to be the same with the *tecolithus*, which he mentions in another place, and to be the stone now called *lapis Judaeus*, and known at this time to be the petrified juice of a sort of echinus marinus, or sea urchin.

EURIPTUS, *Eupreus*, in *Hydrography*, properly signifies a certain height of the sea between Boreia and Euboea, where the currents are so strong, that the sea is said to ebb and flow seven times a day; in which place, as the story commonly goes, Aristotle drowned himself out of chagrin, for not being able to account for so unusual a motion.

EURIPTUS has since become a general name for all streights, where the water is in great motion and agitation.

The ancient circles had their *Euripi*, which were no other than pits or ditches, on each side of the course, into which it was very dangerous falling with their horses and chariots as they ran races. The term *Euripus* was more particularly applied by the Romans to three canals or ditches which encompassed the circus on three sides, and which were filled occasionally, to represent nau-machis or sea-battles.

The same people called their smaller fountains or canals in their gardens *Euripsi*; and their largell, as cascades, &c. *Nili*.

EUROCLYDON, of *Euros*, *east-wind*, and *claydon*, *tower*, is a species of wind, of which we have an account only in Acts xvii. 24. and concerning the nature of which critics have been much divided. Bochart, Grotius, Bentley, and others, substitute another reading, supported by the Alexandrian MS. and the Vulgate, viz. *Eurospinos*, or *Eurospis*; but Mr. Bryant defends the common reading, and considers the *Euroclydon*, i. e. *Euros claydon*, as an east-wind that causes a deep sea or vast inundation. He maintains, in opposition to Dr. Bentley's reasoning, who supposes that the mariners in the ship, the voyage of which is recited in this passage, were Romans, that they were Greeks of Alexandria, and that the ship was an Alexandrine ship, employed in the traffic of carrying corn to Italy; and therefore, that the mariners had a name in their own language for the particular typhonic or stormy wind here mentioned. He

VOL. II. N° 120.

also shews from the passage itself, that the tempestuous wind called *Euroclydon*, beat (not *along*) upon the island of Crete; and therefore, as this is a relative expression, referring to the situation of the person who speaks of it, who was at that time to the windward or south of it, the wind blew upon shore, and must have come from the south or south-east; which, he adds, is fully warranted from the point where the ship was, and the direction it ran in afterwards, which was towards the north and north-west. Bryant's Observations, &c. 1767, p. 1, &c.

EURO-AsTER.

EURO-NISI. } See **WINDS**.

EURUS.

EUROPEAN Hours. See **Hour**.

EUROPEAN Ocean. See **OCEAN**.

EURYALE, in *Mythology*, one of the Gorgons, daughter of Phorcys, and sister of Medusa: she was subject neither to old age nor death.

EURYDICE, in *Mythology*, the wife of Orpheus, who, flying from Aëtiæus that endeavoured to ravish her, was slain by a serpent. Her husband went down to the shades, and by the force of his music persuaded Pluto and Proserpine to give him leave to carry back his wife; which they granted, provided he did not look on her till he came to the light; but he, breaking the condition, was forced to leave her behind him.

EURYNOμία, *Eurynomia*, in *Antiquity*, an anniversary solemnity in honour of Eurycnia, by some thought to be the same with Diana, by others one of Oceanus's daughters.

EURYTHMY, *Eurythmia*, in *Architecture*, *Painting*, and *Sculpture*, a certain majesty, elegance, and easiness, appearing in the composition of divers members, or parts of a body, building, or painting, and resulting from the fine proportions thereof.

The word is Greek, and signifies literally a *consonance*, or *fine agreement*, or, as we may call it, a *harmony of all the parts*, being compounded of *so*, *well*, and *euphros*, *rhythmus*, *concord*, or *agreement of numbers, sounds*, or the like things. Vitruvius ranks *eurythmia* among the essential parts of architecture: he describes it as consisting in the beauty of the construction or assemblage of the several parts of the work, which renders its aspect or whole appearance graceful; e. g. when the height corresponds to the breadth, and the breadth to the length, &c.

"From these three ideas or designs, viz. orthography, scenography, and profile, it is that *eurythmy*, majestic, and *eurythmia* *speciei adfectu*, do result, which creates that agreeable harmony between the several dimensions, so that nothing seems disproportionate, too long for this, or too broad for that, but corresponds in a just and regular symmetry, and consent of all the parts with the whole." Evelyn's Account of Archit. &c.

EUSEBES, the name of a species of marble mentioned by Pliny: he has given us no description of it, but only tells us, that there was a feat made of it in the temple of Hercules at Tyre, from which the priests pretended that the gods used to arise.

EUSEBIANS, a denomination given to the sect of Arias, on account of the favour and countenance which Eusebius, bishop of Cæsarea, shewed and procured for them at their first rise. See **ARIANS**.

EUSTATHIANS, a name given to the Catholics of Antioch in the fourth century, on occasion of their refusal to acknowledge any other bishop beside St. Eustathius, bishop of Sebasteia in Armenia, deposed by the Arians. The denomination was given them during the episcopate of Paulinus, whom the Arians substituted for St. Eustathius, about the year 330, when they began to hold their assemblies apart. About the year 350, Leontius of Phrygia, called the Eunuch, who was an Arian, and was put in the see of Antioch, desired the *Eustathians*, to perform their service in his church; which they accepted; and the church of Antioch served indifferently thus both for the Arians and Catholics.

This, we are told, gave occasion to two institutions, which have subsisted in the church ever since: the first was psalmody in two choirs; though Mr. Baillet thinks, that if they instituted an alternate psalmody between two choirs, it was between two Catholic choirs, and not by way of response to an Arian choir. The second was the doxology, *Gloria be to the Father, and the Son, and the Holy Ghost*.

This conduct, which seemed to imply a kind of communion with the Arians, gave great offence to abundance of Catholics, who began to hold separate meetings, and thus formed the schism of Antioch. Upon this the rest, who continued to meet in the church, ceased to be called *Eustathians*; and that appellation became restrained to the dissenting-party.

St. Flavianus, bishop of Antioch, in 381, and one of his successors, Alexander, in 422, brought to pass a coalition

tion or re-union between the *Eutychians* and the body of the church of Antioch, described with much solemnity by Theodoret, Eccl. lib. iii. cap. 2.

EUTYCHIANISM was also a sect of heretics in the fourth century, denominated from their founder Eutychius, a monk so foolishly fond of his own profession, that he condemned all other conditions of life. Whether this Eutychius was the same with the bishop of Scythia and chief of the Semi-monks, is not easily to determine.

He excluded married people from salvation; prohibited his followers from praying in their houses, and obliged them to quit all they had, as incompatible with the hopes of heaven.

He drew them out of the other assemblies of Christians to hold secret ones with him, and made them wear a particular habit: he appointed them to fast on Sundays; and taught them, that the ordinary falls of the church were needless, after they had attained to a certain degree of purity which he pretended to. He showed great horror for chapels built in honour of martyrs, and the assemblies held therein.

Several women, seduced by his reasons, forsook their husbands, and abundance of slaves deserted their masters' houses.

He was condemned at the council of Gangra, in Paphlagonia, held between the years 356 and 361. Socr. lib. ii. cap. 45. and Sozomen. lib. iv. cap. 24. Hard. Concil. Cell. tom. i. p. 530.

EUSTYLE, formed of *eu*, bene, well, and *style*, column, in architecture, a kind of edifice, where the columns are placed at a most convenient distance one from another, the intercolumniations being all just two diameters and a quarter of the column, except those in the middle of the fronts, before and behind, which are three diameters distant. See Tab. Archit. fig. 42. C.

The *eustyle* is a medium between the pycnostyle, and acrostyle.

Vitruius, lib. iii. cap. 2. observes, that the *eustyle* is the most approved of all the manners of intercolumniation, and that it surpasses all the rest in convenience, beauty, and strength.

EUTERPE, one of the nine Muses, which presided over wind-instruments: she is represented with a crown of flowers, playing on a double flute, with Cupid at her knees. 'To her the invention of tragedy is ascribed.

EURHYTHMIA, *Eurhythmia*, among the Greeks, signified such a disposition, or state of the mind, as could not be rusted either by good or bad fortune, by sickness or health, good or evil. Mem. Acad. Inscript. vol. xiv. p. 137.

EUTYCHIANISM, ancient heretics, who denied the divinity of natures in Christ; thus denominated from Eutyches, the archimandrite, or abbot of a monastery at Constantinople, who began to propagate his opinion A. D. 448.

The avarice Eutyches bore to the heresy of Nestorius, threw him into another extreme, not less dangerous than that he so warmly opposed; though some passages in St. Cyril, which raised the unity of the person of Jesus Christ very high, contributed likewise to his delusion.

At first he held, that the *Lagni Word*, brought his body down with him from heaven; which was near approach to the heresy of Apollinarius; and, though he afterwards testified the contrary, in a synod at Constantinople, wherein he was condemned, yet he could not be brought to acknowledge, that the body of Jesus Christ was substantial with ours.

In effect, he did not seem quite steady and consistent in his sentiments; for he appeared to allow of two natures, even before the union; which was apparently a consequence he drew from the principles of the Platonic philosophy, which supposes a pre-existence of souls; accordingly, he believed that the soul of Jesus Christ had been united to the divinity, before the incarnation; but then he allowed no distinction of natures in Jesus Christ since his incarnation.

See the dissertation of H. Handouin, De Sacramento Altaris; wherein that Jesuit endeavours to unfold all the sentiments of the *Eutychians*.

This heresy was first condemned in a synod held at Constantinople, by Flavian, in 448, approved by the council of Ephesus, called *Conventus iacturam*, in 449, and re-examined and fulminated, in the general council of Chalcedon, in 451. The legates of pope Leo, who assisted at it, maintained, that it was not enough to define, that there were two natures in Jesus Christ, but insisted strenuously, that, to remove all equivocations, they must add these terms, *without being changed, or confounded, or divided*.

The heresy of the *Eutychians*, which made a very great progress throughout the East, at length became divided into several branches. Nicephorus makes mention of no

fewer than twelve; some called *Monothites*, or *aspirantia*, as only attributing to Jesus Christ, a phantom, or appearance of flesh, and no real flesh; others *Theodiscians*, from Theodosius, bishop of Alexandria; others *Jacobites*, from one James, *Jacobus*, of Syria, which branch established itself principally in Armenia, where it still subsists. Others were called *Asaphites*, &c. &c. &c. &c. and *Syrianism*, from a monk called Severus, who fixed on the see of Antioch in 513.

These last were subdivided into five *schisms*, viz. *Jacobi*, who attributed some ignorance to Jesus Christ; the followers of Paul; *Monothites*, that is the *Real Angelites*, thus called from the place where they were assembled; lastly, *Asaphites*, and *Comenites*.

EUTYCHIANISM was also the name of another sect, half Asian, half Eumonian; which arose at Constantinople, in the fourth century.

It being then a matter of mighty controversy among the Eumonian at Constantinople, whether or no the Son of God knew the last day and hour of the world, particularly with regard to that passage in the gospel of St. Matthew, chap. xxiv. ver. 30. or, rather, that in St. Mark, xiii. 32. where it is expressed, that the Son did not know it; which sentiment dispiriting the leaders of the Eumonian party, he separated from them, and made a journey to Eusebius, who was then in exile.

That heretic acquiesced fully in Eutychius's doctrine, and admitted him to his communion; Eusebius dying soon after, the chief of the Eumonian at Constantinople refused to admit Eutychius, who, upon this, formed a particular sect of such as adhered to him, called *Eutychians*.

This same Eutychius, with one Theophrastus, as was said in Sozomen's time, were the occasions of all the changes made by the Eumonian in the administration of baptism; which consisted, according to Nicephorus, in only using one immersion, and not doing it in the name of the Trinity, but in memory of the death of Jesus Christ.

Nicephorus calls the chief of that sect not Eutychius, but Euphychius, and his followers Eumoniourpocritians.

EWAGE, *Evagium*, in our Old Writers the same with *ewage*, which is toll paid for water-passage. It is derived from the French *eau*, water.

EWEL, the English name for a female *Suitor*.

EWRY, an office in the king's household, where they take care of the linen for the king's table; lay the cloth, and serve up water in silver ewers after dinner, whence the office takes its name.

EXACERBATION, the same as *Parkozestis*.

EXACHORD. See *HEXACHORD*.

EXACTION, in Law, a wrong done by an officer, or one pretending to have authority: to taking a reward, or fee, for that in which the law allows not of any.

The difference between *exaction* and *extortion*, consists in this; that *extortion* is, where the officer takes more than his duty; and *exaction*, where he takes a fee, or reward, where none is due.

EXACTIS, in *Natural History*, a name given by Linnæus, and some other authors, to a species of flax-fish, of the more branched kind, whose rays are six in number, when they first part from the body, but very soon branch out into a great number more. See *STRAUS*.

EXACTOR *regis*, in Law, the king's exactor, or collector. Sometimes it is taken for the sheriff. But generally, *exactor* publicus, pecuniaris, tributa, vigiliae &c. *Ex actoribus excise, publicis, pecuniaris, tributa, vigiliae &c. Ex actoribus excise, publicis, pecuniaris, tributa, vigiliae &c.*

EXACUM, in Botany, a genus of the *tetrandria monogamia* class; the calyx has four leaves, the corolla is divided into four segments, and has a globose tube, the capsule is bilocular, marked with two furrows, opens at the top, and contains many seeds. There are two species.

EXAGON. See *HEXAGON*.

EXERESIS, *Exeresis*, of *exeresis*, I take off, in Surgery, an operation, whereby furnishing foreign vessels, and even penicula, is taken from the human body.

The *exeresis* is performed two ways; by extraction, when something formed in the body is drawn out of the time; and by detraction, when something is taken away, that had been introduced into the body, from without. See *LYTHOTOMY*, &c.

EXAGGERATION, in Rhetoric, a figure whereby we enlarge or heighten things; making them appear more than they really are, whether as to goodness, baseness, or other qualities.

The word is formed of the Latin *exagger*, I exaggerate, which is a compound of *ex* and *aggr*, a mound, or elevation of earth. See *HYPERBOL*.

EXAGGERATION, in Painting, is a method of representing things, wherein they are loaded too much, or marked

too strongly; whether in respect of the design, or the colouring, or the position of the object.

Exaggerating differs from caricaturing; in that the latter perverts, or gives a turn to the features, &c. of a face, which they had not; whereas the former only improves, or heightens, what they had.

The latter is a kind of burlesque on the object, and is generally meant to ridicule: the former is usually an exalting or ennobling of the beauties of the object, beyond what nature allows. The painter is obliged to have recourse to an *exaggeration* of colours, both on account of the surface of his ground, the distance of his work, and of time, and the air, which diminish and weaken the force of the colours; but this *exaggeration* must be conducted in such manner, as not to put the objects out of their natural character.

EXALTATION, *Ele-asis*, is chiefly used in a figurative sense, for the raising or advancing a person to some ecclesiastical dignity; and particularly to the papacy.

The term *exaltation* is, in some measure, appropriated to the pope; and expresses his *INAGURATION*, consecration, taking possession, and the beginning of his pontificate.

EXALTATION of the Cross, EXALTATIO CRUCIS, is a feast of the Romish church, held on the fourteenth of September; in memory, as it is generally supposed, of that, that the conqueror *HERACLIUS* brought back the true cross of Jesus Christ on his shoulders, to the place on mount Calvary, from which it had been carried away fourteen years before, by COLOSSUS, king of Persia, at his taking of Jerusalem, under the reign of the emperor PHILAS. See CROSS.

The cross was delivered up by a treaty of peace made with Siroe, COLOSSUS' son. The inscription of this treaty is commonly said to have been legalized by a miracle: in that HERACLIUS could not lift out of Jerusalem with the cross, while he had the imperial vestments on, enriched with gold, and precious stones; but bare it, with ease, in a common dress.

But, long before the empire of HERACLIUS, there had been a feast of the same denomination observed both in the Greek and Latin churches, on occasion of what our Saviour said in St. John xii. 32. *And I, if I be exalted, or lifted up, will draw all men unto me.* And again, in ch. viii. ver. 28. *When I have exalted, or lifted up, the Son of man, then shall ye know that I am he.* F. Du Soulier assures us, that M. Chastelain was of opinion, this feast had been instituted, at least at Jerusalem, two hundred and forty years before HERACLIUS.

The feast of the dedication of the temple built by Constantine was held, says NICEPHORUS, on the fourteenth of September, the day on which the temple had been consecrated, in the year 335; and this feast was also called the *revelation of the cross*, because it was a ceremony therein, for the bishop of Jerusalem to ascend a high place, built by Constantine for that purpose, in manner of a pulpit, called by the Greeks, the *throne of God*, or the *throne of God*, and there built up the cross, for all the people to see it.

EXALTATION, in Physics, denotes the act, or operation, of elevating, purifying, subtilizing, or perfecting, any natural body, its principles and parts; so the quality, or disposition, which bodies acquire by such operations.

The term *exaltation* has been peculiarly affected by the chemists and alchemists; who, imagining it to have some extraordinary emphasis, are employing it on every occasion.

EXALTATION, in Astronomy, is a dignity which a planet acquires in certain lights, or parts, of the zodiac; which dignity is supposed to give it an extraordinary virtue, efficacy, and influence. The opposite sign, or part of the zodiac, is called the *dejection* of the planet.

Thus, the 15th degree of Cancer is the *exaltation* of Jupiter, according to ALBUMAZAR, because it was the ascendant of that planet at the time of the creation; that of the sun is in the 19th degree of Aries; and its dejection in Libra; that of the moon is in Taurus, &c. Ptolemy gives the reason of this in his first book De Quadrap.

EXAMEN, or EXAMINATION, an exact and careful search, or inquiry, in order to discover the truth, or falshood, of a thing.

EXAMINATION is a point much insisted on by divines, and particularly the ancient fathers; by way of preparation to repentance. St. Ignatius reduced it to five points; viz. 1. A returning of thanks to God for his benefits. 2. A begging of grace and light, to know and distinguish our sins. 3. A running over all our actions, occupations, thoughts and words, in order to learn what has been offensive to God. 4. A begging of pardon, and conceiving a sincere sorrow for having displeased him. And, 5. Making a firm resolution not to offend him any more; and taking the necessary precautions to preserve ourselves from it.

EXAMILION, &c. See HEXAMILION, &c.

EXAMINERS, in Chancery, are two officers, whose business is to examine, on oath, the witnesses produced on both sides, upon such interrogatories as the parties to the suit do exhibit for the purpose.

EXAMPLE, in Rhetoric, denotes an imperfect kind of induction, or argumentation; whereby it is proved, that a thing which has happened on some other occasion, will happen again, on the present one, from the similitude of the cases.

EXANNUAL Roll. In the old way of exhibiting sheriff's accounts, the illeivable fines and desperate debts were transcribed into a roll, under this name; which was yearly read, to see what might be gotten by it.

EXANTHEMA, formed of *Exanth*, I flower, in *Medicines*, a preternatural eruption, or efflorescence, on the skin.

Exanthemata are of two kinds; the one only a discolouring of the skin; such as the measles, the purple spots in malignant fevers, &c. The other are little eminences, or papules, standing out from the skin; such are pock, small-pox, &c.

EXARCH, *Exarchus*, an appellation given, by the emperors of the East, to certain officers sent into Italy, in quality of vicars, or *præfides*, to defend that part of Italy which was yet under their obedience; particularly the city of Ravenna, against the Lombards, who had made themselves masters of the greater part of the rest.

The residence of the *exarch* was at Ravenna; a city, with that of Rome, were all that was left the emperors. The first *exarch* was the partisan Doctor, famous for his treatise, De Consolatione Philosophiæ, composed in 568, by the younger Justin. The *exarch* subsisted about a hundred and eighty-five years, and ended in Eutychius; under whose *exarchate* the city of Ravenna was taken by the Lombard king Astolphus, or Astolph.

F. Popebroch, in his *Prolegomena ad Alia Sancti Marci*, has a dissertation on the power and office of the *exarch* of Italy, in the election and ordination of the pope.

The emperor Frederic created HERACLIUS, archbishop of Lyons, a descendant of the illustrious house of Montbottier, *exarch* of the whole kingdom of Burgundy; a dignity, till that time unknown any where but in Italy, particularly in the city of Ravenna. Menclier. Hist. de Lyons.

Homer, Philo, and other ancient authors, give, likewise, the name *exarchus* to the choragus, or master of the singers, in the ancient choruses, or him who sung first; the word *exarch*, or *exarchus*, signifying equally *to begin*, and *to command*.

EXARCH of a diocese, was, anciently, the same with *primate*. This dignity was inferior to the patriarchal, yet greater than the metropolitan.

EXARCH also denotes an officer, still subsisting in the Greek church, being a kind of deputy, or legate *à legs* of the patriarch, whose office it is to visit the provinces allotted him, in order to inform himself of the lives and manners of the clergy; take cognizance of ecclesiastical causes, the manner of celebrating divine service; the administration of the sacraments, particularly confession; the observance of the eastern monastic discipline; affairs of marriages, divorces, &c. but, above all, to take an account of the several revenues which the patriarch receives from several churches; and, particularly, as to what regards the collecting of the tithes.

The *exarch*, after having greatly enriched himself in his post, frequently flies to the patriarchate itself.

EXARCH is also used, in the *Eastern Church* *Antiquity*, for a general, or superior over several monasteries; the same that we otherwise call archimandrite; being exempted, by the patriarch of Constantinople, from the jurisdiction of the bishops; as are now the generals of the Romish monasteries.

In 1033, Selas was established *exarch*, or chief, of all the anchorites within the territory of Jerusalem. Du Bois.

EXARTICULATION, a dislocation of some of the jointed bones; or a breach of articulation. See LUXATION.

EXAUCTIONATIO, among the Romans, differed from *missio*, or a discharge. In the latter, the soldiers were quite dismissed from the service; and this was done after they had served twenty years; but in the former case, they only lost their pay, being still kept under their colours or *corvæ*, though not under the *exile*, *exilis*, a dish was the standard of the legion. Whence, joined to *legionarii*, they were called *exilarii*, and were still retained till they had either served out their time, or had an *indulgentia* granted them. The *exilarii* commonly took place after they had served seventeen years.

EXCALCATION, *ex-calc*, and *calceus* foot, a calcillation, or the act of putting on the shoes.

Among the Hebrews there was a particular law, whereby

A widow, whom her husband's brother refused to marry, had a right to summon him into a court of justice; and upon his refusal, might *excothate* him, i. e. pull off one of his shoes, and spit in his face; which were both actions of great indignity among that people.

The house of the person who had undergone them, was, therefore, called the house of the *excothate*.

EXCAMBIATOR. See **EXAMPIO**, and **EXCHANGE**.

EXCAVATION. formed of *ex*, and *cavus*, *hollow*, or *cave*, a pit, &c. the act of hollowing, or digging a cavity, particularly in the ground.

The *excavation* of the **FOUNDATIONS** of a building, by the Italians called *scavatore*, is settled, by Palladio, at a fifth part of the height of the whole building; unless there be cellars under ground, in which case he would have it somewhat more.

EXCELLENCY, a quality, or title of honour, given to ambassadors, and other persons, who are not qualified for that of highness, as not being princes; and yet are to be believed above the other inferior dignities.

In England, and France, the title is now peculiar to ambassadors; but it is very common in Germany and Italy. Those to whom it was first appropriated were the princes of the blood, of the several royal houses; but they quired it for that of highness, upon several great and shining occasions.

The ambassadors have only borne it since the year 1593, when Henry IV. of France, sent the duke de Noisy ambassador to the pope, when he was first complimented with *excellency*. After that, the same appellation was given to all the other ambassadors residing at that court; from whence the practice spread through the other courts.

The ambassadors of Venice have only had it since the year 1639, when the emperor and king of Spain consented to allow it them.

The ambassadors of the crowned heads, dispute the giving of that title to the ambassadors from the princes of Italy; where the practice is not established.

The court of Rome never allows the quality of *excellency* to any ambassador who is a churchman, as judging it a secular title. The common rules and measures of *excellency* are a little variable, with respect to the court of Rome. The ambassadors of France, at Rome, anciently gave the title of *excellency* to all the relations of the pope then reigning; to the Constable Colonna; to the duke of Bracciano, and the eldest sons of all those lords; as also the dukes of Savelli, Cefarini, &c. But they are now more reserved in this respect; though they still honour all the Roman princefesses with *excellency*.

The court of Rome, in their turn, and the Roman princes, bestow the same title on the chancellor, ministers, and secretaries of state, and presidents of the foreign courts of France; the presidents of the councils in Spain; the chancellor of Poland; and those of the first dignities of other states, if they be not ecclesiastics.

The word *excellency* was, anciently, a title of kings and emperors; accordingly Ananias the library-keeper calls Charlemagne his *excellency*. The same title is still given to the senate of Venice; where, after saluting the doge under the title of *serenissimo*, the senators are addressed under those of your *excellency*. The Liber Diurnus Pontificis Romæ gives the title *excellency* to the exarch and patriarchs.

The Italian and French have improved on simple *excellency*, and made *excellētissimo*, and *excellētissime*, which have been bestowed on certain popes, kings, &c.

EXCELSIS. See **GLORIA IN EXCELSIS**.

EXCENTRIC. In *Geometry*, is applied where two circles, or spheres, though contained, in some measure, within each other, yet have not the same centre; and, consequently, are not parallel; in opposition to *concentric*, where they are parallel, having one and the same common centre. The sun's orbit is *excentric*, with regard to the globe of the earth; Mars is very *excentric*, with regard to the sun; that is, his motion is about a very different centre.

EXCENTRIC, in the *New Astronomy*, or *excentric circle*, is a circle; as PDAE (Tab. Astron. fig. 1.) described from the centre of the orbit of the planet C, with half the axis CE, as a radius.

EXCENTRIC, or *excentric circle*, in the ancient Ptolemaic *Astronomy*, was the very orbit of the planet itself, which it was supposed to describe about the earth, and which was conceived *excentric* thereto; called also the **DEFERENT**.

In lieu of *excentric circles* round the earth, the moderns make the planets describe elliptic orbits round the sun; which accounts for all the irregularities of their motions, and their different distances from the earth, &c. more justly and naturally.

EXCENTRIC, *anomaly of the*, is an arch of the *excentric circle*; as AK, intercepted between the aphelion A, and

the right line KL, which, passing through the centre of the planet K, is drawn perpendicularly to the line of the apides AP.

EXCENTRIC equation, in the *Old Astronomy*, is an angle made by a line drawn from the centre of the earth, with another drawn from the centre of the *excentric*, to the body, or place, of any planet; the same with the prosthaphæretic, and equal to the difference (accounted in an arch of the ecliptic) between the sun's, or a planet's, real, and apparent place. See **EQUATION of the centre**.

EXCENTRIC place of a planet, in its orbit, is the PLACE wherein the planet is seen from the sun.

EXCENTRIC place, in the ecliptic, is the point of the ecliptic to which the planet, viewed from the sun, is referred.

This coincides with the heliocentric place.

EXCENTRICITY, the distance between the centres of two circles, or spheres, which have not the same centre. **EXCENTRICITY**, in the *Old Astronomy*, is the distance of the centre of the orbit of a planet from the centre of the earth.

That the five planets have such an *excentricity*, is allowed on all sides, and may be evinced from several considerations; chiefly this, that Saturn, Jupiter, Mars, Venus, and Mercury, at sometimes appear larger, and at others less; which can only proceed from hence, that their orbits being *excentric* to the earth, in some parts thereof they are nearer us, and in others more remote; but as to the *excentricities* of the sun and moon, some dispute has been made.

Many of the moderns hold, that the sun and moon appear sometimes larger, and sometimes less; not that they are nearer us at one time than another, but because they are viewed through different columns of air, which, producing a difference in the refraction of their light, may occasion those different appearances. Accordingly, we find very sudden alterations of the apparent magnitude of the moon, where nothing but a change in the air can take place.

Thus Kepler, on the 2d of March, in the year 1588, found the moon's apparent diameter 31 minutes, presently after 32', 2'', then 30' 3''; and the preceding day it had been 33'. And again, on the 22d of February, 1591, he observed the moon's diameter twice 31', six times 32', seven times 33', and six times 34'.

They add, that when the sun and moon are in the southern signs, and consequently lower, being then seen through a longer column of dense air, they must appear bigger; consequently, in the winter-time, when the sun is in Capricorn, being seen through a greater quantity of air, he must appear larger than in summer, when, being nearer our zenith, the quantity of air he is seen through is less. And the like may be said of the moon.

But others take the *excentricities* of the sun and moon to be sufficiently proved, from eclipses; from the moon's greater and less parallax, at the time distance from the zenith; and from the sun's being observed to continue longer in the northern hemisphere than in the southern; viz. 186 or 187 days in the first, and only 178 or 179 days in the latter.

If we suppose the mean distance of every planet from the sun to be divided into 1000 equal parts, the *excentricities* of their orbits, both in such parts, and in English miles, will be as follow: Mercury's 210 parts, or 717,30,000 miles; Venus's 7 parts, or 482,000 miles; the earth's 17 parts, or 1,018,000 miles; Mars's 93 parts, or 13,486,000 miles; Jupiter's 48 parts, or 23,760,000 miles; Saturn's 55 parts, or 49,940,000.

EXCENTRICITY, in the *New Astronomy*, is the distance of the centre of the orbit of a planet, as C, from the centre of the Sun S, i. e. the distance between the centre of the ellipse and the focus thereof; called also *single* or *major excentricity*.

If the greatest **EQUATION** of the centre be given, the *excentricity* of the earth's orbit may be found by the following proportion: as the diameter of a circle in degrees is to the diameter in equal parts, so is the greatest equation of the centre in degrees to the *excentricity* in equal parts: thus circumference 3,141,5926 : 1 its diameter :: 360° : 114° 59' 1399, the diameter in degrees; and if the greatest equation of the centre be 1° 55' 33" = 1° 9268166, &c. we shall have 114° 59' 1399 : 1.00, &c. :: 1,9268166 : 0,168061, the *excentricity*.

Hence 1,01806 (= 1,000000 + 0,01806) = the aphelion distance:

And 0,98194 (= 1,000000 - 0,01806) = the perihelion distance. Robertson's Elem. of Navig. book v. p. 286.

EXCENTRICITY, *double*, is the distance between the two foci in the ellipse; which is equal to twice the *single excentricity*.

To find the *excentricity* of the sun: since the sun's greatest apparent semidiameter is to his least, as 32' 43" to 31' 38",

or in 1953 to 1898 is the sun's greatest distance from the earth will be to his least in 1963 to 1898. Since then $PS + SA = PA = 386$ (Tab. *Astron.* fig. 7); the radius of the eccentric CP will be found 1930; and consequently $SC = PC - PS = 32$. Wherefore CP being 1000, C's will be found = 105.8.

Hence, as the earth's eccentricity SC is so small a part of the radius of the *vernal* CP, the earth's elliptic orbit does not differ much from a circular one: so that it is no wonder a calculation, made on the supposition of an *eccentric* circle, should answer near enough to observation. EXCEPTION, something reserved, or set aside, and not included in a rule.

It is become proverbial, that there is no rule without an *exception*: intimating, that it is impossible to comprehend all the particular cases under one and the same maxim. But it is dangerous following the *exception* preferably to the rule.

EXCEPTION, in Law, is a stop or stay to an action.

The term is used indifferently, both in the civil and common law; and in each, *exceptions* are divided into *dilatory* and *peremptory*.

In law proceedings, *exception* is a denial of a matter alleged in bar to the action; and in chancery it is that which is alleged against the sufficiency of an answer, &c. *Exceptions* in a general sense, includes all the kinds of defects, or violations, which a *person*, against whom a piece of litigation, makes use of to prevent or retard its effect.

The civilians reckon three kinds of *exceptions*; viz. *dilatory*, whereby the authority of the judge, or court, is disallowed; *dilatory*, intended to delay, or prevent the thing from coming to an issue; and *peremptory*, which are proper and permanent allegations, founded on some pretence that limits for the defendant; as want of age, or other quality, in the party; or other matter, that may be decided, without entering into a full discussion of the merits of the cause.

EXCEPTION *indecussa*, in Law, is where a defendant is offered in any civil cause, on account of the insufficiency of the evidence given, and the court does not agree to it; in which case, the court, or judge are required to find a *bill of exceptions*, by Rat. *Weston* 2. 13 *Edw. 1. cap. 21*, which is in the nature of an appeal, examinable in the next immediate superior court, upon a writ of error, after judgment given in the court below. See *DEMONSTRATION*.

EXCEPTION *in doli and tortious*, is the taking of a particular thing out of a general one granted by deed, as a *vine, vine, or cellar*, out of a house; a field, or timber tract out of land, &c. *Exception* of this kind must not cross the grant, nor be repugnant to it, or else they are void of course; yet there may be a kind of *exception*, or saving out of an *exception*, so as to make a thing at it never excepted; as where a lease is made of a tithery, excepting the parsonage house, giving to the lessee a chamber, this shall pass by the lease.

EXCEPTIVE *negation*. See *CONJUNCTION*.

EXCEPTIVE *proposition*, are those wherein something is affirmed of a whole subject, about some one of the parts thereof, which is *excepted* by a particle, thence called an *exceptive* particle, or particle of *exception*.

Thus, "All the sects of the ancient philosophers, except the Platonists, held God to be corporeal." *Corporal* is inexcusable in respect of every thing, but time.

EXCESS is distinguished into *natural* and *moral*: the *first*, is a part whereby one quantity is greater than another. Thus, we say, this line is longer than that: but the *second* is inconsiderable.

The *latter*, is an intemperance, or going beyond the just bounds and measure prescribed for any thing. Thus, we say, *excess* in wine, women, &c. is prejudicial to the health.

EXCHANGE, in *arithmetic*, is the reduction of different coins, or any denominations of money, whether there be real value answering to them, or no, from one to another; or the method of finding how many of one species, or denomination, are equal in value to a given number of another; in order by which it is necessary to know the value of the coins and monies of account of different countries, and their proportion to each other, according to the settled rate of *exchange*. See *COIN*. The several operations in this case are only different applications of the *rule of three*.

Ex. 1. England *exchange* with France on the crown or sea of three livres *Tournois*, allowing a certain number of pence sterling, more or less according to the rate of *exchange*, for this crown. Accounts are kept in France in livres, sols, and deniers. See *COIN*. Suppose then that a remittance is made from Paris to London of 1000 livres 14 sols, at 20d. sterling *exchange*, what is the amount in pounds, &c.? Divide the livres, sols, and

VOL. II. N° 111.

deniers by 3, in order to reduce them into French crowns; then multiply the crowns by 20, the number of pence in a crown, and take the aliquot parts for the fractional parts, according to the subdivisions of the integers, or reduce them into decimals, and reduce the pence into shillings and pounds as below:

Divide by 3	1000	14
	Cr.	335
		114
Mult. by	20	
	6700	
	140	
	11	
	11	
	220735	
	20811	
	406	116

When sterling money is to be reduced into French *exchange* crowns, reduce the sum given, and price of *exchange*, into the same denomination; and divide the former by the latter; and the crowns may be reduced to livres by multiplying the quotient by 3. The rate of *exchange* may be had by dividing the number of pence sterling by the number of French crowns, &c. in the given sum.

Ex. 2. England *exchange* with Holland, Antwerp, and Hamburg, at 60 many *schellings*, or *sealins* and groots Flemish per pound sterling. See *Tab. COIN*.

If London draws on, or remit to Amsterdam 824 121. 6d. sterling, at 34 *sch.* 41 *gr.* Flemish per £ sterling, how many *guldens*, *stivers*, and *pennings*, must be paid or received in bank money in Amsterdam? i.e. If 1 £ sterling gives 34 *sch.* 41 *gr.* what will 824 121. 6d. give? Reduce the price of *exchange* to 4 groots, which, multiplied by the pounds sterling, gives the half groots contained in that sum; and for the 121. 6d. take 101. as the half of 202; and an 164. as the fourth of that quotient; add the whole together, and the sum total is the number of half Flemish groots contained in the sterling money; which, being divided by 80, the half groots in a *guilder*, gives the answer in *guldens*; and the remaining half groots must be reduced to *stivers* and *pennings*. The operation is as follows:

<i>£.</i>	<i>s.</i>	<i>d.</i>	<i>Sc.</i>	<i>gr.</i>
824	12	6	at	24
				41
				12
				1250
				412
				1704
				2
				6816
				half gr.
101.	=	412		
21. 6d.	=	103		

£10 7034 15

824 *guldens*, 55 half groots $\frac{1}{2}$. But 55 half groots are = 27½ groots = 13 *stivers* 12 *pennings* and $\frac{1}{2}$ of the half groot = 2½ *pennings*; therefore the whole sum will be 824 *guldens* 13 *stivers* 14½ *pennings* bank money.

This example may be easily reversed, by reducing the Dutch money, and price of *exchange*, into one denomination; and dividing the sum by the price; the quotient will give the answer in pounds sterling.

Ex. 3. England *exchange* with Spain upon the *piastre*, or dollar of 8 rials; for an uncertain number of pence sterling. See *Spanish COIN*.

Suppose *Spain* remit to London 3537 dollars, 6 rials, at 40s per dollar, what will this remittance amount to in England? Multiply the dollars, by 40; take the half of 40s for 4 rials, and the fourth for 2 rials; add the whole, which will give the sum in pence: thus,

3537	6
40	
141480	
3094	
202	
101	
141605	
210	12050 5

6051. 101. 32½ sterling.

Ex. 4. England *exchange* with Portugal on the *milreis*, and gives pence, more or less, for 1. See *Portuguese COIN*.

Suppose that Lisbon, or Oporto, remits in London 4760 milliers, 183 reas, at 57 5/8 sterling, how much sterling must be paid in London for this remittance? The milliers, containing 1000 reas, there may be considered as denarii, there 1/2 being 1/4 of a pound, 500 of 1/4 and 1/2 the 1/4 divide accordingly, and sum up the whole, then reduce crowns of a pound into shillings, &c. The operation is as follows:

$$\begin{array}{r} 4760,183 \\ 57 \frac{5}{8} = \frac{1}{8} \times 1091,54175 \\ 57 = 1 \times 509,62145, & \text{&c.} \\ 5 = \frac{1}{4} \times 11,97026, & \text{&c.} \\ \hline 1,109,8915, & \text{&c.} \\ \hline 12 \\ \hline 17,523 \\ \hline 12 \\ \hline 6,756 \\ \hline 4 \\ \hline 3024 \end{array}$$

The answer is 1752l. 12s. 6d. sterling.

The foregoing example illustrates the general method of finding the *exchange* between England and any other country to which its commerce extends. But so considerable advantages may often be made by arbitrating the *exchange* between different countries with accuracy, the following examples will explain the method of doing this in all common cases.

Ex. 6. Suppose London *exchange* on Amsterdam at 35 = 24

And on Paris at 32 = 1
What is the proportional arbitrated price between Amsterdam and Paris?

1 Paris crown = 32 1/4 London.
2400 London = 421 1/2 groats Amsterdam = 35 = 12 1/2
See Coroll.

Then if 2400 gives 421 1/2 groats, what will 3000 give? But at the multiplication and division of quantities, partly integral and partly fractional, require a knowledge of vulgar and decimal fractions, which some men of business are not possessed of, there are methods which may be resorted to in practice, that will obviate such difficulties. It is well known, that if equal quantities are multiplied and divided by equal quantities, the numbers resulting from such operations will bear the same proportion to each other with the numbers first given.

Thus, in the preceding example, $\frac{2400 \times 35}{2400 \times 24} = \frac{3000 \times 35}{2400 \times 24}$

$$\frac{2400 \times 35}{2400 \times 24} = \frac{845 \times 207}{2400 \times 24} = \frac{61}{1} \times 257 = \frac{15629}{2400 \times 24}$$

$$= 36 \text{ groats Amsterdam } 2 \frac{1}{2}$$

Ex. 6. Let Paris *exchange* on London at 32 1/4

On Amsterdam at 35 = 24

What is the proportional arbitrated price between London and Amsterdam?

$$\frac{32 \frac{1}{4} \text{ sterling} = 2400}{32 \frac{1}{4} = 361 \frac{1}{4} \text{ groats}}$$

$$\frac{32 \frac{1}{4} \times 361 \frac{1}{4} \times 1240}{32 \frac{1}{4} \times 361 \frac{1}{4}} = \frac{2400 \times 361 \frac{1}{4}}{32 \frac{1}{4} \times 361 \frac{1}{4}} = \text{(multiplying nu-}$$

$$\text{merator and denominator by 168 and 8)} \frac{414128 \times 4}{257 \times 4} = 221 \frac{1}{4} \text{ groats}$$

$$= 35 \frac{1}{4}$$

Ex. 7. Let Amsterdam *exchange* on London at 35 = 24

On London at 32 = 1

What is the proportional arbitrated price between London and Paris?

1 Paris crown = 32 1/4 groats.

421 1/2 groats = 2400 sterling.

$$\frac{421 \frac{1}{2} \text{ gr.} \times 2400 \text{ gr.} = 50 \frac{1}{2} \text{ gr.}}{421 \frac{1}{2} \text{ gr.} \times 2400 \text{ gr.} = 50 \frac{1}{2} \text{ gr.}}$$

$$\frac{421 \frac{1}{2} \times 2400 \times 32 \frac{1}{4}}{421 \frac{1}{2} \times 2400} = \frac{96 \times 421 \frac{1}{2}}{169 \times 768} = \frac{33 \times 476 \frac{1}{2}}{169 \times 768}$$

$$\frac{476 \frac{1}{2}}{169 \times 8} = 32 \frac{1}{4} \text{ sterling.}$$

Ex. 8. Suppose that 1000 sterling is circulated from London to Amsterdam at the price of *exchange* in the preceding examples, viz. at 35 = 24, how many guilders of Holland will this sum purchase? 1000 sterling at 421 1/2 groats Amst. per l. sterling, will purchase 1050 = 10 guilders of Amsterdam, by Ex. 8. These 1050 = 10 guilders, circulated from Amsterdam to Paris, will produce at the arbitrated price of *exchange*, viz. 361 1/4 groats

per French crown, 747 crowns = 1 = 7 1/2 of France; and these crowns drawn home to London, at the above *exchange* of 35 = 24 sterling, per French crown, will produce the same 1000 sterling. Whence it follows that &c. the real price of *exchange*, at the time when these computations are made, is more or less between Amsterdam and Paris than the exact arbitrated price, for example, it may draw home more or less than your 1000 sterling. In illustration of this kind, the *Bill of exchange* will attend the occasion to buy bills of *exchange* where they are cheapest, in order to dispose of them at such place, where, at the first time, they are dearth. See *Bill of exchange*.

EXCHANGE, *Perpetual*, in Commerce, an agreement, whereby one thing is stocked or given for another.

The first commerce carried on among men, was by *exchange*, people furnishing each other mutually with what things they wanted; but such *exchange* was attended with two considerable difficulties, 1. On account of the unequal values of commodities; and 2. Because every body had not full what might accommodate the person with whom he would *exchange*.

To remove these inconveniences, money was invented for a common medium, and instead of *exchange*, buying and selling were introduced.

Yet there are nations among whom the primitive way of *exchange* still obtains; and even among the most civilized people, there are frequent occasions, in which they have recourse to this method. Such, for instance, is the trade of several cities of the North, and Baltic Sea, where the French *exchange* their skins and furs for wool, metals, lamps, and furs.

Two methods of bills of *exchange* is, first, a bill made by *exchange*, a bank of money for money. *Exchange*, therefore, properly denotes the business, or trade of money, as carried on between the place and another, by means of bills of *exchange*, viz. by giving money in one city, and receiving a bill in return the agent to receive the value in another city. See *Bill of exchange*.

There is also another species, called *bill of exchange* common *flow*, or *bank's exchange*, which consists in giving money at one place, to be repaid it, after a certain time, in the same place, with a certain *bank* only, which is usually more than common interest.

The extension of a *bank's exchange* is considered only in fictitious kind, which is only a method of borrowing money. The business consists in a bill of *exchange* on any company period, perhaps at Amsterdam, in one place the *exchange* then goes out, and delivers it to the bank. After the time, which comes a month from Amsterdam for payment, with the remittance the money then comes in London; all which while, besides a deduction perhaps at the making of the bill, the borrower must pay.

EXCHANGE is also said for the profit which a merchant, importer, or broker makes of a sum of money received, and for which a bill of *exchange* is drawn, payable at some other place, and by some other person, for the interest of his money, and the salary and reward of his negotiation. This profit is exceedingly various, being sometimes 2, sometimes 3, 4, or even 10 and 15 per cent, according as the value of the species differs, or as money is more or less plentiful, or bills of *exchange* more or less scarce, in the places. This kind is commonly called *real exchange*, and sometimes *mercantile* or *money exchange*.

The price of *exchange* is regulated according to the supply of the place where the bill is drawn, or that of the place where the remittance is to be made; some pretend that it is the city of Lyons that gives the law, or rules, for the price of *exchange* to most of the other cities of Europe.

The word *exchange*, according to some, is derived from that perpetual alteration observed in the price of this *exchange*, which is sometimes higher and sometimes lower, there being incessant fluctuation to give and sometimes to take thereby, and sometimes willing to be richer, or to be poorer, as it is the case, when the *exchange* is at *prime*. From this diversity in the price of *exchange*, arises this common proverb, *De exchange, et de mal, et de mal*, meaning, But the more natural way of deriving the word *exchange* is from this, that a man has, or expects, his money for a bill; or that he changes his money for another money; or changes his debts.

As money is not to be looked on as a base, from which it differs, because in the end, the *exchange*, or danger, lies on the person who borrows; and in the end, on him who lends. It likewise differs from interest, because *exchange* is not paid in proportion to the time, as interest is.

EXCHANGE is also said in diverse places for the profit allowed for exchanging one sort, or species of money for another.

This is particularly called *bank exchange*, *actual exchange*, *pure exchange*, &c.

EXCHANGE is sometimes also used for the AGIO, or profit allowed for the monies advanced in any one's behalf.

Exchange is a kind of the actual and monetary value of money. Silver as a metal has a value like all other merchandises, and an additional value, as it is capable of becoming the sign of other merchandises. If it was no more than a mere merchandise, it would perhaps lose much of its nominal value. As a money, silver has a value which the prince in some respects can fix, but in others he cannot.

The prince establishes a proportion between a quantity of silver, as metal, and the same quantity, as money. He fixes the proportion between the several metals made use of as money; he establishes the weight and standard of every piece of money; in doing, he gives to every piece that ideal value already spoken of. We shall call the value of money in these two respects, its positive value, because it may be fixed by law.

The coin of every state has, besides this, a relative value as it is compared with the money of other countries. This relative value is established by the *exchange*, and greatly depends on its positive value. It is fixed by the current course of commerce, and by the general opinion and consent of merchants, but never by the decrees of the prince, because it is liable to incessant variations, depending on the accidental circumstances of trade, the money-transactions between nations, and the state of public credit, &c.

The several nations in fixing this relative value, are chiefly guided by that which possesses the greatest quantity of specie. If the has as much specie as all the others together, it is then most proper for the others to regulate theirs by her standard; and this regulation between all the others, will nearly agree with the regulation made with this principal nation.

The relative abundance or scarcity of specie in different countries, forms what is called the course of *exchange*; and this course of *exchange*, depends, not so much on relative, as on absolute quantity of specie. It is not real but relative; e. g. when France has greater occasion for specie in Holland than the Dutch of having funds in France, specie is said to be in demand in France, and scarce in Holland; and vice versa. See *Balance of Trade*.

We may observe, in general, that there is much specie in places where there is more specie than paper; there is little, when there is more paper than specie; and in order to judge of the scarcity or plenty of specie, we must know, for example, that if there are more bills than specie in France, then specie is scarce in France, and common in Holland; and therefore it becomes necessary that the *exchange* should rise, and the Dutch give more for specie of the same value in France, than the French for that of an equivalent value in Holland. When money of the same standard and weight in France yields more in the same standard and weight in Holland, the *exchange* is then said to be *in Paris*. Thus in the year 1744, the rate was nearly at 54 grots in the French crown of three livres; when the *exchange* is above 54 grots, the French would say it is high; when below 54 grots, they say it is low. When the *exchange* is below par between one country and another, the former loses as debtor and buyer, and gains as creditor and seller. Thus if France owes Holland a certain number of grots, the more of these there are in a crown, the more grots she has to pay; and as there must be the same number of grots to buy the same quantity of merchandise, while the *exchange* is low, every French crown is worth fewer grots. On the contrary, if France is creditor for a certain number of grots, the less of them there are in a crown, the more grots she will receive; and if France sells her merchandise in Holland for a certain number of grots, the more grots will the receiver, in proportion as each crown contains fewer of these grots. The same reasoning will apply, *mutatis mutandis*, to the commercial transactions of other countries, and to any pair of *exchange*. It is evident, that a merchant may send his stock into a foreign country, when the *exchange* is below par, without incurring his fortune, because when it returns, he recovers what he had lost; but a prince, who sends only specie into a foreign country, which can never return, is always a loser. When men trade, they have great dealings in one country, they so large their infidelity rises, on account of these numerous transactions, buying great quantities of merchandise, and sending on foreign countries to pay for them. The attraction of *exchange* is an article of great importance in the discussion of this subject; this is a kind of truck, which men bankers or merchants, usually make of their bills upon different parts, at a continual price and course of *exchange*.

In order to understand this branch of commerce, it is necessary to know how to reduce the sterling money of England into the foreign monies of *exchange* and of ac-

count of all places through Europe, according to the direct courses of *exchange* established for their purposes; and *vice versa*; and also those of other places, with which England has no direct established course of *exchange*, but is under the necessity of making use of the intermediate changes of other places. The nature of the art, and the manner of conducting bank monies into current, and the reverse, should likewise be well understood. The method of reducing the foreign monies of Europe into those of every other distant country, according to the direct or intermediate *exchange*, should be thoroughly known; besides, it is necessary to know the intrinsic value of foreign monies, according to the most accurate assays that have been made for that purpose; and also the general natural causes of the rise and fall of the course of *exchange* between one nation and one city, and another; which depend on the balance of trade being either in favour of or against such trading nation or city. By an accurate observation and comparison of the courses of *exchange* between various countries and cities, the merchant will have an opportunity of profit, which should not escape his cognizance. He will find that they seldom ebb and flow in an exact equality of proportion, since the balance of trade differs between different nations. The greatest profit may be made by losing the opportunity of drawing and remitting to certain places *vice versa* to others. Further, when the *exchange* is lower than the price of a country, a profit may be made by sending it abroad; when it is higher, there is a profit in causing it to return; but there is a case in which profit may be made, by sending the specie out of the kingdom, when the *exchange* is at par; that is, by sending it into a foreign country, to be received, when it returns, an advantage may be made of it, whether it be circulated in the country, or paid for foreign bills. See farther on this subject, *Post. Dict. Com. Instit. Arbitration and Exchange*.

EXCHANGE also denotes a public place, in most countries the chief, wherein the merchants, negotiators, agents, bankers, brokers, intertraders, and other persons concerned in commerce, meet, on certain days, and at certain times thereof, to confer, and to transact of matters relating to *exchange*, remittances, payments, advances, assurances, engagements, and other mercantile negotiations both by land and sea.

In *Amsterdam*, *Holland*, and several cities of France, these places are called *Bourses*; at Paris and Lyons, *places de changes*; and in the *Hanse towns*, *alters of merchants*. Their assemblies are held with so much exactness, and merchants and negotiators are so indispensably required to attend at them, that a person's absence alone makes him be suspected of a failure or bankruptcy.

The most considerable *exchange* in Europe, are that of *Amsterdam*; and that of *London*, called the *Royal Exchange*. For an account of the latter, see *ROYAL EXCHANGE*.

The former is a large building, two hundred and thirty feet long, and a hundred and thirty broad, round which runs a portico or portion, twenty feet wide. The columns of the portico, amounting to five or six, are numbered, for the convenience of finding persons. That of *Amsterdam* was little inferior in value of them, till a variety of circumstances occurred to effect its ruin, and to transfer its trade to *Amsterdam*; the ruin of this important event in commercial history is about the year 1485.

Even in the time of the ancient Romans there were places for the merchants to meet, in most of the considerable cities of the empire. That said to have been built at Rome in the year of the city 350, 493 years before our Saviour, under the consulate of Appian Claudius, and Publius Servilius, was called *templum mercatorum*; whereas it is pretended there are still some remains, called by the modern Romans *regia*, the *reges*; and now, usually, the *Place of St. George*.

This notion of a Roman *exchange* is supposed to be founded on the authority of Livy, whose words are as follows, viz. *Cervius instituit templum, ubi adesset Mercatorum alium*. *Verum si se res ad templum transiit, non delictum aliquod, sed ad templum, ubi, ut Liv. lib. 3. But it must be here remarked, that *templum* never signified a building for a society in the power of the Latin tongue; so that *templum mercatorum* signifies nothing but a rendered to build an *exchange* for the merchants, but to incorporate the merchants into a company. As Mercury was the god of traffic, this *templum* seems to have been chiefly designed for the deities of this company or corporation.*

EXCHANGE, in *Law*, is a mutual grant of equal interest in lands or tenements, the use in *exchange* for the others; and in our common law it more particularly denotes the com-

comprised in which the warehouse will make the warehouse value for sale, if the land warehouse be recovered from the warehouse. *Statute lib. ii. See Warehouse.*

EXCHANGERS, the King's, is the place appointed by the king for the exchange of money, or any other for the king's coin.

There were two formerly here (London) but now there is only one, viz. that at the Tower of London, joined with the Mint.

EXCHANGE, bill of. See *BILL OF EXCHANGE*.

What are called *exchange* is the duty, or premium of a foreign exchange, when a bill is procured. See *RE-EXCHANGE*.

EXCHANGEABLES, are persons who make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to assist to those who have money to receive or give beyond sea, who are proper persons for exchange or any other business.

EXCHANGERS are those who receive money beyond sea, by bills of exchange, &c. called *exchange* also *exchangeers*, and *interchange*.

EXCHIQUEUR, or simply *CHANGERS*, originally denotes a Chief officer, or a frame divided into two divisions, of two columns, wherein in play at draughts, chess, &c. See *CHANG*, &c.

The word is formed from the French *exchanger*, which signifies to exchange. Hence, trees are said to be planted *exchangably*, in *perpetuum*, when disposed for to form directly figures representing a figure.

EXCHIQUEUR is more particularly used for a chamber, or apartment, in Westminster-hall, consisting of two parts: the court of *exchequer* and the *water-chamber*. See *COURT OF EXCHEQUER*.

EXCHANGEABLES are a species of paper first established by Mr. Montague, in 1695, to supply the want of circulating cash, during the re-colourage at that period. They were then taken at the *exchequer* for all payments of the revenue, and, when required, they were allowed 7½ per cent. interest. They have since been issued yearly, and the bank of England, ever since the year 1706, have been the contractors for their circulation, at a certain premium. The commissioners of the treasury are empowered, by various statutes, to borrow money, within a specific sum, limited by those statutes, by issuing exchange bills on the credit of certain duties, which bills, by 13 Anne, cap. 11, §. 12 Geo. I. cap. 11, bear an interest of 3½, 2 day per cent. payable to the bearers. These bills are numbered arithmetically, and ingrossed accordingly, so that the principal sum may be paid off in court, and the interest shall be payable every three months. The said exchange bills shall be current to all receivers and collectors of the customs, excise, or any revenue, and at the receipt of the *exchequer*, and as any of these are paid or lent into the *exchequer*, the officers there shall cause entries to be made and delivered to the payers or lenders, as if they had made such payments or loans in specie. If any *exchequer* bill be lost, upon affidavit before a *baron* of the *exchequer*, and certificate from him, and security given to pay the same if found, duplicates are to be made out; and when bills are defaced, new ones shall be delivered. Forgery of these bills, or of the indentments on them, is felony.

EXCHIQUEUR, register of the. See *MILITARY*.

EXCHIQUEUR, Black Book of the, is a book under the keeping of the two chamberlains of the *exchequer*; said to have been compiled in 1175, by Gervais of Tilbury, nephew of king Henry II. and divided into several chapters.

Herein is contained a description of the court of England, as it then stood, its officers, their ranks, privileges, wages, responsibilities, power, and jurisdiction; and the revenues of the crown, both in money, grain, and cattle. Here we find, that for one bushel, as much bread might be bought as would feed a hundred men a whole day; that the price of a full boll was only twelve shillings, and a sheep, four, &c. *Luttrell, p. 6, p. 334.* See also *DEBENTURY*.

EXCHIQUEUR, in Pharmacy, a term used to express that ingredient in a compound medicine, the business of which is to receive all the rest; such is the confederate in electricity, the *tray* in botany, &c.

EXCISE, a duty, or imposition, charged on beer, ale, cyder, liquors made by law, and other commodities, within the kingdom of Great Britain, and town of Berwick upon Tweed.

The duty of *excise*, as well as the term, was first introduced in 1713, and afterwards granted to king Charles II. by act of parliament. In the year 1766, during the life of that prince, it has since been continued and augmented by diverse parliament, under the several succeeding princes, and extended to Scotland.

The several commodities that are liable to the duty of *excise*, are ale, beer, cyder, perry, mum, mead, gin,

mead, sweets, verjuice, vinegar, candles, coaches, coffee, tea, and chocolate; glass, hops, leather, linen-cloth, silks and cottons; malt, paper, plate, salt, soap, spirituous liquors, starch, and hair-powder, and wire. (See the several articles).

Besides the particular duties, there are three additional duties of 5 per cent. on all distilled and excised goods, except candles, soap, malt, beer, and hides or skins. &c. by 10 G. III. c. 25. 21 G. III. c. 17. and 25 G. III. c. 66.

The *excise* is one of the most considerable branches of the king's revenue. The amount of the *excise* in England, including the malt-duties, estimated at a medium of three years, ending in 1773, was 4,640,893 £. and the expense of collecting, being the average of the years 1767 and 1768, when their produce was 4,531,075 £. per ann. 6 per cent. of the gross produce, or 267,887 £. and in Scotland, estimated in the same manner, 952,296 £. and the expense of collecting, being the medium of 1772 and 1773, and the difference between the gross and net produce, 31 per cent. of the gross produce, or 472,542 £. It was formerly farmed out, but is now managed for the king by nine commissioners, in England, who fit in the *general exchequer*, receive the whole product of the *excise* of beer, ale, and other liquors, and malt, collected all over England, and pay it into the *EXCHEQUER*.

Their salary is 10000 £. per annum each, and they are obliged by oath, to take no fee, or reward, but from the king only. From the commissioners of *excise* there lies an appeal to four others, called *commissioners of appeals*. The commissioners of *excise* in Scotland are five, and each has a salary of 5000 £. per annum.

The number of officers employed in this branch of the revenue, is very great. Beside the commissioners above mentioned, and their subordinate officers, as *registers*, *messengers*, &c. there is an auditor of the *excise*, and an auditor of hides, with their clerks, &c. A *comptroller* of *excise*, and another of accounts, with their clerks; a *register*, *secretary*, *clerk*, *receiver-general*, with his clerks; *clerk of leases*; *store-keeper*, *house-keeper*, *door-keepers*; *general accompanys*, with their assistants; *accountants for fines*, and two accounts for the London brewery; *clerk of the bills of exchange*; *examining*; *clerk for supervisors districts*; *five general surveyors*; *general surveyors of distillery and brandy*; *examining of the distillery*; of the brewery, and of soap and candles; *surveyors of glass*, of coaches, and plate; *ferriers*; *inspectors of spirituous liquors*, *licences*, and coaches; *inspectors general of coffee*, *tea*, &c. and of brewery through England and Wales. Beside which, there are in England and Wales, exclusive of the bills of mortality, forty-nine collectors, who go their respective rounds once in six weeks; the province of a collector comprehends several districts, within each of which there is a supervisor, under the inspection of the collector; and each district is parcelled out into *outside* and *foot-walks*, within each of which there is an inferior officer, constituted under the hands and seals of the commissioners, or sub-commissioners, in their respective divisions, as necessary requires, and called *gauger*, or *excise-man*, under the inspection of the supervisor, who every six weeks draws out a diary of every day's business, with remarks, and transmits it to the chief officer. Every person, previous to his appointment to the office of *gauger*, must procure a certificate of his age, which must be between twentyone and thirty; he must understand the four first rules of arithmetic, be of the communion of the church of England, and, if married, not have more than two children; he must nominate two able persons (to be his sureties) and the certificates, containing these particulars, and written by himself, must be signed by the supervisor of the district where he lives, and accompanied with an affidavit, that he has no bills for obtaining this office. He is then ordered for instruction, under the care of an experienced officer, and to wait till a vacancy happens. Upon admission of officers of every kind relating to the *excise*, the *oaths* of allegiance and supremacy, and an oath of faithfulness in the execution of the particular office, must be taken; and the declaration against transubstantiation must be subscribed. Officers of *excise*, taking a bribe, are liable to a forfeiture of 100 £. 12 Car. II. cap. 11. and a person liable to *excise* duties, assisting them a bribe, &c. shall forfeit 500 £. 11 Geo. cap. 30. Officers meddling in elections are subject to a penalty of 1000 £. and an incapacity of holding any office under the king. 5 W. cap. 27. The concealment of excisable goods is subject to a forfeiture of three goods, and treble value. 11 Geo. cap. 30. Any person obstructing an officer in the execution of his duty, shall forfeit 100 £. 6 Geo. cap. 24. And an officer, either of the *excise* or *customs*, desisting in excisable liquors, shall forfeit 500 £. and be incapable of any office in the revenue. 21 Geo. cap. 28.

ently the practice only to *excommunicate* such as had killed an ecclesiastic; whereas they were put to death who had killed a layman. But the reason was, they held *excommunication* a greater punishment than death.

The causes with which the concept of the bishop's court, heresy, neglect of coming to church, and of receiving the sacraments, incontinency, adultery, simony, &c. We have instances of bishops, who have pronounced formal *excommunications* against ecclesiastics, and other inferiors, after a formal juridical process against them, wherein those animals were allowed an advocate, and proctor, to defend their cause. See *EXCOMMUNICATIO*.

Ferre relates divers instances of such *excommunications* against rats, mice, and other animals, for infesting a country. See the form of these *excommunications* in that author, *Traité de l'Aloué*.

In the ancient church there were two different kinds of *excommunication* in use; the one called *medicinal*, whereby persons consisted of a crime by their own confession, were removed from communion; the other, called *medicinal*, was fulminated against rebels, who persisted obstinately in their errors and impieties.

The power of *excommunication* was lodged in the whole church in general; that is, the bishops and priests had the administration thereof; by and with the consent of the people, which was practised even in St. Cyprian's time. But afterwards they ceased to consult the people about the matter; the bishop and clergy arrogated the whole power to themselves. Reussets, however, might still be had to a synod of the province, to judge of the validity of an *excommunication*.

EXCOMMUNICATIO, was also practised among the Jews, who used to excommunicate their synagogue such as had committed any grievous crime. See the Gospel according to St. John, ix. 22. xi. 43. xvi. 2. And Joseph. Antiq. Jud. lib. ix. cap. 12. and lib. xvi. cap. 2.

The *Excommunicatus*, when *excommunicatus*, did not so much as receive food at any person's hand, for fear of violating their oath; but contented themselves to live on herbs, and insects that they might not be perished, and died for want. See *EXCOMMUNICATIO* in the Gloss.

Godfrey, in his *Mystic*, and Arey, distinguishes three degrees, or kinds, of *excommunication* among the Jews. The first is found in St. John ix. 22. The second in St. Paul, Epist. i. Cor. v. 5. And the third, in the 1st Ep. to Corinth. xvi. 22. See *EXCOMMUNICATIO*.

The rule of the Benedictines gives the name *excommunication* to the being excluded from the oratory, and the common table of the house, in any kind of excommunicated *excommunicatus*. This was the punishment of such monks as came too late.

EXCOMMUNICATIO, or being secluded, or cut off from a participation in the mysteries of religion, was also in use under paganism.

Such as were thus *excommunicated* were forbidden to assist or attend at the sacrifices, or to enter within the temples; and were afterwards delivered out to the demons and furies of hell, with certain imprecations; which was called among the Romans, *excommunicatio*. See *EXCOMMUNICATIO*.

The Druids, among the ancient Britons and Gauls, likewise made use of *excommunication* against rebels; and interdicted the communion of their mysteries to such as refused to acquiesce in their decisions. See *EXCOMMUNICATIO*.

That this is the true origin of the extensive and hostile influence of the European and papal *excommunication*, will appear evident by the following passage of Caesar, De Bello Gallico, lib. vi. cap. 17. *Si quis aut priores vel publici Delatorum daretur vel fletu, sacrificiis interdictum. Hoc fano apud eos est gravissimum. Quibus si est interdictum, in omnes impiorum et sacrilegiorum habitus, in omnes dardat, ad omnia verum ferunturque delictis, et quid ex religione interdictum est, quod si peritibus per reddere, tunc hunc velat communicat.*

EXCOMMUNICATIO *Copulatio*, or *Significatio*, a writ directed to the sheriff, for the apprehension of one who stands obstinately *excommunicated* the space of forty days. Such a one, not seeking absolution, hath, or may have, his contempt carried into the clancour; whence this writ issues for laying him up, without bail or mainprise, until he conform himself.

EXCOMMUNICATIO *Discretio*, is a writ directed to the sheriff for the delivery of an *excommunicated* person out of prison, upon certificate of the ordinary of his conformity to the ecclesiastical jurisdiction.

EXCOMMUNICATIO *Reussetio*, is a writ whereby persons *excommunicated*, being for their obliquity committed to prison, and unlawfully delivered from thence before they have given security to obey the authority of the church, are committed to be sought for, and laid up again.

EXCORIATION, in *Medicine* and *Surgery*, the passing or rubbing off of the cuticle; especially of the parts between the thighs, or about the anus.

In adults, it is occasioned by riding, much walking, or other vehement exercise, and may be cured by voluntary applications.

In children, there is often an *excoriation* of the parts near the pudenda, chiefly of the groin and scrotum, but likewise in the wrinkles of the neck, under the arms, and in other places, proceeding from the acrimony of the urine and sweat, and occasioning itching pains, crying, scratching, and restlessness.

To remedy this, the parts affected may be washed often with warm water, and sprinkled with astringent powders, as chalk, hartshorn, but especially tuty, lapis calaminaris, and ceruse; which may be tied loosely in a rag, and the powder shook out on the disordered place. If the parts tend to a real ulceration, it will be proper to add a little sugar of lead to the powder, or to anoint the place with unguent alb. camphor. Likewise a little virrid dissolved in spring water, and dabbed upon the part, will dry and heal it very powerfully.

We also say, an *excoriation* in the throat, &c. when the membrane that covers it, or lincia it, is torn by the acrimony of a humour, a medicine, or the fire; which is ordinarily the case in what we call a *fire throat*.

EXCORIATION, the act of stripping off the cortex, or bark, from anything; called also *EXCORIATION*.

EXCREMENT, that which is evacuated, or voided, out of the body of an animal, after digestion; being what in other respects is superfluous and prejudicial thereto. See *EXCRETION*.

Excrement is all that matter taken in by way of food, which cannot be assimilated; and which, of consequence, not growing or adhering to the body, wanders about through the laxer, and more porous parts thereof, till it be ejected.

The urine and faeces, or faecal matter, are the great *excrements*, expelled from the bladder, and the intestines, by stool, &c.

The matter of insensible perspiration is also an *excrement*, and a more considerable one than either of the others. Among *excrement* are likewise ordinarily ranked divers humours and matters, separated from the blood by the several filters, or excretories of the body, though far from being useless, but serving several valuable purposes of the economy. Such are the crumen, or ear-wax; the mucus of the nose; the tears, or lachrymæ; saliva, bile, lymphæ, mucus, lochia, &c. See *EXCRETION*, *Mucus*, *Tears*, *Saliva*, *Bile*, *Mucus*, &c.

Unless the *excrements* are regular, health cannot be maintained; and therefore if they are too plentiful, excessive, or suppressed, they will occasion various disorders. Hence if a person be robust, it is generally the fortune of some disease. As a man generally takes more aliment than is necessary to generate blood and serum, and the common *excrements* are not sufficient to carry off superfluous humours, extraordinary ones sometimes happen at stated times; as the piles, hemorrhages, &c.

EXCREMENT is also attributed, by way of analogy to plants. Thus gums, divers juices, balsams, &c. issuing spontaneously from their respective trees, are sometimes called *excrements*.

EXCRESCENCE, in *Surgery, denotes superfluous, or luxuriant flesh, or other matter, growing on certain parts of the bodies of animals, contrary to, or beyond the ordinary structure, and disposition of nature.*

The word is formed of the Latin *ex*, and *crevere*, I grow; q. d. something that grows from, or out of another. Such are warts, wens, cancers, polypus, &c.

Natural, or customary *excrements*, as the teeth of bones, &c. are called by physicians *excreta*.

EXCRETION, formed of *ex* and *creo*, is *separatio*, in *Medicine*, the act of expelling or ejecting out of the body some humour that is useless or even harmful thereto.

Most excreta are effected by *arteries*, as fluxes of blood and urine, sweat, vomitings, loose stools, &c.

EXCRETORY, in *Anatomy*, is applied to certain limbs ducts, or vessels, in the fabric of the glands.

Excretory ducts are the tubes through which the humours, separated in the several glands, are emitted, or discharged out of the glands, into some immediate receptacle, or conduit.

A capillary artery, to which a capillary vein is joined, with an *excretory duct*, considered, or bound together, make up the body of the gland, the organ of secretion. The *excretory ducts* spring from the extremities of the arteries and vein, and carry off a liquor separated from the blood. *Drake*.

The lymphatic glands have either *symplic ducts* for their *excretory ducts*, or lateral ducts, as in the mesentery. *Idem*.

EXCURSION, in *Astronomy*. See *EXPLANATION*.

EXCURSION, in *Church History*, a term used to denote slaves, who flying to any church for sanctuary, were ex-

elled and pardoned by their masters; but these were obliged to take an oath to that purpose before they could have them again; and, if they broke the oath, they were punished and fined as persons guilty of perjury.

EXECUTIA *centurio*, the *struch-bearer*, a name given, by modern surgeons, to an instrument made of soft huddles, forged into a handle, and fixed upon a flexible brass wire, for clearing the throat, or even the stomach. The *stomach-brush* is composed of soft hair, fastened together by a handle by a twisted brass or steel wire, and the handle or stem of it is involved with silk. This has been greatly recommended, by some, to remove foreign bodies out of the fauces and oesophagus, and to scour the stomach. The method of using it is this.

The patient is first to drink a small draught of warm water, then the brush is to be received into the oesophagus, and gently protruded down into the stomach, by twisting round and round its handle, and, when in the stomach, it is to be drawn up and down many times, like the fuzzer in a syringe, and at length wholly extracted. The advantages said to arise from this are very great, such as the prolonging life to a great age, and the like; but few people have been willing to try the effects of so disagreeable and troublesome an operation. Wedelius and Leichmeir have written express treatises on this instrument; and one of them has attempted to prove it no new contrivance, but a thing very early known, described, and used in physic. Heister's Surgery, part ii. p. 2.

EXECUTE, in *Church Discipline*, a Latin term, used for a permission, which a bishop grants a priest to go out of his diocese; or an abbot, to a religious, to go out of his monastery.

The word is also used in several great schools for leave given a scholar, or student, to go out. His master has given him an *exeat*.

EXECRATION, *Execratio*, among the *Societis*, a kind of punishment, consisting of dismal curses and marks of infamy. Lary grants an instance of it, which was used against Philip, king of Macedon, by the Athenians. A general assembly of the people being called, they made a decree, that all the streets and images of the king, and of all his ancestors, both of the male and female sex, should be demolished, and their very names taken; that all the festivals, sacred rites, priests, and whatever else had been instituted in honour of him, should be profaned; that the very places, where there had been any monument or inscription to his honour, should be detestable, and that nothing should be set up, or dedicated in them, which could be done in clean places; and, lastly, that the public priests, as often as they prayed for the Athenian people, allies, armies, and fleets, should as many times detest and execrate Philip, his children, kingdom, land and sea forces, and the whole race and name of the Macedonians. Cornelius Nepos, in his Life of Alcibiades, calls it *detestatio*.

At the taking and demolishing of a city, it was frequent to pronounce dismal curses and execrations upon any person who should endeavour to rebuild it; which some imagine was the reason that Troy could never be raised out of its ashes, though several persons attempted it, being devoted to eternal and irreparable ruin by Agamemnon. This seems to have been a very ancient custom, and derived from the eastern nations; for we find Julius, at the destruction of Jericho, to have fixed an imprecation upon the person who should rebuild it, which was thought to be accomplished in Him the Redeemer many ages after. Potter, Archæol. tom. ii. p. 77.

EXECUTION *facti*. See *FACTI*.

EXECUTION, the act of executing, i. e. of accomplishing, finishing, or achieving any thing, to be done.

We say, the *execution* of a testament: of a law; of a treaty; of a building, or the like.

EXECUTION is particularly used, in the French *Mois*, for the manner of finishing, or of the performance of a song. As to the manner of singing, called in France *execution*, no nation may, with any probability, dispute it with the French. If the French, by their commerce with the Italians, have gained a colder composition, the Italians have made their advantage of the French, in learning of them a more polite, moving, and exquisite *execution*. See *Eventement*.

EXECUTION, in *Common Law*, signifies the last performance of an act, as of a writ, a judgment, or the like.

EXECUTION of a judgment, is the obtaining of the possession of any thing recovered by judgment of law.

There are two sorts of *executiones*, one *final*, another with a *quasi*, or only tending to an end.

EXECUTION, *final*, is that which maketh money of the defendant's goods, or extendeth his lands, and delivers them to the plaintiff; for this the party accepts in satisfaction; and this is the end of the suit, and all that the king's writ commands to be done.

EXECUTION with a *quasi*, is that which only extends to an end; as in the case of a writ of *assumpsit*, &c. This is not final; but the body of the party is to be taken, to the intent and purpose to satisfy the plaintiff; and his imprisonment is not absolute, but till he doth satisfy, so that the body is but a pledge for the debt.

Executiones are either in personal, real, or mixed actions. In a personal action, the *execution* may be made three ways; viz. by the writ of *CAPIAS ad satisfaciendum* against the body of the defendant; *FIAT FACS*, against his goods; or *EXECUTIO* against his lands. In a real and mixed action, the *execution* is by writ of *HABERE FACS possessionem*, and *habere facs possessionem*.

EXECUTION, *tenent* by. See *TENANT*.

EXECUTION, *military*, is the pillage or plundering of a country by the enemies army.

EXECUTION, *military*, also denotes every kind of punishment inflicted on an army by sentence of a court martial. This is of various kinds; as tying up to three halberds, and receiving a number of lashes with a whip, composed of nine cord-lashes, and each lash of nine knots, from the drummer; or running the gantlope through the parade at guard-mounting, drawn up in two lines for that purpose. On this occasion the provost marches through with twigs or switches, and every soldier takes as many as there are criminals to be punished; the criminal then marches through the two lines, and each soldier giving him a hard stroke, the major riding up and down to see that the men lay on properly. When a soldier is to be punished with death, a detachment of about two hundred men from the regiment to which he belongs forms the parade, and a file of grenadiers flanks the prisoner to death.

EXECUTION of criminals must be according to judgment; and the king cannot alter the judgment from hanging to beheading, because no *execution* can be warranted, unless it be pursuant to the judgment. 3 Inst. 271. H. P. C. 252. But there are ancient precedents wherein men condemned to be hanged for felony, have been beheaded by force of a special warrant from the king. Bract. 104. Staunf. 13. And the king may pardon part of the *execution* in judgment for treason, viz. all but beheading. The court may command *execution* to be done without any writ; though formerly *execution* is commanded by writ. 2 Hawk. P. C. 263. Judgment belongs to the judge; but the *execution* must be done by the sheriff, &c. and an *execution* cannot be lawfully made by any but the proper officer; who may do it by the precept of the judge under his seal; and if the sheriff, or other officer, alters the *execution*, or any other executes the offender, or if he is killed without the authority of law, it is felony. 2 Hawk. ib.

In case a man, condemned to die, come to life after he is hanged, as the judgment is not executed till he is dead, he ought to be hung up again. Finch, 389. The body of a traitor, or felon, is forfeited to the king by the *execution*.

EXECUTIONE facti, a writ commanding execution of a judgment.

EXECUTIONE facti in *utrumque*, lies for taking the cattle of one who had formerly conveyed out of the county the cattle of another.

EXECUTIONE facti, in *Law*, a writ directed to the judge of an inferior court, to do *execution* upon a judgment therein, or to return some reasonable cause wherefore he delays the *execution*. F. N. B. 20.

Execution be not done on the writ *return*, in *all* still *issue*, and a *quarry*, with this clause, *et causam non finemur quare*, &c. And if, upon this writ, *execution* be not done, or some reasonable cause returned why it is delayed, the party shall have an attachment against him who ought to have done the *execution*, returnable in B. R. or C. B. New Nat. Br. 43.

EXECUTIVE power, *supreme*, is by the constitution of these Kingdoms lodged in a single person, the king or queen, for the time being. See *CHRON*.

EXECUTOR, a person nominated by a testator, to take care to see his will and testament executed or performed, and his effects disposed of according to the tenor of the will.

The testaments made in Latin in the fourteenth century, call executors, *procuratores testamentarii*.

All persons are capable of being executors, that are capable of making wills, and others besides, as *forescutors* and infants, and infants unborn; but no infant can act, as *executor*, till he is seventeen years of age. This appointment of an *executor*, either by express words, or by such as strongly imply the same, is essential to the making of a will; but if the testator names no *executors*, or names incapable persons, or if the *executors* that are named refuse to act, the ordinary must grant letters of administration. See *ADMINISTRATOR*.

A person appointed to be *executor* is not compellable to execute

execute the will; he may refuse the charge, before he be administered to, or perform such acts, as paying debts due by the testator, or receiving debts due to him, or giving acquittances for the same; but if he meddles with the goods of the testator, as executor, his subsequent refusal is void, and he shall be charged as executor. A person to whom a legacy is left may be compelled either to stand the executorship, or to resign his legacy. The refusal of executorship must be entered and recorded in court. If several executors are named in a will, and none of them reside, and others prove the will, they who reside may afterwards administer and act; and they shall be joined in all suits, where the executors are plaintiffs, but not where they are defendants, because the plaintiff in the action is not bound by law to take notice of any besides those who have proved the will.

As to the office or duty of an executor, it is to be observed that he may do many things before he proves the will, which an administrator cannot do; because the former derives his power from the will, and not from the probate, or appointment of the ordinary, as the latter does. He may maintain actions of trespass, replevin, or detinue; release an action, assent to a legacy, be sued, alien, or otherwise intermeddle with the goods of the testator by administering. The executor is entitled to receive all debts due to the testator, and all payments made to him are good, though he should die, and never prove the will; but he cannot maintain a suit or action of debt, or the like, before he has proved the will. The ordinary, &c. may cite the executor, either to prove the will, or to refuse the office; and he may sequester the goods of the deceased, till the executor has proved it; and if he does not appear on the process, the ordinary may excommunicate him. On the other hand, the ordinary is compellable by mandamus to proceed to probate, when the will is not controverted. The executor must bury the deceased in a manner suitable to the estate he leaves behind him; necessary funeral expenses are allowed, previous to all other debts and charges; but if he be extravagant, he is chargeable with devastation, or waste of the substance of the deceased, which shall be only prejudicial to himself, and not to the creditors or legatees of the deceased. He is then to make an inventory of all the goods and chattels, whether in possession or action of the deceased, which he is to deliver in to the ordinary upon oath, if lawfully required, at the time of probate. He is then to collect all the goods and chattels so interdicted; for which purpose the law confers on him ample powers, as the representative of the deceased; and having the same property in his goods as the principal had when living, and the same remedies to recover them; and if there be two or more executors, a sale or release by one of them shall be good against all the rest. The executor must in the next place pay the debts of the deceased, in the order of their priority. See DEBTS, and DEBTS executor.

If no suit is commenced against him, the executor may pay any one creditor in equal degree his whole debt though he has nothing left for the rest; for, without a suit commenced, the executor has no legal notice of the debt. After the debts, the executor is to pay the legacies, which he is to pay as far as his assets will extend; but he may not give himself the preference herein, as in the case of debts. In case of a deficiency of assets, all the general legacies must abate proportionally, in order to pay the debts; but a specific legacy, as of a piece of plate, house, &c. is not to abate at all, unless there be not sufficient without it. If the legatees have been paid their legacies, and debts come in more than enough to exhaust the residuum, they are afterward bound to refund a ratable part. See LEGACY, and DONATION causa mortis.

When all the debts and legacies are discharged, the surplus or residuum must be paid to the residuary LEGATEE, if any be appointed by the will; if there be none, it was formerly understood to belong to the executor; but it seems to be now the general opinion, that, if there be an express legacy given to an executor, and no devise of the surplus, such surplus shall not go to the executor, but be disposed to the next of kin, according to the statute of distributions; the executor standing on the same footing as an ADMINISTRATOR. See INTERSTATE.

Where no express legacy is given to the executor, the surplus shall go to the executor, if not otherwise disposed of by WILL. When there are several executors, and some of them are dead, the legatee must sue the surviving executor, and not the executor or administrators of those that are dead. And if all the executors are dead, he must sue the executor or administrators of those that died last, and not those of the first.

By the French law, an executor should be sued of all the

movables of the deceased during one year; at the end whereof he is to account for them. As to the validity of a testament, it is not necessary there be an executor nominated therein.

EXECUTOR *de facto*, or of his own wrong, is he who takes on him the office of an executor by intrusion, not being constituted thereby by the testator, or deceased, nor authorised by the ordinary to administer.

If an executor in his own wrong takes upon himself the office of an executor without lawful authority, he is chargeable to the rightful executor, and to all the creditors of the testator, and likewise to the legatees, so far as the goods amounted to, which he wrongfully possessed; and such an executor is made by any act of acquisition, transferring, or pawning himself of any of the estate or goods of the deceased; but not by acts of necessity, pity, or charity. 2 Nelson 386-793. Such an executor cannot bring an action in right of the deceased; neither can he retain for his own debt or legacy. In case of his death, his executor or administrators are liable to the suit of the lawful executor, creditors, and legatees, by 30 Car. II. c. 7.

EXECUTOR, *Dilecti*. See DEUTER.

EXECUTORY, that which has, or carries with it a sufficient authority for being executed.

A contract is only executory, when it is in form, and sealed; the great seal of England is executory throughout the whole island.

EXECUTORY devise, is where a future interest is devised, that vests not at the death of the testator, but depends on some contingency which must happen before it can vest. Thus, if a particular estate is limited, and the inheritance passed out of the donor, this is a CONTINGENT remainder; but where the fee by a devise is vested in any person, and to be vested in another upon contingency, this is an executory devise. And in all cases of executory devises, the estates descend until the contingencies happen.

EXECUTORY will is an estate in fee, created by deed or will, which is to be afterwards executed by curry, delivery, writ, or the like; and estates executed are those which pass presently to the person to whom they are executed, without any subsequent act.

EXECUTORY fee. See FEE.

EXECUTES, *horii*. See HORII.

EXECUTOR, *Academy*, among the *Animæ*, were places wherein the philosophers, sophists, rhetors, &c. used to hold their conferences and disputes.

M. Perin is of opinion, the *Academy* were a sort of little academies, where the men of learning met together. See ACADEMY.

Budæus rather thinks, that what the ancients called *Academy*, might answer to what we call *cloisters* in the cloister of monks, or collegiate churches.

EXEGESIS, *Exegesis*, a term sometimes used by the learned, to signify *explication*.

Several interpreters of the Bible are of opinion, that in the passages of Scripture, where we meet with *Abba* Pater, two words, the first Syriac, and the second Greek or Latin, but both signifying the same thing; the second is only an *exegesis*, or explanation of the first.

EXORDIUM is also used for an entire discourse by way of explication, or comment, on any thing.

EXORDIUM *numeral*, or *ordinis*, signifies the numeral, or literal solution, or extraction of roots, out of affected equations, first invented by Vieta. Ozanam calls it *in rhymis*. See EXTRACTION of roots.

EXEGESSES, termed of *Christians*, I explain, among the Athenians, persons learned in the laws whom the judges used to consult in capital causes.

EXEGETICA, in *Astronomia*, the art of finding, either in numbers or lines, the roots of the equation of a problem according as the problem is either numerical, or geometrical. See ROOT, and EQUATION.

EXEMPLAR, a MODEL, or original, to be imitated, or copied.

EXEMPLAR also denotes the idea, or image, conceived, or formed in the mind of the artist, whereby he conducts his work. Such is the idea of Cæsar, which a painter has in his mind when he goes to make a picture of Cæsar.

The exemplar is ordinarily numbered among the cresces. See CAUSE.

EXEMPLIFICATION of letters patent, denotes an exemplar, or copy of letters patent, made from the instrument thereof, and sealed with the great seal of England.

Such exemplifications are as effectual to be viewed, or pleaded, as the letters patent themselves.

EXEMPLIFICATIONE, in Law, is a writ granted for the exemplification of an original record. Reg. Orig. 290.

EXEMPTION, a privilege or dispensation, whereby a person is excepted out of some general rule.

Exemption is particularly applied to churches, chapels, and monasteries, which have a privilege given them by the pope, or prince, whereby they are exempted from the jurisdiction of the bishop, or ordinary.

The council of Constance revoked all *exemption*, to restore to the general law weakened and diminished by a relaxation of several ages, its ancient force and vigour, and make it every where obtain in all its latitude.

The council of Trent prohibited and declared them null for the future: confirming only such as were well founded on legal concession from the holy see.

EXEMPTION, in Law, denotes a privilege to be free from service or appearance; that, knights, clergymen, &c. are exempted from appearing at the county courts by statute, and peers from serving on inquests. Persons between years of age, apothecaries, &c. are also exempted by law from serving on juries, and justices of peace, attorneys, &c. from public offices.

EXERCISE, a repetition of any operation for the strengthening or retaining of a habit.

Thus we use *exercise* of the body for acquiring, or maintaining health; as it conduces both to the expulsion of the excrement, and preserving the tone and spring of the fluids.

People who live a sedentary life, and do not use *exercise*, are liable to an universal relaxation of the fluids, which brings on other disorders, as indolence, obstructions, weak nerves, and defect of perspiration. Causes of hazard are to be discountenanced, and those of *exercise* to be promoted.

Exercise is of other make one of the physicians recommendations. See GYMNASIUM.

Labour, or *exercise*, Dr. Cullen observes, is indispensably necessary to preserve the body any time in due pliability. Labour may be pursued, however assisted, both in quantity and quality; for whatever exertions be used to induce the motion, or any succedaneum be provided to prevent the fatigue. Still our bodies are for motion, and the annual economy is so contrived, that, without due labour and *exercise*, the blood will thicken, the joints will stiffen, the nerves will grow lax, and, from these disorders, chronic diseases, and a crazy old age, must ensue. Essay on Health, p. 92.

Of all the *exercise* that we, or may be, used for health, as walking, riding on horseback, or in a coach, fencing, dancing, bowling, digging, pumping, sitting, &c. walking is the most natural, and would be the most useful, if it did not spend too much of the spirits of the wealthy. But riding is certainly the most manly, the most healthy, and is less laborious and expensive of spirits than any.

It is generally said that riding is a more healthful *exercise* than walking; which appears to be an assertion a little too general; for walking is much more effectual in promoting an increase of muscular strength, and in imparting to the fibres a due elasticity, than riding. But where any of the *exercise* are much obstructed, and a patient is too weak to support sufficient walking *exercise*, in such cases riding may be more beneficial. Upon the whole it may be said, that walking is best for the preservation of health, but riding for the relief of chronic disorders; for in those which are acute, neither of them is advisable.

Those organs of the body that are most used, always become flaccid; so that we may strengthen any weak organ by *exercise*. Thus, the legs, thighs, and feet of children; the arms and hands of watermen; the backs and shoulders of porters, crew, drunks, and brayers, by time and use. It is *exercise*, also, that speaking strong, and loud will strengthen the voice, and give force to the lungs. To the ultimate, therefore, and those of weak lungs, I would recommend, says Dr. Cullen, talking much, and loud; walking up easy ascents, &c. to those of weak horses, and weak men, riding on horseback; to those troubled with the stone, riding over rough excursions in a coach; to those troubled with rheumatic pains, playing at billiards, crickets, or tennis; to those of weak arms, or hands, playing at tennis, or foot-ball; to those of weak backs, or breasts, ringing a bell, or working at the pump. Walking through rough roads, even to lassitude, will recover the use of the limbs to the gouty; though riding will best prevent the disease. But the studious, the contemplative, the sedentary, and those of weak nerves, must make *exercise* a part of their regimen. A condition necessary to render *exercise* as beneficial as may be, is that it be used on an empty stomach. Under the head of *exercise*, cold bathing, and the fresh-air bath come also to be recommended. Medical p. 103, 104, &c.

Proper *exercise* conduces much to the health of soldiers in camp.

The *exercise* of a soldier may be considered under three heads; the first relating to his duty, the second to his

living more commodiously, and the third to his diversions.

The first, consisting chiefly in the *exercise* of his arms, will be no less the means of preserving health, than of making him expert in his duty; and frequent returns of this *exercise*, and before the sun grows low, will be made more advantageous than repeating it seldom, and laying too long out at a time; for a camp soldier, little convenience for refreshment, all unnecessary fatigue is to be avoided.

As to the second article, cutting, bought for finding the tents, making treuchas round them for carrying off the water, sing the straw, cleaning their cloaths and accoutrements, and sitting in the beluins of the tents, ought to be no disagreeable *exercise* to the men for some part of the day.

Lastly, as to diversions, the men must be encouraged to them, either by the example of their officers, or by small premiums to those who shall excel in any kind of sports, as shall be judged most conducive to health; but herein great caution is necessary, not to allow them to fatigue themselves too much, especially in hot weather, or sickly times; and above all, that their drinks be kept dry, wet cloaths being the most frequent cause of camp diseases.

Exercise, in the Art of War, denotes the training of a body of soldiers in form of batty, and making them practise the several motions and military evolutions, with the diverse management of their arms, &c. to make, or keep them expert therein against occasion.

Thus what Vegetius, and other Law-writers, call *militia*.

EXERCISE, infantry, or manual, consists in the observance of certain words of command appointed for this purpose. When a regiment is drawn up, or paraded for *exercise*, the men are placed three deep, either by companies, or divided into platoons, with the grenadiers on the right. When soldiers are drawn up for *exercise*, the ranks and files should be exactly even, and every soldier should be instructed to carry his arms well, to keep his right hand steady and even upon his shoulder, with the right hand hanging down, and the whole body without constraint. The distances between the files must be equal, and the ranks eight feet distant from each other. Every motion should be performed with life, and the greatest exactness observed in all things, wheeling, and marching; and therefore a regiment should never be under arms longer than two hours.

The following is an abstract of the words of command as the manual *exercise*, with their explanation. 1. *Post your feet*, i. e. fix the firelock with your right hand, and turn the lock outwards, keeping the firelock perpendicular; then bring up the firelock with a quick motion from the shoulder, and seize it with the left hand, just above the lock, so that the fingers may lie upon the stock, with the thumb down, and the thumb upon the stock; the firelock must not be held too far from the body, and the left hand must be of an equal height with the eyes. 2. *Cast your feet*, i. e. turn the barrel opposite to your face, and place your thumb upon the cock, raising your elbow square at this motion; then rock your firelock, by drawing your elbow down, placing your right thumb on the breech-pin, and the fingers under the guard. 3. *Present*, i. e. step back about six inches to the rear with the right foot, bringing the left toe to the front; at the same time the butt-end of the firelock must be brought to an equal height with the shoulder, placing the left hand on the barrel, and the forefinger of the right hand before the trigger, sinking the muzzle a little. 4. *Fire*, i. e. pull the trigger briskly, and immediately after bringing up the right foot to the inside of the left, come to the priming position, with the lock opposite to the right breast, the muzzle to the height of the hat, keeping it firm and steady; and at the same time seize the cock with the fore-finger and thumb of the right hand, the back of the hand being turned up. 5. *Heave out your feet*, i. e. haul back the cock briskly with a draw-back of the right elbow, bringing it close to the butt of the firelock. 6. *Handle your cartridges*, i. e. bring your right hand with a thumb round to your pouch, stopping it hard; seize the cartridge, and bring it with a quick motion to your mouth; bite the top wall off, and bring the hand as low as the chin, with the elbow down. 7. *Primer*, i. e. shake the powder into the pan, placing the three last fingers behind the rammer, with the elbow up. 8. *Draw your gun*, i. e. thrust your gun briskly, drawing your right arm at this motion towards your body, holding the cartridge fast in your hand, as before; then turn the piece nimble round to the loading position, with the lock to the front, and the muzzle to the height of the chin, bringing the right hand behind the muzzle, with both feet kept still at this motion. 9. *Charge with cartridges*, i. e. turn up your hand, and put the cartridge

into the muzzle, shaking the powder into the barrel, place your hand, guided with a quick and living motion, upon the rammer. 18. *Draw your rammer*, i. e. draw the rammer with a quick motion till out, taking it at the muzzle back-wards, draw it out, raise it, and enter it into the muzzle. 19. *Keep down your charge*, i. e. when the cartridge is down in the barrel, instantly recovering and seizing the rammer back-handed at the center, turning it, and entering it as far as the lower pipe, placing at the same time the edge of the hand on the butt-end of the rammer, with fingers extended. 20. *Keep your rammer*, i. e. turn the rammer, bringing up the piece with the left hand to the shoulder, seizing it with the right hand under the cock, keeping the left hand fast in the cock, turning the body square to the front. 21. *Shoulder your piece*, i. e. quit the left hand, and place it strong upon the butt, quit the right hand, and throw it down the right side. 22. *Rest your piece*, i. e. seize the firelock with the right hand, turning the back outwards, raise the firelock from the shoulder, and place your left hand with a quick motion above the lock, holding the piece right up and down in both hands before you, and your left hand even with your eyes. Rep briefly back with your right foot, placing it a hand-breadth distance from your left heel, and the same time bring down your firelock as quick as possible to the rest, striking it as far down before your left hand as your right hand will permit without constraint; your left hand being at the feather spring, and your right, with fingers extended, held under the guard, taking care to draw in the muzzle well towards your body, and to dress in a line with the butt end. 23. *Order your firelock*, i. e. place your firelock nimbly with your left hand against your right shoulder; quit the firelock with your right hand, sinking it at the same time with your left; seize at the muzzle, which must be of an equal height from the chin, and hold it close against your right side; lift up your right foot, and place it by your left; at the same time throw back your left hand by your left side, and with your right bring down the butt-end strong upon the ground, placing it even with the toe of your right foot, the thumb of your right hand lying along the barrel, and the muzzle kept at a little distance from your body. 24. *Ground your piece*, i. e. half face to the right upon your heels, and at the same time turn the firelock, so that the lock may point to the rear, and the flat of the butt-end be against the instep of your foot; at the same time slipping the right foot behind the butt of the firelock, the right toe pointing to the right, and the left to the front; Rep directly forward with the left foot, about as far as the swell of the firelock, and lay it upon the ground, your left hand hanging down by your left leg, and your right kept fast, with the butt-end against it; raise your left up again nimbly, bringing back your left foot to its former position, keeping your body hard to the right; face again to the left upon your heels, and come to your proper front, letting your hands hang down without motion. 25. *Take up your piece*, i. e. face to the right upon both heels, sink your body down, and come up to the position described in the second motion of ground; raise yourself and firelock, bringing it close to your right side; come to your proper front, seizing your firelock at the muzzle, as in explanation 15. 26. *Roll your firelock*, i. e. bring your right hand as far as the swell, raise the firelock high up in a perpendicular line from the ground with your right hand, and seize it with your left above the firing, the cock being at the height of the waist-belt; Rep back with your right foot, placing it behind your left heel, and come to the rest. 27. *Shoulder your piece*, i. e. lift up your right foot, and place it by your left; bring the firelock at the same time to your left shoulder, and seize the butt-end with the left hand, keeping it in the same position as above described; throw your right hand briskly back. 28. *Secure your firelock*, i. e. bring the right hand briskly up, and place it under the cock, keeping the firelock steady in the same position; quit the butt with the left hand, and seize the firelock with it at the swell, bringing the elbow close down upon the lock; the right hand being kept fast in this motion, and the piece still upright; quit the right hand, and bring it down your right side, bringing the firelock nimbly down to the lower; the left hand in a line with the waist-belt. 29. *Shoulder your piece*, i. e. bring the firelock up to a perpendicular line, seizing it with the right hand under the cock; quit the left hand, and place it strong upon the butt; quit the right hand, and bring it instantly down the right side. 30. *Fix your bayonet*, i. e. first and second motions, as in the two first of the *fixer*; quit the right hand, and bring the firelock instantly down to the left side with the left hand, as far as it will admit without constraint, seizing the bayonet at the same time with the right hand, and fixing it, placing

that hand just below the brass, with the piece kept close to the hollow of the shoulder. 31. *Shoulder your piece*, i. e. quit the right hand, and bring up the firelock with the left; seize it again under the cock with your right, as in the second motion of the *fixer*; quit the left hand, and place it strong upon the butt; quit the right hand, and bring it down the right side. 32. *Project your arm*, i. e. as explained in the three motions of the fourteenth word of account. 33. *To the right foot*, i. e. bring up the firelock with a quick motion high before you, till your left hand comes even with your eyes, with the fingers of that hand extended along the lock, just above the feather spring; the right foot to be brought close up to the left heel in this motion; face to the right taking care in facing to hold the firelock right up and down, and steady in your hands; Rep back with your right foot, and come down to your proper, as in the foregoing explanation. 34. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 35. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 36. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 37. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 38. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 39. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 40. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 41. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 42. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 43. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 44. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 45. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 46. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 47. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 48. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 49. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 50. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 51. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 52. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 53. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 54. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 55. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 56. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 57. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 58. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 59. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 60. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 61. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 62. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 63. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 64. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 65. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 66. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 67. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 68. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 69. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 70. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 71. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 72. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 73. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 74. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 75. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 76. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 77. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 78. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 79. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 80. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 81. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 82. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 83. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 84. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 85. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 86. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 87. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 88. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 89. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 90. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 91. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 92. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 93. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 94. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 95. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 96. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 97. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 98. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 99. *To the right foot*, i. e. as in the foregoing explanation; facing to the right. 100. *To the right foot*, i. e. as in the foregoing explanation; facing to the right.

E X E

There are some peculiar words of command at the manual *exercice* of the grenadiers, when apart from the battalion; and also for the cavalry and artillery.

EXERCISE, cavalry, is of two forms: on horseback and on foot. When a regiment is formed into squadrons, the ranks are arranged at the distance of twenty-four feet, and the files must keep boot-top to boot-top. In all wheeling, the flank which wheels, must come about in full gallop.

EXERCISE, artillery, is the method of teaching the regiments of artillery the art and practice of all the various business of war, as of the light field-pieces, of the parkinson and battering artillery, of the mortar and howitz. See Smith's Milit. Dict art. **EXERCISE**, **WORDS of command**. See **EXERCISE of GUNS**.

EXERCISE, in a Naval Sense, is the preparatory practice of manœuvring the artillery and small arms, in order to make the first view perfectly suited thereon, so as to direct its execution, successfully in time of battle. The words of command introduced, during the late war, for the exercise of the great guns, are the following: *Silence! all! baze your guns, level your guns, take out your limbers, run out your guns prime, point your guns, fire! charge your guns; load with carriage, load your guns; put in your limbers; baze your guns, and secure your guns.* Valcour's Marine Dict. art. EXERCISE.

ЕХН

Entrée may also denote the execution of the movements, which the different orders and dispositions of fleets occasionally require, and which the several ships are required to perform, by means of signals.

EXERCISES, in the plural, are particularly understood of what is taught young gentlemen in the academies, or riding-schools, &c. As, riding the great horse, dancing, fencing, vaulting, drawing, fortification, &c.

ENERGASIA, *Energasia*, *Expistion*, in *Rhetoric*, a *locus*, consisting of several equivalent expostitions, or such as are nearly so, in order to represent the same thing in a stronger manner.

EXERGUM, EXERGUS, or EXERGE, among *Medallists*, a word, motto, date, or the like, sometimes found under the ground, whereon the figures are represented.

The word is derived from the Greek *σῶ*, and *σῶμα*, *sōma*, *body*. Evelyn often writes it *soma*.

Exergues are most commonly placed on the reverse, though sometimes, also, on the fronts, or face-sides, of medals.

EXFOLIATION, compounded of *ex* and *folium*, leaf, in Surgery, the scaling of a bone, or its tilting, and separating in layers, or laminæ.

Any part of the surface of the cranium that has been bared, is liable to *exfoliation*. The wound must not be stopped too much, but the bone left at liberty to recover itself, which it sometimes does, without *exfoliating*, particularly in children.

EXFOLIATIVE. An *exfoliative* trepan is a trepan proper to scrape, and at the same time pierce, a bone, and to *exfoliate*, or raise, several leaves, or scales, one after another.

The use of the *asphaltic* trepan is very dangerous; as being apt to strike and disorder the brain. See BAFFATORY, and TREPAN.

EXFREDIARE, in our *Old Writers*, denotes the breaking of the peace, or committing open violence. Leg. Hen. I. cap. 31.

EX GRAVI QUERELA, in Law, a writ that lies for him to whom any lands or tenements in fee are devised by

will crucify any city, town, or borough, wherein lands are despoiled by custom; and the heirs of the despoiled, and detain them from him. Reg. Orig. 224. On Nat. B. 27. And if a man devotes such lands or tenements unto another in rail, with remainder over in fee, if the tenant in rail covenants, and is killed by force of the tithe, and afterwards die with without issue, he in the remainder shall have the writ, *ex causa mortis*, to execute that devise. New Nat. B. 441. Also where a tenant in rail dies without issue if his body, the heir of the donor, or he who hath the reversion of the land, shall have this writ, in the nature of a *Formedon* in the reverter. Ibid.

EXHALATION, a fume, or steam, *exhaling*, or *issuing*, from a body, and diffusing itself in the atmosphere.

The terms *exhalation* and *vapour* are ordinarily used indifferently, but the more accurate writers distinguish them; appropriating the term *vapour* to the moist fumes raised from water and other liquid bodies; and *exhalation* to the dry ones emitted from solid bodies; as earth, fire, minerals, sulphure, salts, &c.

In this sense, *exhalations* are dry, subtil corpuscles, or effluvia, issued from hard terrestrial bodies, either by the heat of the sun, or the agitation of the air, or some other cause; and emitted upwards to a certain height of the atmosphere, where, mixing with the vapours, they help to constitute clouds, and return back again in dews, mists, rains, &c.

Sir Isaac Newton takes true and permanent air to be formed from the exhalations raised from the hardest and most compact bodies. See AIR, DAMP, EVAPORATION, and VAPOUR.

EXHAUSTED receiver, a glass, or other vessel, applied on the plate of an air-pump, and having the air extracted out of it by the working of the engine. See **Air-pump**. Things placed in an *exhausted receiver*, are said to be in *vacuo*. See **VACUUM**.

EXHAUSTIONS, in *Mathematics*. Method of *exhaustione*, is a way of proving the equality of two magnitudes, by a *reductio ad absurdum*; shewing, that if one be supposed either greater or less than the other, there will arise a contradiction.

The *method of exhaustion* was of frequent use among the ancient mathematicians; as Euclid, Archimedes, &c. It is founded on what Euclid says in his tenth book; viz. that those quantities whose difference is less than any assignable quantity, are equal; for if they were unequal, the difference ever so small, yet it may be so multiplied, as to become greater than either of them; if not so, then it is really nothing.

This he assumes in the proof of prop. 1. book 2. which imports.

Imports, that if, from the press of two quinquies, you take more than its full, and from the remainder more than its half, and so continually, there will, at length, remain a quantity less than either of those proposed.

On this foundation, it is demonstrably, that if a regular polygon of infinite sides be inscribed in, or circumscribed about, a circle, the space, which is the difference between the circle and the polygon, will, by degrees, be quite exhausted, and the circle become equal to the polygon.

EXHERENUM, in *Natural History*, the name of a white and smooth stone, used by the ancient artificers in polishing gold. It is term'd to be the same with the lapis basiliensis, a small smooth stone which they often found in the Samian earth.

EXHEREDATION, *Exheredatio*, in the *Civil Law*, with us ordinarily call'd *disinheritance*, is the father's excluding his son from inheriting his estate.

There are four sorts of *exheredation* express'd in Justinian's Novels, without some one of which causes, he decrees the *exheredation* null, and the testament in the court, is the civil law.

Indeed, by the ancient Roman law, the father might pronounce *exheredation* without any cause; but the rigour of this law was restrain'd, and moderated, by Justinian.

EXHIBIT, in *Law*. When a deed, acquaintance, or other writing, is, in a Chancery suit, *exhibetur* to be proved by witness, and the examiner writes on the back, that it was shew'd to the witness at the time of his examination; this is call'd an *exhibit*.

EXHIBITION, a producing, or shewing, of titles, authorities, and other proofs, of a matter in contest. Anciently, they used the phrase, *exhibitione* of a tragedy, comedy, or the like; but now we say *representation*, in this respect.

EXHIBITION, *Exhibition*, in our *Old Writers*, is us'd for an allowance of meat and drink, such as was customary among the religious proprietors of churches, who usually made it to the depending vicar. The benefactions settled for the maintaining of fellows in the universities, not depending on the foundation, are also call'd *exhibition*.

EXHORTATION, *Exhortatio*, in *Rhetoric*, differs only from *suasion*, in that the latter principally endeavours to convince the understanding, and the former to work on the affections.

EXHUMATION, of *ex*, out of, and *humus*, ground, the act of digging up a body interred in holy ground, by the authority of the judge.

In France, the *exhumation* of a dead body is order'd, upon proof that he was killed in a duel. By the French laws, a parson has a right to demand the *exhumation* of the body of one of his parishioners, when interred out of the parish, without his consent.

EXIGENCE, or *EXIGENCY*, that which a thing requires, or which is expedient and suitable thereon.

EXIGENT, in *Law*, a writ which lies where the defendant, in a personal action, cannot be found, nor any thing of his within the county, whereby to be attached, or distrain'd.

It is directed to the sheriff, ordering him to proclaim and call the party five county-courts days successively, and charge him to appear, under pain of outlawry.

The same writ also lies in an indictment of felony, where the party indicted cannot be found.

It is call'd an *exigent*, because it *exigit*, i. e. *exalts*, or requires the party to appear, or, by forthcoming, to satisfy the law. If he appear not at the last day's proclamation, he is said to be *exquisit exaltus*, and then is outlaw'd. See *OUTLAWRY*.

EXIGENTIS, four officers of the court of common pleas, who make all *exigents* and proclamations, in all actions where the process of outlawry lies.

Anciently, the making writs of *superfines* upon such *exigents* as pass'd in their offices, did likewise belong to them; but this branch of business was taken from them under King James I. and committed to a particular officer in the court of common-pleas, created by patent. See *SUPERFINE*.

EXILE, *Exilium*. See *BANISHMENT*.

Among the Romans, the word *exilium*, properly signified an interdiction, or excommunication from water and fire; the necessary consequence of which was, that the interdicted person must beride himself into some other country, since there was no living without fire and water. Thus, Cicero, Ad Herennium observes, that the form of the sentence did not express *exilium*, but only *aquæ & ignis interdictum*. See *INTERDICTION*.

The same author remarks, that *exilium* was not properly a punishment, but a voluntary flying, or avoiding the punishment decreed: *Exilium non est supplicium, sed periculum, periculum supplicii*. Pro Cæcina.

He adds, that there was no crime among the Romans, as among other nations, punished with *exilium*; but exile was a resource people took voluntarily to, in order to avoid chains, scourges, flogging, &c.

The Athenians frequently sent their generals, and great men, into exile, out of envy of their merits, or distrust of their great authority.

Exile is sometimes also us'd for the relegating a person into a place, whence he is oblig'd not to stir without leave.

The word is deriv'd from the Latin *exilium*, or from *exil*, a banished person; and that, probably, from *extra seculum*, out of his native soil.

Figuratively, we use the phrase, *inexorable exile*, for an office, or employment, which obliges a man to reside in some remote or disagreeable place.

Under the reign of William, various employments were said to be *exiles*, as the Archbishop's, or even a lord-bishop's, in France, had been sometimes deem'd a kind of *exile*. A residence, or station, in some barbarous country, is also sort of *exile*.

EXIMUM, in *Law*, signifies a dwelling and, by the Statute of Marriages, is term'd a crime by the injury done to tenants, by altering their tenure, reflecting them, &c. And this is the fact, that Peter de Maribus, who distinguishes between *eximium*, *destruction*, and *exilium*. For he tells us, that *eximium* and *destruction* are almost the same, and are properly applied to houses, persons, or woods; but *exilium* is when persons are excommunicated, and afterwards unlawfully raised out of their tenements. See *lib. 1. cap. 11. de Sent. Maribus*, &c.

EXINATION, the time of *EXAMINATION*.

EXISTENCE, that whereby a thing has an actual essence, or is said to be, *esse*.

The notion of *existence* is applicable not only to a created but an uncreated substance; but it must be added, that the *existence* of created substances, and especially corporeal ones, implies a respect to place, time, and even an efficient cause; whence the metaphysicians generally define it, that whereby a thing is formally and extrinsically without respect to cause, and that here, and now.

Existence and *essence* come very near the notion of each other; in effect, they only differ in that we have different manners of conceiving the same thing.

For, 1. *Existence* is usually explained either by the first, noblest, and radical attribute of the thing, e. g. that of body, by extension; that of mind, by thinking, &c. or by specifying all the inmutable attributes; and *essence*, either by specifying all place and all time as in that of God; or by specifying some definite place, and time, together with the cause, as in the creatures.

2. The foundation and origin of this distinction are that *existence* belongs to the question, *What is it?* *Essence* to the question, *What is it?* *Existence* is not *essence*.

3. *Existence* necessarily presupposes *essence*, and cannot be conceived without it; but *essence* may be conceived without *existence*, in that *essence* belongs equally to things that are *possible*, and in *act*, but *existence* only to those in *act*. Note, however, that this does not obtain in God, whose whole nature and *essence* the mind cannot think without conceiving his *existence*.

We have divers ways of arriving at the knowledge of the *existence* of things. Our own *existence* we know by intuition; the *existence* of a God, by demonstration; and that of other things, by sensation.

As for our own *existence*, we perceive it so plainly, that it neither needs, nor is it capable of any proof. In every act of sensation, reasoning, or thinking, we are conscious to ourselves of our own being, and in this matter come not short of the highest degree of certainty.

As to our knowledge of the *existence* of a God, though he has given us no immediate sense of himself, yet, having furnished us with faculties of unity, perception, and reason, we can never want a clear proof thereof. See *God*.

The knowledge of the *existence* of other things, i. e. of external objects, bodies, a world, &c. we only have by sensation; for there being no necessary connection of *existence* with any idea which lasts in the memory, nor of any other *cause*. But that of God, with the *existence* of any particular man, his particular man can know the *existence* of any other being, but only when, by act, containing upon him, it makes itself be perceived by him. The having of the idea of anything is *possible*, no more proves the *existence* of that thing than the picture of a man evidences his being in the world, or the vision of a dream makes a man happy. It is, therefore, the actual receiving of ideas from without that gives us notice of the *existence* of other things, and makes us know that something hath *esse* at that time without us, which causes that we are, though we neither know nor consider how it doth it.

This notice which we have by our senses, of the *existence* of things without us, though it be not altogether to certain as intuition and demonstration, yet deserves the name of knowledge, if we persuade ourselves, that our faculties act and inform us right concerning the *existence* of those objects that affect them.

Now, besides the assurance of our senses themselves, that they do not err in the information they give us of the *existence* of things without us, we have other concurrent reasons: as, 1. It is plain that perceptions are produced in us by exterior causes affecting our senses; because those that want the organs of any sense never have the ideas belonging to that sense produced in their minds. 2. Because we find we cannot avoid having those ideas produced in our minds. When our eyes are shut, we can at pleasure recall to our mind the ideas of light or the sun, which former sensations had lodged in our memories; but if we turn our eyes towards the sun, we cannot avoid the idea which the light or the sun then produces in us, which shows a manifest difference between those ideas laid up in the memory, and such as force themselves upon us, and we cannot avoid having; besides, there is no one who does not perceive the difference in himself between actually looking upon the sun, and contemplating the idea he has of it in his memory; and therefore he hath certain knowledge, that they are not both memory or fancy. 3. Add to this, that many ideas are produced in us with pain, which we afterwards remember without the least offence; thus, the pain of heat, or cold, when the idea of it is received in our mind, gives us no disturbance, which, when felt, was very troublesome; and we remember the pain of hunger, thirst, head-ach, &c. without any pain at all, which would either never distinguish, or else constantly do it, as often as we thought of it, were there nothing more but ideas existing in our minds, and appearances entertaining our faculties, without the real *existence* of things affecting us from abroad. 4. Our senses, in many cases, bear witness to the truth of each others report concerning the *existence* of sensible things without us: he that doubts, when he feels a fire, whether it be real, may feel it too if he pleases; and, by the exquisite pain, may be convinced, that it is not a bare idea or phantom. Such is Mr. Locke's demonstration of the *existence* of external bodies.

The ingenious Dr. Berkeley has a different system: external bodies, he contends, have no *existence*, but in a mind perceiving them; that is, they only *exist*, *quatenus* they are perceived; and of this he has given us what he and many others account a demonstration.

In reality, "that neither our thoughts, passions, nor ideas, formed by the imagination, exist without the mind, he observes, is allowed; and that the various sensations impressed on the mind, wherever objects they come from, cannot exist otherwise than in a mind perceiving them, is not less evident. This appears from the meaning of the term *exist*, when applied to sensible things. Thus, the table I write on, *exists*, i. e. I see and feel it; and were I out of my study, I should say it *existed*, i. e. that were I in any study I should see and feel it as before. There was an odour in it, i. e. I smelt it, &c. but the *existence* of unthinking beings, without any relation to their being perceived, is unintelligible, *their esse est percipi*. The notion of bodies, he endeavours to show, is founded on the doctrine of abstract ideas: "What are light and colours, heat and cold, extension and figure, in a word, the things we see and feel, but so many sensations, notions, ideas, or impressions on the sense? And is it possible to separate, even in thought, any of these from perception? The several bodies, then, that compose the frame of the world, have not any subsistence without a mind: their *esse* is to be perceived or known; and as long as they are not perceived by me, nor any other thinking being, they have no *existence* at all. The things we perceive, are colour, figure, motion, &c. that is, the idea of those things; but has an idea any *existence* out of the mind? To have an idea is the same thing as to perceive; that, therefore, wherein colour, figure, &c. exist, must perceive them. It is evident, therefore, there can be no unthinking substance or substratum of those ideas; but you may argue, if the ideas themselves do not exist without the mind, then may be things like them, whereof they are copies or resemblances, which exist without the mind; it is answered, an idea can be like nothing but an idea; a colour or figure can be like nothing else but another colour or figure. It may be further asked, whether those supposed originals, or external things, whereof our ideas are the pictures, be themselves perceptible or not? If they be, they are ideas; if they be not, I appeal to any one, whether it be possible

to say, a colour is like somewhat which is invisible; hard or soft, like somewhat intangible, &c. Some distinguish between primary and secondary qualities: the former, viz. extension, solidity, figure, motion, rest, and number, they maintain have a real *existence* out of the mind; as for the latter, under which come all other sensible qualities, as colours, sounds, tastes, &c. they allow the ideas we have of them are not resemblances of any things existing without the mind, or unperceived, but depend on the size, texture, motion, &c. of the minute particles of matter. Now, it is certain, that those primary qualities are inseparably united with the other secondary ones, and cannot even in thought be abstracted from them, and therefore must only exist in the mind. Can any man conceive the extension and motion of a body without its other sensible qualities? For my part, I find it impossible to frame an idea of a body extended and moving, without giving it some colour, &c. In effect, extension, figure, and motion, abstracted from all other qualities, are inconceivable; where the others, therefore, are, there these too must be, i. e. in the mind, and no where else. Again, great and small, swift and slow, are allowed to exist nowhere without the mind, being merely relative and changing, as the frame or position of the organ changes: the extension, therefore, that exists without the mind, is neither great nor small, the motion neither swift nor slow; i. e. they are nothing. That number is a creature of the mind, is plain (even though the other qualities were allowed to exist) from this; that the same thing bears a different denomination of number, as the mind views it with different respects; thus, the same extension is 1, or 3, or 36, as the mind considers it, with reference to a yard, a foot, or an inch. Nay, many of the modern geometers hold, that a finite line may be divided into an infinite number of parts, and each of those infinitesimals into an infinity of others; and so on, in infinitum; so that the same thing is either unity or infinity, either no number or all number. In effect, after the same manner as the modern philosophers prove colours, tastes, &c. to have no *existence* in matter, or without the mind; the same thing may be proved of all sensible qualities whatsoever; thus, they say, heat and cold are only the affections of the mind, not at all patterns of real beings existing in corporeal substances; because the same body which seems cold to our hand seems warm to another. Now, why may we not as well argue, that figure and extension are not patterns or resemblances of qualities existing in matter; because the same eye, at different distances, or to eyes of different stature, at the same station, they appear various? Again, sweetness, it is proved, does not exist in the thing itself, because the thing remaining unaltered, the sweetness is changed to bitterness, as in a lemon, or by an otherwise vitiated palate. Is it not as reasonable to say, that motion does not exist out of the mind? Since, if the succession of ideas in the mind become swifter, the motion, it is acknowledged, will appear slower, without any external alteration. Again, were it possible for solid figured bodies to exist out of the mind, yet it were impossible for us ever to know it: our senses, indeed, give us sensation of ideas, but do not tell us that any things exist without the mind, or unperceived, like those which are perceived: this the materialists allow. No other way therefore remains, but that we know them by reason's inferring their *existence* from what is immediately perceived by sense. But how should reason do this, when it is confessed, there is not any necessary connection between our sensations and these bodies? It is evident, from the phenomena of dreams, phantasies, &c. that we may be affected with the ideas we have now, though there were no bodies existing without them; nor does the supposition of external bodies at all forward us, in conceiving how our ideas should come to be produced. The materialists own themselves unable to conceive in what manner body can act on spirit, or how it should imprint any idea on the mind. To suppose, therefore, bodies existing without the mind, is a little else than to suppose God has created innumerable beings entirely useless, and serving to no purpose at all. On the whole it appears, that the *existence* of bodies out of a mind perceiving them, is not only impossible, and a contradiction in terms; but were it possible, nay real, it were impossible we should ever know it. And again, that supposing that there are no such things, yet we should have the very same reason to suppose there were that we now have. Suppose, e. g. an intelligence affected with the same train of sensations, impressed in the same order, and with the same vivid-

"nests, would it not have all the reason to believe the
 "presence of bodies represented by his ideas that we have?
 "All our ideas and sensations are visibly insensible, nay,
 "the very being of an idea implies passiveness and in-
 "ertness; so that it is impossible for an idea to do any
 "thing, or, in strictness, be the cause of any thing; it
 "cannot, therefore, be the remembrance or pattern of
 "any active being, unless opposites can be said to re-
 "semble one another. Now, we find a continual sus-
 "tention of ideas in the mind; but, therefore, it has been
 "proved, do not depend on any external body or their
 "cause; it remains, therefore, that their cause is an in-
 "corporeal active substance or spirit: for that I am not
 "the cause of my own ideas, is plain from this, that
 "when I open my eyes in broad day-light, I cannot help
 "seeing various objects. Now, the fixed rules or meth-
 "ods wherein the mind we depend on exists in us
 "the ideas of sense, are called *laws of nature*; these we
 "learn by experience, which teaches us, that such and
 "such ideas are attended with such and such other ideas
 "in the ordinary course of things. Ideas are not any
 "how, and at random, produced; there is a certain
 "order and connection established among them like
 "that of cause and effect; and there are several com-
 "binations of them made in a very regular artificial manner,
 "which we call *logics*, and the system of those, the
 "world. In strictness, however, the connection of ideas
 "does not imply the relation of cause and effect, but
 "only of a mark or sign of the thing signified; the fire
 "I see is not the cause of the pain I feel, but the mark
 "that forewarns me of it; the noise I hear is not the
 "effect of this or that motion or collision of natural bod-
 "ies, but the sign thereof. The Cartesianists own some-
 "what like this; the action of bodies in our organs, say
 "they, is not the efficient cause of our ideas and per-
 "ceptions, but only the occasional cause, which deter-
 "mines God to act on the mind, according to the laws
 "of the union of the soul and body." See CAUSE.
 "Dr. Berkeley, indeed, taking away bodies, takes away
 "what these philosophers account the occasions of their
 "ideas: "by an occasion, he says, must either be meant
 "the agent that produces an effect, or something ob-
 "served to accompany or go before it in the ordinary
 "course of things; but matter is allowed to be passive
 "and inert, and cannot therefore be an agent or efficient
 "cause; and this matter primitively, and in itself, is al-
 "ways imperceptible, and devoid of all particular sen-
 "sible qualities; i.e. it has not this or that particular
 "colour, this or that particular figure, &c. but has co-
 "lour in the general, figure in the abstract, &c. but an
 "abstract is no object of sense; matter, therefore, can-
 "not be the occasion of our ideas in the latter sense."
 "See BECKL. Princip. of Human Knowl. See ANTI-AC-
 "TION.

How far the great argument of the maintainers of a ma-
 "terial world from the impossibility of God's deceiving us
 "and from the evidence that he does so, if there be no such
 "thing, will go against this reasoning, we leave to the
 "reader. See STANT. Hill. Philosph. part xii. p. 816.
 "where the objections of the ancient Pyrrhonist to the
 "existence of bodies are recited.

As to the *existence* of spirits, Mr. Locke allows, that our
 "having ideas of them does not make us know that any
 "such things do exist without us; or that there are any
 "finite spirits, or any other spiritual beings, but God.
 "We have ground from revelation, and several other rea-
 "sons, to believe with assurance that there are such
 "creatures; but our senses being not able to discover
 "them, we want the means of knowing their particular
 "existence; for we can no more know that there are finite
 "spirits really existing by the idea we have of such beings,
 "than by the ideas any one has of fairies or centaurs, he
 "can come to know that things answering to those ideas
 "do really exist.

EXII, properly expresses the departure of a player from
 "off the stage, when he has acted his part.
 "The word is also used in a figurative sense, to express any
 "kind of departure, even death.

EXITERIA, *Exitia*, in *Antiquity*, oblations or prayers
 "to any of the gods for a prosperous expedition or journey.
 "There were also feasts under this denomination, which
 "were celebrated by the Greeks with sacrifices and prayers,
 "when their generals undertook expeditions against any
 "enemy.

EXITUS, *Exitus*, in *Law*, the yearly rents or profits of
 "lands or tenements. See ISSU, &c.

EXILEGALUIS, in *Law*, the same with an outlawed
 "person. See OUTLAW.

EX MERO MOTU, formal words used in the king's
 "charters and letters patent, signifying that he does what
 "is contained therein of his own will and motion.

The effect of these words is to bar all exceptions that

might be taken to the instrument, by alleging that the
 "prince in passing such charter was abused by false sug-
 "gestion.

EXOCATACELLUS, in *Antiquity*, a general denomina-
 "tion, under which were included several grand officers
 "of the church at Constantinople; as, the grand oecome-
 "nus, grand fecundinus, grand master of the chapel,
 "grand fecopaphys or keeper of the vessels, grand catar-
 "tophys, the master of the little chapel, and the protos-
 "phylax, or first advocate of the church.

There are many opinions with respect to the etymology
 "of this term. F. Olear apprehends, that all the inferior
 "priests were called *Katastatai*, *katartoi*, q. d. people of a
 "low condition; and that their superiors were called *exo-
 "catastatai*, q. d. people out of the number of *katartoi*, or
 "above them. Upon the whole, however, he adheres to
 "the sentiment of G. Corneius, who says, that the patri-
 "archal palace, and the apartments of the syneculus, and
 "of the monks in the patriarch's service, were in a very
 "low part of the city, which, with regard to the rest,
 "seemed a valley or pit; and that the officers above men-
 "tioned had their several houses or palaces *exo*, out of the
 "valley; whence the name *exocatastatai*. M. Du-Cange
 "derives the appellation from their being above the level or
 "rank of the other clerks, and seated at church, &c. in
 "more honourable places, erected for that purpose on
 "either side of the patriarch's throne.

The *exocatastatai* were of great authority: in public as-
 "semblies they had the precedence of bishops; and in the
 "patriarchate of Constantinople did the office of deacons,
 "as the cardinals originally did in the church of Rome.
 "Accordingly, in the letter of John IX. to the emperor
 "Basilus Leo, they are called *cardinales*.
 "At first they were priests; but some patriarchs of Con-
 "stantinople, whom Codin does not mention, would have
 "them for the future to be no more than deacons. The
 "reason was, that being priests, except they had their
 "several churches, wherein they were to officiate on all the
 "grand festival days, so that it unhappily out, the patri-
 "arch on the most solemn days was deprived by all his
 "chief ministers.

EXOCENTRA, *Exocentrai*, in *Classical Antiquity*. The
 "Arians were first called *Exocentrai*, because, when ex-
 "pelled the city by Theodosius the Great, they retired in-
 "to a place called *Exocentra*, and there held their as-
 "semblies. Justinian gave the orthodox all the churches
 "of the heretics, excepting that of the *Exocentra*.

The word is derived from *Exocentra*, or *Exocentra*,
 "the name of the place above mentioned. Codin, in his *Origines*,
 "says, that the *Exocentra* was a place encompassed
 "with a wall, built and adorned by Constantine; and
 "that without the circumference of the wall there was a
 "column, with a statue of that emperor, whence the
 "place took its name, viz. from *Exo*, without, and *centra*,
 "column.

EXOCETUS, in *Ichthyology*, the name of a genus of
 "fishes, of the order of *abdominale* in the Linnæan system,
 "and in the Artedien, of the *macropogonius* or fish-
 "finned kind; the characters of which are these: the
 "branchiæ membrane contains ten bones, four
 "of which are broad, and are covered by the opercula of the
 "gills, and all of them are very difficult to be counted.
 "The pectoral fins are very long; there is but one fin on
 "the back, and that is placed toward the lower part of it.
 "The scales are large. Artedi and Linnæus enumerate
 "only two species of this genus. See TAB. IV. *Fish*, No. 41.
 "and article FLYING *Fish*.

EXODIARY, *Exodiarius*, in the *Ancient Roman Trage-
 "dies*, was a droll, or mime, who appeared on the stage
 "when the tragedy was ended, and performed what they
 "called the *exodium*, or conclusion of the show, to divert
 "the company.

EXODIUM, *Exodium*, in the *Ancient Greek Drama*, was one
 "of the four parts or divisions of a tragedy.

The word is formed from the Greek, *exodo*, *going out*,
 "*discession*, of *ex* and *odo*, *way*, *road*. Festus, lib. v. cal s
 "it *exodus*.

The *exodium*, according to Aristotle, was so much as
 "was rehearsed after the chorus had ceased to sing for the
 "last time; so that *exodium* with us was far from being
 "what the epilogue is with us, as several people have
 "imagined it was.

The *exodium* was so much of the piece as included the
 "catastrophe and unravelling of the plot, which cata-
 "strophe, &c. in pieces regularly composed, always be-
 "gan after the last singing of the chorus, answering merely
 "to our fourth and fifth acts. M. Dacier's Comment. on
 "Aristotle's Poetics, chap. 12. See CATASTROPHE and
 "CHORUS.

Among the Romans the *exodium* was a different thing; it
 "was pretty nearly what *farces* are with us. After the
 "tragedy was over, came a pantomime on the stage, call-

ed the *exultans*, who, by his grimace, jelling and buffoonery, diverted the people, comforted their minds, and wiped away the tears which the tragic spectacle had occasioned to be shed.

Vigore on *T. Liry* says, the *exulans* consisted of certain humorous, strolling verses, rehearsed by the youth at the end of the *fabulae* *adversus*, and answering to our farces. In another place, the same author says, that the *exulans* were a kind of interludes in the intervals between the acts, partly fable and pleasantries, partly music, &c. to give time both for the spectators and actors to recover breath. The passage in *Liry*, whence he takes the notion, is lib. vii. dec. 1. *Ridicula interea versibus qua juvenes ante se mare antiqua fallax capta, capta conjecta sunt fabulis pacissimum attulimus*. See also *Juvénal*.

Ubi hinc exodus rixum movet attulamus
Giglius *Inter. vi.*

EXORTUM, in the *Septuagint*, signifies the end or conclusion of a feast.

The Hebrew text calls the day *עֶזְרָת*, which the Seventy render *Exortum*.

In particular, *exortum* is used for the eighth day of the feast of tabernacles, which, it is said, had a special view to the commemoration of the Exodus, or departure out of Egypt, though there is nothing of it expressed in Scripture.

EXORTUS, was also the name of a song sung at the conclusion of a meal or feast.

EXODUS, the second of the five books of Moses.

The word in its original Greek, *Exodus*, literally imports a going out, or journey; and was applied to this book, because the history of the Israelites' passage out of Egypt is related therein. Beside this, it contains the story of what was transacted in Egypt from the death of Joseph to the delivery of the Jews; as well as what passed in the wilderness, and particularly at mount Sinai, to the building of the tabernacle.

The Hebrews call it *Exodus*, *q. d. hinc venimus*, that is, the initial words of the book for the same reason they call Genesis, *Bereshit*, *q. d. in principio*, in the beginning.

EX OFFICIO, denotes the power a person has in virtue of his office, to do certain things without being applied to.

By a branch of statute; *Eliza*, the queen, by her letters patent, might authorize any persons exercising ecclesiastical jurisdiction in admitting an oath, *ex officio*, whereby supposed offenders were forced to confess, accuse, or clear themselves of any criminal matter, &c. but this branch relating to this oath is repealed by 17 Car. I. cap. 12.

EX OFFICIO INFORMATIONIS. See *INFORMATION*.

EXOLICITEUS, in *Natural History*, a name used among the writers of the middle ages, to express a kind of stone which had such a variety of colours that it dazzled, as they say, people's eyes in looking at them. It is said to have been found in Lybia. The name is probably only a corruption of the hexacaulonites of Piny and the older writers; and this seems to have been no other than a name for the opal.

EXOMIS, of *ex*, out of, and *omis*, *border*, in *Antiquity*, a frain narrow garment through which the shoulders appeared. It had something in common with the tunic, and something with the pallium. It was worn by slaves, servants, and the lower classes of people among the Romans.

EXOMOLOGESIS, *Exomologesis*, formed of *Exomologesis*, *Exomologesis*, a term little used but in speaking of the ancient ceremony of repentance, whereto the *exomologesis*, by us called *confession*, was a part. Some of the ancients, and particularly Tertullian, de *Poenit.* cap. 9. use the word in a greater latitude, as comprehending the whole of repentance.

A public *exomologesis* was never commanded by the church for secret sins, as may be seen in the capitulars of Charlemagne, and the canons of divers councils.

EXOMPHALUS, *Exomphalus*, of *ex*, out, and *omphalos*, *navel*, in *Surgery*, a general name, comprehending all kinds of navel-tumors. The first are tumors or swellings of the solid parts, whereto there are three varieties, denominated from the several parts affected, as the *interomphalus*, *epi-omphalus*, and *peri-omphalus*. The second are tumors formed by collections and gatherings of humours, of which there are four varieties, distinguished by the particular humours they are formed of, as the *hydropomphalus*, *pyromphalus*, *fangomphalus*, and *varicemphalus*. The third are those compounded of both the other, viz. the *enterohydropomphalus* and *epi-omphalus*. See each species under its several head.

In one of those cases which Mr. Mery has given an account of, the infant was born alive, but died after four-

teen hours; the tumor was very large; and on opening it the liver, spleen, stomach, and intestines, were found all included in it; yet its aperture at the navel was but little more than an inch in diameter. The most natural conjecture in this case seemed, that the viscera had been forced out of the body by some accident during pregnancy; and that the peritonaeum, as they enlarged in growth, had extended itself by degrees to the circumference of this sack; but, on a strict enquiry, the sack was found to be composed of a double membrane; so that it could not be a production of the peritonaeum, which is single, but it must necessarily have been an extension of the membranes of the placenta, which, uniting, form the umbilical cord; and it was not less easy to determine that the viscera could not have been forced out of the body when at any considerable growth, as the aperture was so small, the liver alone being of six times its diameter. It appears, therefore, that in these cases the viscera get out while very small, and grow and enlarge in their unnatural situation. The parent of the infant being asked if she had received any injury during her pregnancy, could not recollect any; but only observed, that while young with child, she had been very strongly affected by the sight of the entrails of an ox hanging out of its belly at a butcher's. *Mem. Acad. Par.* 1716. See *HEARNIA*.

EXONEIROSI, from *ex*, out, and *neiros*, *drum*, a nocturnal pollution or emission of the semen in dreams. This, if it happens but rarely, is usually a sign only of redundant vigour; but if it happens frequently, is a sign of weakness of the seminal vessels, which is most frequently the case.

EXONERATIONE FELIX, in *Law*, a writ that lay for the king's ward, to be freed from all suit to the county-court, hundred-court, &c. during the wardship. *F. N. B.* 158.

EXONYCHOS, of *ex*, without, and *onx*, a nail, in *Beauty*, a name given by some of the ancient writers, among whom are *Dioscorides* and *Pliny*, to the *GRONWELL* or *lithiopermum*. See *GRONWELL*.

EXOPHTHALMIA, of *ex*, out, and *ophthalmos*, *eye*, in *Surgery*, is a protuberance of the eye out of its natural position.

EXORCISM, *Exorcismi*, prayers or conjurations wherewith to exorcise, i. e. drive out devils or demons from persons apprehended to be possessed or to preserve from danger. The word is derived from the Greek, *exorcizo*, *exorcizo*, *exorcizo*, is *adversus*, or *contra*. In most dictionaries, *exorcism* and *conjuration* are used as synonymous; but, in reality, *conjuration* is only a part of the *exorcism*; and the *exorcism* the ceremony entire. The *conjuration* is properly the formula, where the devil is commanded to come forth, &c.

Exorcismi are of great use in the Romish church: their priests, &c. are frequently exercising diabolical persons. The priests make holy water by exorcising common water a certain number of times. In reality, the *exorcism* is a part in itself of their consecrations. *Exorcismi* had anciently another and farther purpose; being applied by way of trial or purgation to extort the truth from the accused.

The *exorcism*, in this sense, was a sort of bread conjured and exorcised for the purpose; and the opinion was, that if the person was criminal he could not swallow the bread.

This, it seems, was a frequent practice in the time of our Edward III. and the bread thus exorcised was to be COARSE.

Linderbroeck gives instances of *exorcismi* with barley-bread, and others with cheese; and hence, probably, might arise that popular imprecation, "May thy bread choke me, if I tell a lie." See *ORDEAL* and *JUDICIUM DEI*.

EXORCIST, in the *Romish Church*, a priest, or tonsured clerk who has received the four lesser orders, one of which is that of *exorcist*.

The term is likewise applied to a prelate, or to a priest delegated by a prelate, who actually exorcises a person possessed.

It is a dispute among divines whether ever the Greeks had any such order as that of *exorcist*. Fa. Gear, in his Notes on the Greek Ecclesiology, has made it probable they had, from several concurring passages in St. Dionysius and St. Ignatius Martyr.

The ordination of *exorcists* is performed in the time of mass, their principal office being to exorcise devils. The fourth council of Carthage, can. 7. appoints, that in the ordination of *exorcists*, the bishop, putting the book of exorcisms in their hands, shall say these words: "Receive it, and keep it in remembrance, and have power to lay hands on *vaigamini*, whether baptised or catechumens;" which form still obtains.

M. Fleury

M. Fleury mentions certain people among the Jews who travelled round the country, making profession of driving out devils by invocations, which they pretended, had been taught them by Solomon; these were also called *exorcists*. See Joseph. Antiq. Jud. lib. viii. cap. 2. Oken. Tract. xxv. in Matt. 23. 63.

EXORDIUM, in Oratory, the preamble or beginning of a discourse or speech, serving to prepare the audience, and introduce the matter in hand.

The word is formed from the Latin *ordiri*, to begin, by a metaphor taken from the weaver, who are said, *ordiri trama*, to begin or wrap a web by disposing and ordering the threads in a certain manner for the future work. See **WEB**.

The *exordium*, on other occasions, is called the *praefatus*, *prooemium*, and *proem*.

Cicero defines *exordium*, a part of an oration, whereby the minds of the audience are duly prepared for what remains to be said. The *exordium* is a part of principal importance, and is to be laboured with extraordinary care; whence Tully calls it *difficilissima pars orationis*.

Exordium are of two kinds; either full and formal, or vehement and abrupt. In the first, the audience is prepared and conducted by due and easy steps; in the second, the orator, as if seized with some sudden passion, breaks out upon his audience at once. Such is this *exordium* of Isaiah: *Hear, O heavens! and give ear, O earth!* Or that of Cicero against Catiline: *Quisquam tandem abstinere patientia vestra, Catiline? Abrupt exordium* are most suitable on occasions of extraordinary joy, indignation, or the like; though we have instances of penegetics of the greatest orators, begun abruptly, without any such occasions. Such is that of Gorgias, who began his elege of the city and people of Elis with *ἡλια, ταχὺν ἐξορδίζω, ἡλια βραχὺν ἀνίσταται*. Abrupt, hally, *exordium*, were more to the taste and manner of the Greeks than of the Latins. The objects which the orator should have in view in this part of his discourse, are to gain the good opinion of his hearers, to secure their attention, and to give them some general notion of his subject; and therefore the requisites in an *exordium* are, 1. *Prospicity*, whereby the *exordium* appears easy and natural, becomes a piece with the whole discourse, and matches it as a part does the whole; so that it could not be accommodated to any other, or, perhaps, a contrary occasion. The ancient orators were very defective in this point; their *exordium* had frequently nothing in common with the subject.

2. *Melody*, or an ingenious balisulphus, which recommends the orator exceedingly to the favour of his audience. This is what Cicero calls to much in L. Crassus, *Est enim in L. Crassi pulchrum exordium, quod non modo non debet esse orationis, sed etiam probatur commendatione prodigiosa*. The fine lively words of himself, that at the beginning of his oration every limb trembled, and his whole mind was in a flutter. The vain glory of that master should be carefully avoided, of whom Horace speaks, and who began his poem *Fortunam Præmum canit* & *suble bellum*.

3. *Brevity*, not amplified or swelled with a detail of circumstances, or a long circuit of words; and in this respect it should be accommodated to the length of the discourse.

4. The style of the *exordium* should be full, easy, and pleasant. Quintilian facetiously compares a faulty *exordium* to a fearful face, which is presently discerned, and very disagreeable. Thus Cicero, *Vestibula, aditusque ad causam facies iudicis*.

The *exordium* appears an essential part of an oration; though anciently, in the Aetopians, Julius Pollux tells us they spoke without any *exordium*, and passions, and any peroration or epilogue. The like is said to have been done by Xenophon, who began thus: *Darius & Persarum haec baluere fuit*.

EXORMISTOS, in Ichthyology, a name given by some of the old writers to that species of the *petromyzon* which other authors call the *lac-petra fluviatilis*, and we in English the lamprey. This is distinguished by Arted from the name of the *petromyzon*, with only one series of small teeth in the verge of the mouth, and some large ones below. See **MISTELA**, **LAMPETRA**, and **PETROMYZON**.

EXOSPHIS, in Ichthyology, a name given by Gesner and Rondestom to the fish which we call the *hays* or *isthophis* *cauda piscis*, from the drop called *isthophis*, or *isthophis*, being procured from it. It is properly a species of the *acipenser*, and is distinguished from the common *sturgeon* by its having no tubercles. See **ACIPENSER**.

EXOSTOSIS, from *ex*, out, and *stos*, a bone, in Anatomy, is properly an acute emulgence or excrescence, pushing preternaturally above the bone, but creating sometimes

no disturbance, pain, or deformity, and unaccompanied with a caries or *spina ventosa*. When this is the case, it is always best to let it alone; for the attempt to remedy often proves much worse than the disease; and by laying the bone bare, a caries, or other inconvenience is brought on. On the other hand, when this disorder occasions pain or deformity, or impedes any action, or produces other mischief, it may be remedied by taking off the preternatural part of the bone in the same manner as in cases of the *spina cariosa*.

EXOSTRA, in the Ancient Theatre, a place where such parts of the play were raised as were supposed to be acted privately in the house.

EXOSTRA, was likewise the name of a washing engine used in the streets of towns.

EXOTERIC and **ESOTERIC**, are terms denoting *external* and *internal*, and applied to the double doctrine of the ancient philosophers: the one was public, or *exoteric*; the other secret, or *esoteric*. The first was that which they openly professed and taught to the world; the latter was confined to a small number of chosen disciples. This method was derived originally from the Egyptians, who, according to the united testimony of Herodotus, Diodorus Siculus, Strabo, Plutarch, &c. had a twofold philosophy, one secret and farrel, another public and common. The same practice also obtained among the Persian Magi, the Druids of the Gauls, and the Brahmins of India. The *exoteric* priests, with whom it originated, followed the character of judges and magistrates, and probably introduced this distinction with a view to the public welfare, and to serve the purposes of legislation and government. Clement of Alexandria informs us, that they communicated their mysticis principally to those who were concerned in the administration of the state; and Plutarch confirms the same declaration. However, others have supposed that they invented the fables of their mysticis, and the other external ceremonies of their religion, to amuse and conceal natural and moral truths; and therefore was the motive of their mysticis, &c. &c. &c. applied to political purposes.

EXOTIC, *Exoticus*, a term usually signifying foreign, or *extraneous*, i. e. coming from some remote or strange country. In which sense we sometimes say, *exotic*, or *extraneous* trees, or *exotic*, or *extraneous* birds, &c.

The word is derived from the Greek, *ἐξωτός*, *exōtōs*, without, or *extraneous*.

EXOTIC, is chiefly applied to plants which are natives of foreign countries, particularly those brought from the East and West Indies, and which do not naturally grow in Europe.

The generality of *exotic*, or *exotic* plants, do not thrive in England without some peculiar care and culture; they require the warmth of their own climates; whence the use of hot-beds, glass-frames, green-houses, &c. See **GLASS-HOUSE**, and **GREEN-HOUSE**.

In sending plants from one country to another, great cautions are necessary. The plants sent from a hotter country to a colder should be always put on board in the spring of the year, that the heat of the season may be advancing as they approach the colder climates; and on the contrary, those which are sent from a colder country to a hotter should be sent in the beginning of winter.

The best way of packing up plants for a voyage, if they be such as will not bear keeping out of the earth, is to have boxes with handles, filling them with earth, and planting the roots as close together as may be; the plants should be set in these boxes three weeks before they are to be put on board, and in good weather they should be set upon the deck, and in bad removed or covered with a tarpaulin.

If they are going from a hotter country to a cold one, they must have very little moisture; if, on the contrary, they are going from a colder to a warmer, they may be allowed water more largely; and being shaded from the heat of the sun, they will come safe.

Many plants, however, will live out of the earth a great while; as the sedums, euphorbias, scrofulas, and other succulent ones. These need no other care than the packing of them up with moss in a close box; and there should be a little hay put between them, to prevent them from wounding or bruising one another, and holes bored in the boxes to keep them from heating and putrefying. In this manner they will come safe from a voyage of two or three, or even four or five months.

Several trees also will come safely in the same manner, taking them up at a season when they have done growing, and packing them up with moss. Of this sort are oranges, olives, capers, jasmines, and pomegranates. These, and many others, are annually brought over thus from Italy; and though they are three or four months in the passage, seldom miscarry. And the best way of sending

ing over feeds is in their natural huts, in a bog or packed up in a good-shell, keeping them dry, and out of the way of vermin. Miller.

Dr. Lister has a discourse in the *Philosoph. Trans.* on *Eastic Disasters*, i. e. such diseases as are never bred among us, but brought, from time to time, by infection, from other countries. Such, according to this author, are, 1. The *plague*, which is properly a disease of Asia, where it is epidemic. 2. The *small-pox*, which is an oriental disease, and not known to Europe, or even Asia Minor or Africa, till a spice trade was opened to the remotest part of the Indies, whence it originally came, and where it still rages more cruelly than among us. 3. The *rising of the guts*, which he takes for a disease peculiar to the West Indies, and yearly received from thence: for this, he adds, is a quite different disease from the *terrene virus* of the ancients, and is scarce ever known in the mid-land countries, or far in the North of England.

EXOCORONIA, in *Church History*, a kind of Arian heretics, who maintained that the Son of God was made out of nothing: i. e. *Ex nihilo factus*, supposed by Gethird to be the same with the *EXOTICORONIA*: but this opinion is contradicted by the authority of Theodoret.

EXPANSION, in *Metaphysics*, expresses the idea we have of lasting, or preferring distance, i. e. of distance, all the parts whereof exist together.

EXPANSION, in *Physics*, is the dilating, stretching, or spreading out of a body; whether from any external cause as the case of rarification, or from an internal cause, as elasticity. Bodies naturally expand by heat beyond their dimensions when cold; whence their specific gravities are different at the different seasons of the year. Air compressed or condensed, as soon as the compressing or condensing force is removed, expands itself by its elastic power to its former dimensions.

Dr. Halley sensibly by experiment, that water expands itself by one forty-sixth part of its bulk, when made to boil; but a moderate heat does not induce any sensible expansion at all. Mercury, with a very gentle heat, expands itself one forty-fourth part of its ordinary dimensions.

Spirit of wine with a heat less than that of boiling water expanded itself by one-twelfth part of its bulk, and then began to boil. The most sensible expansion of water is in freezing. Mr. Boyle, in his *Hist. of Cold*, affirms us, that ice takes up one-twelfth part more space than water. Dr. Gregory, in his *Astron.* p. 407, proves, that a globe of our air, of an inch diameter, if it were removed to the distance of a semidiameter of the earth, would expand itself to fill all the planetary region as far as, say, far beyond the sphere of Saturn. See *AIR*. Solid bodies, as well as fluid, easily expand with heat. See *HEAT*, *DILATATION*, and *PERMEABILITY*.

EXPANSUM Polarium. See *POLARICUM*.

EX PARTE, i. e. partly, or ex parte. A *communio ex parte* is that taken out and executed by one party only; where both parties join it is called a *joint communion*. See *COMMUNION*.

EX PARTE TAILS, in *Law*, a writ that lies for a bailiff or receiver, who having audited assigned to take his account, cannot obtain of them reasonable allowances, but is sent into prison. The course in this case is to let this writ out of chancery, directed to the sheriff, to take four mainpurses to bring his body before the barons of the exchequer at a certain day, and to warn the lord to appear at the same time. F. N. B. 129.

EXPELIANT FEE, in *Law*, where lands are given to a man and his wife, and the heirs of their bodies; in which sense it differs from *fee simple*, where lands are given to a man and his wife in frank marriage, to hold to them and their heirs.

EXPELIANCY, *estates in*, are of two sorts; one created by act of the parties called a *REMAINDER*; the other by act of law, called a *REVERSION*.

EXPECTATION, in the *Doctrine of Chances*, is applied to any contingent event, and is capable of being reduced to the rules of computation. Thus, a sum of money in expectation, when a particular event happens, has a determinate value before that event happens; so that if a person is to receive any sum, e. g. 100. when an event takes place, which has an equal probability of happening and failing, the value of the expectation is half that sum, or 50. and in all cases, the expectation of obtaining any sum is estimated by multiplying the value of the sum expected by the fraction, which represents the probability of obtaining it. The expectation of a person who has three chances in five of obtaining 1000, is equal to $\frac{3}{5} \times 1000$ or 600, and the probability of obtaining 1000, is this case is equal to $\frac{3}{5}$.

If the obtaining of any sum requires the happening of several events that are independent on each other, the

value of the expectation of that sum is found by multiplying together the several probabilities of happening, and by multiplying the product by the value of the sum expected. E. g. Suppose, that in order to obtain 400, two events must happen, one of which has three chances to happen, and two to fail, and the other has four chances to happen, and five to fail; the value of the expectation is $\frac{3}{7} \times \frac{4}{9} \times 400 = \frac{16}{9} \times 400 = \frac{6400}{9} = 711 \frac{1}{9}$. For if the first event had actually happened, the value of the expectation, depending solely on the second event, would be $\frac{4}{9} \times 400 = 177 \frac{1}{9}$; and therefore the happening of the first event is the condition of obtaining an expectation worth 400, but the probability of the first happening is $\frac{3}{7}$, and the expectation sought for is evidently worth $\frac{3}{7} \times 400 = 171 \frac{1}{7}$. The rule will be the same if an expectation depends on the happening of one event and the failing of another; and also on the failing of two events; and on the happening or failing of any number of events that may be assigned. It is here supposed that the events are independent, or that the happening of one neither forwards nor obstructs the happening of the other. But if two events are dependent, i. e. if they are so connected together, as that the probability of either's happening is altered by the happening of the other, the probability of their happening is the product of the probability of the happening of one of them by the probability which the other will have of happening, when the first is considered as having happened; and the *line rule* will extend to the happening of any assigned number of events; thus, in a heap of thirteen cards of the same colour, the probability of taking out the ace is $\frac{1}{13}$, and the probability of taking the ace out of another heap of the same number is $\frac{1}{12}$, and the probability of both these independent events happening will be $\frac{1}{13} \times \frac{1}{12} = \frac{1}{156}$; but the probability of taking the ace first out of a single heap of thirteen cards is $\frac{1}{13}$, and that of taking the deuce afterwards is $\frac{1}{12}$, and therefore the probability of both happening is $\frac{1}{13} \times \frac{1}{12} = \frac{1}{156}$. If a person has several expectations on several sums, the value of his expectation on the whole is the sum of his expectations on the particulars: thus, let one event be such that the probability of obtaining any sum, e. g. 90, in case it happens, may be $\frac{1}{2}$, in which case the value of the expectation is $\frac{1}{2} \times 90 = 45$. Let the probability of another event, on which depends a second sum of 40, be $\frac{1}{4}$, and the value of the expectation in this case is $\frac{1}{4} \times 40 = 10$, and the value of the expectation on the whole $45 + 10 = 55$. But if a person is to receive 90, once for all for the happening of one or other of the two forementioned events, then, the expectation of the first event being worth 45, as before, yet the expectation of the second will be different; because this depends on the happening of the first, and takes place only in case the first happens to fail, the probability of which is $\frac{1}{2}$; and on the supposition of its having failed, the expectation of the second will be 40; therefore, $\frac{1}{2}$ is the measure of the probability of obtaining an expectation worth 40, and consequently the expectation will be worth $\frac{1}{2} \times 40 = 20$, and the value of the expectation on the whole will be $45 + 20 = 65$. See the farther illustration and application of these principles and rules in *De Moivre's Doctrine of Chances*, edit. 3. 1776. See *GAMING*.

EXPECTATION OF LIFE, in the *Doctrine of Life-annuities*, denotes, according to the most obvious sense of the term, that particular number of years which a life of a given age has an equal chance of enjoying, or the time which a person of a given age may justly expect to continue in being. But Mr. Simpson has shown, that this period does not coincide with what the writers on annuities call the *expectation of life*, except on the supposition of an uniform decrease in the probabilities of life; and Dr. Price adds, that even on this supposition, it does not coincide with what is called the *expectation of life*, in any case of joint lives; for two lives of 40 have an even chance, according to M. De Moivre's hypothesis, (see *COMPLEMENT of life*) of continuing together only 131 years. According to that hypothesis, the probability that a life aged 40 will continue 131 years, will be expressed by $\frac{32.5}{40}$, and this fraction multiplied by itself is the probability that two lives of this age shall both continue 131 years; i. e. $\frac{32.5}{40} \times \frac{32.5}{40} = \frac{1056.25}{1600} = \text{near } \frac{1}{2}$, which represents an even chance; but the expectation of two joint lives being (according to the same hypothesis) always a third of the common complement, will be in this case 131 years. Therefore, the *expectation of life*, or as it may be otherwise called, the *share of life due to a person*, is used to signify the mean continuance of any given single, joint, or surviving lives, according to any given table of observations; or the number of years which, taking them one with another, they actually enjoy, and

may be considered as sure of enjoying, so that if 46 persons are alive, all 46 years of age, and one be supposed to die every year, according to Mr. De Moivre's hypothesis, till they are all dead in 46 years, half 46 or 23 will be their *expectation of life*, i. e. the number of years enjoyed by them all will be just the same as if every one of them had lived 23 years, and then died; so that supposing no interest of money, there would be no difference in value between annuities payable for life to every single person in such a set, and equal annuities payable to another equal set of persons of the same common age, supposed to be all sure of living just 23 years, and no more.

In like manner, the third of 46 years, or 15 years and a month, is the *expectation* of two joint lives both 46; and this is also the *expectation* of the survivor. The *expectation of life*, in this last sense of the term, coincides with the sums of the present probabilities, that any given single or joint lives shall attain to the end of the first, second, third, &c. moments, from this time to the end of their possible existence; or (in the case of survivorship) with the sum of the probabilities, that there shall be a survivor at the end of the first, second, third, &c. moments, from the present time to the end of the possible existence of survivorship. From these principles Dr. Price has shown how to deduce the demonstration of Mr. De Moivre's rules for finding the *expectations of lives*, which he has omitted; we shall here subjoin them for the information and amusement of our mathematical readers. Let x stand for a moment of time, and n be the com-

PLEMENT of any assigned life; then $\frac{n-x}{n}$, $\frac{n-2x}{n}$,

$\frac{n-3x}{n}$, &c. will be the present probabilities of its continuing to the end of the first, second, third, &c. moments; and $\frac{n-x}{n}$ the PROBABILITY of its con-

tinuing to the end of x time; therefore, $\frac{n-x}{n} \times x$ will be the fluxion of the sum of the probabilities, or of an area representing this sum, whose ordinates are $\frac{n-x}{n}$, and axis x . The fluent of this expression, or

$x - \frac{x^2}{2n}$, is the sum itself for the time x ; and this, when $x = n$, becomes $\frac{1}{2}n$, the *expectation* of the assigned life, or the sum of all the probabilities just mentioned for its whole possible duration. Thus, $\frac{n-x}{n} \times \frac{n-x}{n}$,

or $\frac{n-x}{n}$, is the probability that two equal joint lives

will continue x time, and $\frac{n-x}{n} \times x$ will be the fluxion of the sum of the probabilities; the fluent of which, or $x - \frac{x^2}{2n} + \frac{x^3}{3n^2}$, becomes, when $x = \frac{n}{2}$, $\frac{n}{3}$, or the *expectation* of two equal joint lives. Again, since

$\frac{n-x}{n} \times \frac{n-2x}{n}$ is the probability that there will be a survivor of two equal joint lives at the end of x time, $\frac{n-x}{n} \times \frac{n-2x}{n} \times x$ will be the fluxion of the sum of the

probabilities; and the fluent, or $\frac{n}{6} - \frac{2x^2}{3n} + \frac{x^3}{3n^2}$, when $x = \frac{n}{2}$, $\frac{1}{3}n$, or the *expectation* of survivorship between two equal lives, which appears to be equal to the *expectation* of their joint continuance. The *expectation* of two unequal joint lives found in the same way is $\frac{m}{2} - \frac{m^2}{6n}$, m being the complement of the oldest life, and n the complement of the youngest. The whole *expectation* of survivorship is $\frac{n}{3} - \frac{m}{2} + \frac{m^2}{3n}$, and the *expectation* of survivorship of the oldest

will be to that of the youngest as $\frac{m}{n} - \frac{m^2}{2n} + \frac{m^3}{3n^2}$ to $\frac{n}{3} - \frac{m}{2} + \frac{m^2}{3n}$.

From the definition already given of the *expectation of life*, it follows, that if in a society limited to a fixed number of members, a 25th part of its members dies annually, 25 would appear to be their common *expectation of life* at the time they entered; and if it were found in any town or district, where the number of births and burials are equal, that a 20th or 30th part of the inhabitants die annually, it would appear that 20 or 30 was the *expectation* of a child just born in that town or district.

Having a table of observations, shewing the number that die annually at all ages out of a given number alive at

those ages, it is easy to find the *expectation* for all single lives by the following rule: divide the sum of all the living in the table at the age whose *expectation* is required, and at all greater ages, by the number in the table of the living at that age, and subtract half unity from the quotient, the remainder will be the *expectation* required.

The reason of this subtraction may be understood by conceiving the recruit necessary to supply the waste of every year to be made always at the end of the year, so that the dividend ought to be the medium between the number living at the beginning and the end of the year; and therefore it should be taken less than the sum of the living in the table at and above the given age by half the number that die in the year; but as the divisor is to the dividend as unit to the quotient, the subtraction here directed will have the same effect as the above-mentioned diminution. This rule may be illustrated by taking the sum of all the living at 20 and upwards in Tab. I. and dividing it by 360, the number living at that age, and the quotient less half unity, will be nearly 28.9 the *expectation* of 20 in Tab. II.

TABLE I.

Shewing the Probability of the Duration of Life in London, deduced by Mr. Simpson from Observations on the Bills of Mortality in London for Ten Years, from 1728 to 1737:

Age	Persons living	Deaths	Age	Persons living	Deaths	Age	Persons living	Deaths
0	1000	120	47	311	6	84	135	6
1	680	133	48	175	7	55	120	6
2	547	51	49	308	7	35	123	6
3	490	27	50	301	7	17	117	5
4	409	17	51	204	8	12	112	5
5	451	12	52	158	8	7	107	5
6	440	10	53	141	8	5	102	5
7	430	10	54	125	8	4	97	5

85	114	115	12	2	2

Dr. Price has applied his reasoning on this subject to the solution of a curious question in political arithmetic, or to determine the number of inhabitants in any place from a table of observations, or the bills of mortuary, for that place, on the supposition that the yearly births and burials are equal. To this purpose, find by the table the *expectation* of an infant just born; and this, multiplied by the number of yearly births, will be the number of inhabitants.

It appears from Tab. I. that though an infant just born in London has not an equal chance (the probability being $\frac{1}{21}$) of living 3 years, his *expectation* is 30 years. The medium of the yearly births in London for 20 years from 1759 to 1768 was 157,700, multiply 157,700 by 30, and the product, viz. 4,731,000 will be the number of inhabitants in London, according to the bills, if the yearly births were no more than equal to the burials, or there were no supply of inhabitants from the country; but, during the forementioned period, the burials were at an average 22,956, and exceeded the childrenings 7,246, which excess gives the annual supply from other parts; and if each of these have an *expectation* of 30 years, or they are all of the age of 18 or 20, when they remove to London, multiply 30 by 7,246, and the product, viz. 217,380 must be added to 4,731,000, and the sum, or 4,948,380 gives the number of inhabitants, supposing that the bills are perfect: but this is certainly not the case; the number both of births and burials is for many obvious reasons too small. If the annual defects in births and burials were 6000, then $20 \times 6000 = 120,000$ must be added to 4,948,380, and the whole number of inhabitants would be 5,068,380. If the burials are deficient only two-thirds of this number or 4000, and the births the whole of it, 20×6000 must be added to 4,948,380, on account of the defects in the births; and the excess of the burials being then only 5246, $30 \times 5246 = 157,380$ must be added on this account; and the number of inhabitants will be 5,225,760. If the *expectation* of life in London be diminished to 18 or 17, this number must be reduced; and Dr. Price concludes on the whole, from a great variety of observations, that

591,580 is nearest to the true number of inhabitants; though Dr. Brakenridge, allowing 6 to a house, makes the number of inhabitants in London 751,800; but the allowance of 6 to a house is certainly too large, as Dr. Price has shewn in a variety of instances from actual surveys; and he observes, that though 5 persons to a house may not be much too small an allowance for London, it is too large for England in general. If the number of houses in England and Wales be reckoned a million, the number of people will be 41 millions, allowing 41 to a house, and 5 millions, allowing 5 to a house. In the year 1690, the number of houses, according to Dr. Davenant, was 1,370,215; at the Restoration it was 1,330,000; in 1759, 986,484; in 1766, 980,692; so that between the Restoration and Revolution the people of England increased above 500,000; since the year 1690, they have decreased near a million and a half. The number of houses in Ireland in 1754 was 335,439; in 1767, it was 422,640; and allowing 41 to a house, the number of people in Ireland was 1,734,904, and if a million and a half are supposed to Scotland, the number of people in Great Britain and Ireland will be about 8 millions. Dr. Moore's *Dissertation* of Chances applied to the Valuation of Annuities, p. 238, &c. Simpson's *Selected Exercises*, p. 253, &c. and particularly Dr. Price's *Observations* on Reversionary payments, vol. i. p. 168, &c. p. 364, &c. 374, &c. or Phil. Trans. vol. ix. p. 89. See LIFE-ANNUITY, MORTALITY, SURVIVORSHIP. EXPECTATIVE, in the *Canon Law*, a hope founded on a promise of obtaining the next benefice that shall become vacant, or a right to the reversion of the next. See BENEFICE.

EXPECTATIVE CANON. See CANON.

EXPECTATIVE GRANT, *Gratia EXPECTATIVE*, called also *prebendatus*, were built frequently given by the popes or kings for future benefices. The bishops were exceedingly mortified with them, because they encroached on their privileges; besides, that such *expectatives* are odious, as they induce people to wait for the death of others. The use of *expectatives* is very ancient, though it was not near so frequent in the first ages as afterwards. Originally they were no more than simple requests made on the part of kings or popes, which the bishops consented to with the more willingness, as they only presented to them persons fit to serve the church; but the frequent exercise of this privilege made it at length be deemed a matter of obligation and necessity.

The council of Trent annulled all *expectatives*; but the canons relating thereto were never admitted in France, where the right of conferring *expectative* graces is looked on as one of the regalia.

EXPECTORANTS, in Pharmacy, are medicines that promote EXPECTORATION.

As all substances which promote excretion do not operate in the same manner, since some render the matter moveable, and dispose it for evacuation; others open the membranes, that it may be separated from the juices; and others stimulate the vessels and ducts to an excretory motion; so *expectorants* operate in the same variety. *Ways* for it the humour secreted be thin and acid, and the pores of the glands from which it is to be thrown be too much constricted, these medicines are to be given to promote expectoration, which relax, soften, and widen the passages, obtund the acrimony of the humours, and to dissipate the too thin and fluid parts of them. To this purpose liquorice-root, licorice, *Elæon*, mallow, red popper, oil of almonds, and the Symplic pill, may be given; but when a large quantity of thick and viscid matter is lodged in the bronchia of the lungs, and impedes respiration, then some stimulus to respiration becomes necessary, and expectoration must be assisted by substances which can resolve the tough and viscid matter. For this purpose decoctions of iaculous and the other pectoral herbs with the *serra foliata tartari*, solutions of crabs eyes, and animated *vitre*, are very proper. The nervous coats of the bronchia are also stimulated to an excretory motion by a certain acid, suble, and acous principle, found in gum ammoniac and benjamin, and the like stimulating gums.

The roots of elecampane, and Florentine orris also, and all the preparations of sulphur, serve excellently to this purpose; and where a yet stronger stimulus is required, as in a pituitous asthma, ornyel of squills, and the spiritali ammoniac, which is prepared with gum ammoniac and crystals of copper, are found remedies of very great power. Great caution is necessary in the exhibition of *expectorants*, and the practitioner who gives the common medicines, known by that name at random, and without informing himself thoroughly of the nature of the case, is likely to do great mischief instead of good by them. In coughs of the moist and chronic kind, as also in a pituitous asthma, in which large quantities of phlegm

phlegm fall into the bronchia of the lungs, sweet substances, liniments, and oily medicines, weaken the stomach, whose strength and tone are already too much impaired, diminish the appetite, digestion, and chylification, and not only promote the generation of more tocrementitious matter, and the increase of the disease, but also dispose the patient to a cachexia, or to oedematous tumors, or a dropsy. In these cases, it is therefore much more proper to use balsamic pectorals, and such as are grateful to the stomach. Holm. Med. Ration. Syll. *Expectorants* ought to be cautiously used in a phthisis, in spitings of blood, and in dry coughs, difficulties of breathing, and violent pains in the breast, which rather arise from a congestion of blood than from matter to be expectorated, and *expectorants*, whether of the laxative or of the stimulating kind, must certainly add to the congestion of the blood and humours, rather than to the relief of the patient.

In pleuritis and peripneumonia, *expectorants* are to be very cautiously used in the beginning, lest by their means the inflammatory stagnation of the blood should be increased; but when these disorders are upon the decline, and the greater part of the inflammatory matter is dissolved, then they are very properly and commodiously used to draw the viscid and concocted matter out of the pulmonary crasis.

EXPECTORATION, of *ex, vti, and pectus, breast*, the act of evacuating or bringing up phlegm or other matters out of the trachea, lungs, &c. by coughing, hawking, spitting, &c. See COUGH.

Expectoratum cures the lungs of the viscid or purid matters which obstruct their vessels, and fructifies the breast.

EXPEDITATION, in the *Forst-lotus*, signifies a cutting out the balls of a dog's fore-feet for the preservation of the king's game.

Every one that keeps any great dog, not *expeditated*, forfeits three shillings and fourpence to the king. In mastiffs, not the ball of the feet, but the three claws are to be cut to the skin. Instit. partiv. p. 308. *Nullo Dominici canis abbas & monachus expeditati caput.* Chart. Hen. III. *Et sic quicquid de expeditatis canum.* Ex. Mag. Rot. Fig. de ann. 9 Ed. II.

This *expeditation* was to be performed once in every three years, and was done to every man's dog who lived near the forest, and even the dogs of the foresters themselves.

EXPEDITION, the march of an army to some distant place, with a view of hostilities.

Such were the *expedition* of Cyrus against Xerxes, and of Bacchus and Alexander from the Indies.

Expeditio for the recovery of the Holy Land were called **CROSSADES**.

EXPENSES, in *Book-keeping*. See BOOK OF EXPENSES.

EXPENDITORS, in *Law*, are the persons appointed by commissioners of sewers, to pay, disburse, or expend the money collected by the tax for the repairs of sewers, &c. when paid into their hands by the collectors on the reparations, amendments, and reformations ordered by the commissioners, for which they are to render accounts when required for that purpose.

These officers are mentioned in the statute 37 H. VIII. cap. 11, and other statutes. The reward who superintends the repair of the dykes and water-courses in Romney-March, is likewise called the *expeditor*.

EXPENSIS militum levandi, was a writ anciently directed to the sheriff, for levying allowance for the knights of parliament. See PARLIAMENT, and REPRESENTATIVE.

EXPENSIS militum non levandi, &c. in *Law*, an ancient writ to prohibit the sheriff from levying any allowance for knights of the shire upon those that hold lands in ancient demesne. Reg. Orig. 261.

EXPERIENCE, a kind of knowledge acquired by long use, without any teacher.

Experientia consists in the ideas of things we have seen or read, which the judgment has reflected on, to form for itself a rule or method.

Authors make three kinds of *experience*: the first is the simple uses of the external senses, whereby we perceive the phenomena of natural things, without any direct attention thereto, or making any application thereof.

The second is, when we premeditatedly and designedly make trials of various things, or observe those done by others, attending closely to all effects and circumstances. The third is that preceded by a foreknowledge, or at least an apprehension of the event, and determines whether the apprehension were true or false; which two latter kinds, especially the third, are of great service in philosophy.

EXPERIMENT, in *Philosophy*, a trial of the effect or result of certain apprehensions and motions of natural bodies, in order to discover something of the laws and relations

thereof, or to ascertain some phenomenon, or its cause.

The schoolmen define *experiment*, a comparison of several things before observed by the senses, and retained in the memory in some one similar convenient instance.

The nature of *experiment*, therefore, according to them, consists in comparing several things by one act; whence they distinguish two things in every *experiment*, the one *material*, viz. the several ideas remembered; the other *formal*, viz. the comparing of these ideas in the mind.

This will be illustrated by an example: a physician gives a quantity of rhubarb to ten several persons, and remembers each of them. Now, coming afterwards to compare the several remembrances together, and finding the effect of the exhibition of rhubarb to be the same in all, viz. a purging; this is an *experiment* of rhubarb.

The making of *experiments* is grown into a kind of formed art, and we now abound in systems of *experiments*, under the denomination of *systems of experimental philosophy*. Stürmius has made a curious collection of the principal discoveries and *experiments* of the last age, under the title of *colligium experimentum*. Dr. Delagatius has also published a comprehensive and useful compendium of *experimental philosophy*. The chemists choose to call their *experiments*, by way of distinction or eminence, *probes* or *specifications*.

EXPERIMENTAL Philosophy, by the Greeks called *empeiria*, or *empeirika*, is that which proceeds on *experiments*, or which deduces the laws of nature, and the properties or powers of bodies, and their actions upon each other, from sensible *experiments* and observations.

Experiments are of the utmost importance in philosophy, and the great advantage the modern physics have above the ancient, is chiefly owing to this; that we have a great many more *experiments*, and that we make more use of the *experiments* we have.

The way of philosophizing was to begin with the cause of things, and argue to the effects and phenomena; ours, on the contrary, proceeds from *experiments* and observations alone.

Lord Bacon first raised this way for the new philosophy, by setting on foot the building of *experimentum*. His method has been perfected with little emulation by the Academy of Cimento, the Royal Society, Newton Academy at Paris; and by Mr. Boyle, Sir Isaac Newton, and many others.

In effect, *experiments* within the last century, are come into such a vogue, that nothing will pass in philosophy but what is founded on, or confirmed by, *experiments*; so that the new philosophy is almost altogether *experimental*. Indeed, the ancients, whatever we commonly say to the contrary, seem to have thought as well of the *experimental* way as the moderns. Plato mixes no occasion of speaking of the advantages of the *experimental*; and as to Aristotle, his History of Animals may bear witness for him. Democritus's great business was to make *experiments*; and even Epicurus himself owes part of his glory to the same cause. Plato calls it, in respect to its object, *κατασκευαστική, fabulatio* of *factio*.

Yet there are some, even among the learned, who conceive of *experiments* in a different manner. Dr. Keil allows, that philosophy has received very considerable advantages from the makers of *experiments*; but he complains of their dissimilarity, in too often wrangling and dissenting their *experiments* and observations to favour some darling theories they had espoused; but this is not all. Mr. Hartlebury, in his Recueil de philosophes. Pieces de Physique, undertakes to shew, they who employ themselves in the making of *experiments* are not properly philosophers, but, as it were, the labourers or operators of philosophers, who work under them, and for them, furnishing them with materials to build their systems and hypotheses upon.

The learned M. Dacier, in the beginning of his discourse on Plato, at the head of his translation of the works of that philosopher, deals still more severely with the makers of *experiments*. He breaks out with a sort of indignation at a tribe of silly curious people, whose sole employ consists in making *experiments* on the gravity of the air, the equilibrium of fluids, the loadstone, &c. and yet arrogate to themselves the noble title of philosophers. See PHILOSOPHY and PHYSICS. See also ANALYSIS and SYNTHESIS.

EXPERIMENTUM Crucis, denotes a capital, leading, or decisive experiment; thus called, either, because like a cross or disclonipoll, placed in the meeting of several roads, it guides and directs men to the true knowledge of the nature of the thing they are enquiring after; or, as it is a kind of torture, whereby the nature of the thing is, as it were, extorted by violence.

EXPIATION, the act of suffering the punishments adjudged to a man's crimes, and thus paying off, or discharging the debt or guilt; and it is figuratively applied

to the pardon procured for the sins of the penitent by the intercession and death of Christ.

The Romanists hold, that souls after death are sent to purgatory to expiate or atone for their sins.

EXPIATION is also applied to sacrifices offered to the Deity, to implore his mercy and forgiveness.

EXPIATION, the *feast of*, among the Jews, called by our translators the *day of atonement*, was held on the tenth day of Tisri, or the seventh month of the Jewish year, answering to part of our September and October. It was instituted by God himself, Levit. xvi. 27, &c. On that day the high-priest, the figure or type of Jesus Christ, entered into the most holy place, and confessed his sins; and, after several ceremonies, made an atonement for all the people to wash them from their sins. Lev. chap. xvi. See *SEASONS*.

EXPIATION, among the *Heathens*, denoted a purification offered for effacing or abolishing a crime, averting any calamity; and on a thousand other occasions, as purifying towns, temples, and sacred places, and armies, before and after battle.

It was practised with divers ceremonies: the most usual was abstinence.

Expiations were performed for whole cities as well as particular persons. After the young Horatius had been absolved by the people from the murder of his sister, he was farther purified by several expiations prescribed by the laws of the pontifices for involuntary murders. Halicarnass.

EXPIATION, from *expiis*, *I rob*, in the *Civil Law*, the act of withdrawing or diverting something belonging to an inheritance, before any body had declared himself heir thereof.

This made a peculiar species of theft; for there could not properly be a theft in taking a thing not possessed by any body, or before the inheritance was accepted.

For this reason the Roman legislature introduced the action of *expilatio* for the punishment of this crime.

Beside this meaning, it was used in a more special manner, to signify a robbery committed by night; whence an *expilator* was looked upon as a greater criminal than a common thief.

The *expilator* were so called from their robbing and stripping people of their clothes.

EXPIRATION, in *Medicine*, that motion in an animal whereby the air inspired into the lungs is expelled or thrown out of the frame, and the cavity of the breast contracted.

Respiration consists of two alternate motions or actions of the lungs, corresponding to those of a pair of bellows: inspiration, whereby the air is drawn in; and expiration, whereby it is driven out again.

By the means of this alteration, the circulation of the blood, and the motion of the heart, are maintained.

EXPIRATION is also used figuratively, for the end of a term of time granted, agreed on, or adjudged.

EXPLEES, in *Law*, the *reus* or profits of an estate, &c. See *EXPLEES*.

EXPLICATIVE Proposition, in *Logic*. See *COMPLEX Proposition*.

EXPLICIT, in the *Schools*, something clear, distinct, formal, and unfolded.

The will or intention is said to be *explicit* when it is fully explained in proper terms; and *implicit*, when it is only to be learnt by deductions and consequences.

The Jews had not all an *explicit* knowledge of Jesus Christ, but they had at least an *implicit* one.

Such a teller has declared his will *explicitly*, i. e. in formal terms; there is no need to have recourse to explications.

EXPLOSION, from *explere*, *I drive away with noise*, in *Physics*, the act of a thing which drives another away out of the place it before possessed.

The term is chiefly used for the going off of gunpowder, and the expulsion of the ball, shot, or the like consequent thereon.

Hence, *explosion* comes likewise to be figuratively used to express such sudden actions of bodies as have some resemblance to these; e. g. those which ferment with violence, immediately upon their mixture, and occasion a cracking sound.

EXPOLIATION, in *Rhetoric*, a figure whereby we explain the same thing in different phrases and expressions, in order to throw it more fully.

Expoliation was the favourite figure of Balzac.

EXPONAS *Vindictis*. See *VENDITION*.

EXPONENT, from *expono*, *I express*, in *Arithmetic*. *Exponent* of a power denotes the number which expresses the degree of the power, or which shews how often a given power is to be divided by its root before it be brought down to unity.

Thus, the *exponent* or index of a square number is 2; of Vol. II. N° 122.

a cube, 3; the square being a power of the second degree; the cube, of a third, &c.

Exponents are commonly written above, and somewhat towards the right-hand of the number or quantity whose power they express. Thus, 3^5 , 4^3 , signifies the fifth power of 3, and of 4. See *POWER*.

EXPONENT is also used in *Arithmetic*, in the same sense with index or logarithm.

Thus a series of numbers in arithmetical progression being placed under another series in geometrical progression, are called the *exponents*, *indices*, or *logarithms*, thereof. E. g. in the two progressions.

Geom. 1, 2, 4, 8, 16, 32, 64, 128, 256, 512
Arith. 0, 1, 2, 3, 4, 5, 6, 7, 8, 9

0 is the *exponent*, index, or logarithm, of the first term 1; 5 that of the sixth, 32, &c.

Hence, unity is to the *exponent* of a power as the logarithm of the root to the logarithm of its power; consequently, the logarithm of the power is had by multiplying the logarithm of the root by its *exponent*; and the logarithm of the root is had by dividing the logarithm of the power by its *exponent*.

EXPONENT of a ratio, is the quotient arising upon dividing the antecedent by the consequent.

Thus, in the ratio 3 to 2, the *exponent* is $\frac{3}{2}$, and the *exponent* of the ratio 2 to 3 is $\frac{2}{3}$. See *RATIO*.

Hence, 1. If the consequent be unity, the antecedent is the *exponent* of the ratio. Thus, e. g. the *exponent* of the ratio 4 to 1, is 4; and again, the *exponent* of a ratio is to unity as the antecedent to the consequent.

2. Since, in a rational ratio, the *exponent* of a ratio is had by dividing a rational number by another rational, the *exponent* of a rational ratio is a rational number.

EXPONENTIAL Calculus, *Calculus EXPONENTIALIS*, is a method of differencing *exponential* quantities, and of summing up the differences of *exponentialis*. See *CALCULUS*.

EXPONENTIAL curve, is that which is defined by an *exponential equation*.

Exponential curves partake both of the nature of algebraic and transcendental ones; of the former, because they consist of a finite number of terms, though those terms themselves are indeterminate; and of the latter, because they cannot be algebraically constructed, or represented by an algebraic equation. Thus, $y = a^x$ is the equation of an algebraic curve; $y = a^x$ is the equation of an *exponential curve*: this equation $y = a^x$ denotes that any ordinate y is to a constant ordinate assumed equal to 1, as a constant quantity a raised to a power whose exponent expresses the ratio of the abscissa x to the line equal to 1. It is to the line taken for unit or 1, raised to the same exponent. Let b represent the line = 1, and the equation $y = a^x$, (since $y : b :: a^x : b^{\frac{x}{b}}$) will become $\frac{y}{b} = \frac{a^x}{b^{\frac{x}{b}}}$.

Note, $y = a^x$ is the equation of the LOGARITHMIC curve.

EXPONENTIAL equation, is that wherein there is an *exponential* quantity. See *EQUATION*, &c.

EXPONENTIAL quantity, is a power whose *exponent* is an indeterminate, or variable quantity.

Exponential quantities are of several degrees and orders: when the *exponent* is a simple indeterminate quantity, it is called an *exponential of the first, or linear degree*.

When the *exponent* itself is an *exponential of the first degree*, then the quantity is an *exponential of the second degree*. Thus, 2^x is an *exponential of the first degree*, because the

quantity y is a simple flowing quantity; but 2^x is an *exponential quantity of the second degree*; because y^x is

an *exponential of the first degree*; so also, 2^x is an *exponential of the third degree*, the *exponent* y^x being one of the second; and universally, the *exponential* quantity of any degree has for its *exponent*, the *exponential quantity* of any degree next preceding it. See *Bernoulli Oper. tom. 1. p. 182, &c.*

EXPORTATION, in *Commerce*, the act of sending commodities out of one country into another.

Exportation is a part of foreign *commerce*, distinguished by the appellation *active*, or *selling part*, in opposition to *importation*, which is called the *passive*, or *buying part*. It is observed as a general maxim, that commerce, when active, must produce a flow of riches, the balance being received in money; whereas, if it be passive, treasures will be exhausted, as the *balance of trade* must continually be made good out of the remaining coin. Hence plenty of money in any place implies, that the quantity of goods exported far exceeds that of goods imported: and

and wherever money is scarce, it may be concluded, that private quantities of goods have been imported than exported. See EXCHANGE.

The merchandises yearly exported from England are iron, lead, tin, leather, coal, hops, flax, hemp, hats, mal-linens, fish, watches, ribbons, &c.

Wool, taller's earth, &c. are contraband goods, i. e. they are prohibited to be exported. For the duties of exportation, see DUTY.

EXPOSING, the act of setting a thing to public view.

In the Romish church, the sacrament is said to be *exposed* when it is shown in public, uncovered, on festival days, and during the time of plenary indulgences.

EXPOSING is also used with a farther latitude; thus, we say, it is prohibited to *expose* false and clipped money.

Such a house stands very high, and has a delicious prospect; but it is *exposed* to all the four winds. Such a city being on the frontiers, and not fortified, is *exposed* to the insults of every party of forces.

Exposing of children, a barbarous custom practised by most of the ancients, excepting the Thebans, who had an express law to the contrary, whereby it was made capital to expose children, *estimating* at the same time, that such as were put in a condition to educate them should bring them to the magistrates, in order to be brought up at the public expence. For Archæol. Græc. tom. ii. p. 333. Among the other Greeks, when a child was born, it was laid on the ground; and if the father desired to educate his child, he immediately took it up; but if he forbore to do this, the child was carried away, and *exposed*. Pellic. Lex. Ant. in voc. *Expositus*.

The Lacedæmonians, indeed, had a different custom; for, with them, all new-born children were brought before certain tyers, who were some of the gravest men in their own tribe, by whom the infants were carefully viewed; and if they were found lully and well-favoured, they gave orders for their education, and allotted a certain proportion of land for their maintenance; but if weakly, or deformed, they ordered them to be cast into a deep cavern in the earth, near the mountain Taygetus, as thinking it neither for the good of the children themselves, nor for the public interest, that defective children should be brought up.

Many persons *exposed* their children only because they were not in a condition to educate them, having no intention that they should perish. It was the unhappy fate of daughters especially to be thus treated, as requiring more charges to educate and fettle them in the world than sons.

The parents frequently tied jewels and rings to the children they *exposed*, or any other thing whereby they might afterwards discover them, if Providence took care for their safety. Another design, in adorning these infants, was either to encourage such as found them to nourish and educate them, if alive; or to give them human burial, if dead.

The places where it was usual to *expose* children were such as people frequented most. This was done in order that they might be found, and taken up by compassionate persons who were in circumstances to be at the expence of their education. With this intention the Egyptians and Romans chose the banks of rivers, and the Greeks the highways.

EXPOSITION, the act of *exposing*. See EXPOSING.

EXPOSITION is likewise applied to the interpretation or explication of an author, or passage therein. See EXEGETIC.

EXPOSITION, *expositio*, in Rhetoric, is sometimes used for division. See DIVISION; and see also EXERGASIA.

EXPOSITION, in Gardening. See EXPOSURE.

EXPOSTOR, or EXPOSTORY, a title which some writers have given to a lesser kind of dictionaries or vocabularies, tending to expound or explain the meaning of the obscure or difficult words of a language.

It is also used in the same sense with COMMENTARY and PARAPHRASE.

EX POST FACTO, in Law, denotes something done after another thing that was committed before. An estate granted may be made good by matter *ex post facto*, that was not in at first, by election, &c.

EXPOSTULATION, *expositulatio*, in Rhetoric, a complaint addressed to a person from whom we have received some injury. It varies according to circumstances.

EXPOSURE, or EXPOSITION, in Gardening, the aspect or situation of a garden wall, building, or the like, with respect to the sun, wind, &c.

There are four regular kinds of *exposures*, viz. *east*, *west*, *north*, and *south*; but it must be observed, that among gardeners these terms signify just the contrary to what they do among geographers.

The gardeners, in effect, do not give the names *east*,

west, &c. to the places where the sun is, but to those whereon he shines; and they consider the manner wherein he shines, whether as to the whole garden, or some of its sides.

If they find, that the sun at his rising, and during the first half of the day, continues to shine on one side of a garden or wall, they call that an *eastern exposure*, or *east wall*, &c. and if the sun begin to shine later, or end sooner, it is not a proper *eastern exposure*.

For the same reason, they call the *west* the side the sun shines on in the latter half of the day; i. e. from noon to night; and accordingly, the *south*, or *southern exposure*, is the place whereon he shines from about nine o'clock in the morning till night; or which, in the general, he shines longest on in the whole day; and the part he shines least on is the *north*, or *northern exposure*, at what hour soever it begin or end, being usually from eleven o'clock to one.

The *eastern* and *southern exposures* are, by common consent of all gardeners, the two principal, and have a considerable advantage above the rest. A *west exposure* is not much amiss; at least, it is better than a northern one, which in the world of all each has its inconveniences.

The eastern, commencing differently at different seasons of the year, and ending about noon, subjects the trees, &c. to the N.E. winds, which wither the leaves and new shoots, blow down the fruit, &c. beside that it has little benefit of rains, which come mostly from the west. Yet does the reverend Mr. Laurence judge the east better than the west-wall for all kinds of fruit; not that it has more hours of sun, or that there are any peculiar virtues in the eastern rays, but because the early rays of the sun do sooner take off the cold chilly dews of the night.

M. Gentil recommends the *east exposure* as best for all kinds of peaches; adding, that they grow sooner, grow bigger, are better coloured, and more fruitful, than in any other; but Mr. Laurence is against the rule to the early and warm rays of the sun, and he rather chooses a *west exposure*, which is best for all late fruits, and the influence of the sun is strongest, and continues longest.

The *western exposure* is from half an hour past eleven till sunset, is not warmer than an *eastern* one by eight or ten days; but it has this advantage, that it receives little damage from the frosts, which melt before the sun comes to shine upon the fruit, and fall off like dew, without doing any prejudice; so that it may bear apricots, peaches, pears, and plums; but it is incommenced with north-west winds in the spring, as also with the autumnal winds, which blow down a great quantity of fruit.

According to Mr. Miller, the best aspect of *exposure* for walls in England is the point to the eastward of the south, because those will enjoy the benefit of the morning sun, and be less exposed to the west and north-west winds, which are very injurious to fruits in England, than those walls which are erected due south; the next best *exposure* is due fourth, and the next to that fourth-east, which is preferable to the fourth-west. Other walls, however, may be planted with fruit-trees that suit their several *exposures*.

The *northern exposure* is the least favourable of any in England, as having very little benefit from the sun even in the height of summer, therefore can be but of little use, whatever may have been advanced to the contrary. For although many sorts of fruit-trees will thrive and produce fruit in such positions, yet such fruit can be of little worth, since they are deprived of the kindly warmth of the sun to correct their crude juices, and render them well-tasted and wholesome. It is therefore to little purpose to plant fruit-trees against such walls, except it be for fruit intended for baking, &c. in which case the fire will ripen and render those juices wholesome which could not be performed while growing.

In such situations, morell cherries for preferring may be planted, and white and red currants to come late, after those which were more exposed to the sun are gone; and if the soil be warm and dry, some sorts of summer pears will do tolerably well on such an *exposure*, and will continue longer in eating than if they were exposed to the sun. But winter pears should by no means be planted in such an aspect, as has been practised by many ignorant persons, if we find that the best fourth walls in some bad years are barely warm enough to ripen them. Duke cherries planted against walls exposed to the north will ripen much later in the season; and if the soil be warm, will be well flavoured, and continue a month later than others. Miller.

The *southern exposure*, accounted from about nine till four, is recommended for peaches, pears, grapes, and plums.

EXPRESS, something that is precise in formal terms, or for some particular design. I told him as much in *express* terms; he gave me a commission *express*; he had *express* orders; a courier was dispatched *express*. We also say, somewhat absurdly, to send an *express*, meaning a COURIER.

EXPRESSED Oils, are such as are procured from bodies only by pressing; as the oils of olives, almonds, and the like. See OIL.

EXPRESSED Spirit. See SPECIES.

EXPRESSION, in *Arithmetic*, denotes the value of a quantity expressed or represented under an algebraic form: thus if $x = \sqrt{a^2 + b^2}$, and a and b are known, the value of x is known. See EQUATION.

EXPRESSION, in *Medicine, Chemistry*, &c. the act of *expressing* or extracting the juices or oils of plants, fruits, or other matters, by squeezing, wringing, or pressing them in a press. After having let the herbs infuse a due time, their juice must be drawn by *expression* in a linen cloth, or by a press.

EXPRESSION, in *Musick*, denotes the performing of a piece of melody, or a single passage, with that energy and feeling which the poetry or passion to be impelled upon the hearer requires.

EXPRESSION, in *Oratory*, denotes the manner of delivering or conveying a man's ideas to another.

EXPRESSION is more particularly used for the ELOCUTION, diction, and choice of words in a discourse.

It is not enough that a poet or orator have fine thoughts, he must likewise have a happy *expression*. Defects in the *expression* ordinarily arise from defects in the imagination: abundance of the beauties of the ancient writers are ascribed either to *expression* which are peculiar to their language; or to relations, which, not being so familiar to us as to them, do not give us the same pleasure.

EXPRESSION, *describing of*, in *Rhetoric*. See DIVERSIFYING.

EXPRESSION, in *Painting*, denotes a natural and lively representation of the subject, or of the several objects intended to be shown.

The *expression* consists principally in representing the human body and all its parts in the action suitable to them; in exhibiting in the face the several passions proper to the figures, and observing the motions they impress on the other external parts.

The term *expression* is ordinarily confounded with that of *passion*; but they differ in this, that *expression* is a general term, implying a representation of an object, agreeably to its nature and character, and the use or office it is to have in the work; whereas *passion*, in painting, denotes a motion of the body, accompanied with certain dispositions or airs of the face, which mark an agitation in the soul. So that every *passion* is an *expression*, but not every *expression* a *passion*.

EXPRESSION in painters, laws or rules of. *Expression*, we have said, is a representation of things according to their character, and may be considered either with respect to the subject in general, or to the passions peculiar thereto.

1. With regard to the subject, it is to be observed, 1. That all the parts of the composition are to be transformed or reduced to the character of the subject, so that they may conspire to impress the same sentiment, passion, or idea; thus, e. g. in a representation of joy and peace, every thing is to appear calm and agreeable; of war, turbulent and full of terror, &c.

2. In order to this, if any circumstance occur in history or description that must invert or take from the idea, it must be suppressed, unless essential to the subject.

3. To this end the history or fable is to be well studied by the authors who describe it, in order to conceive its nature and character truly, and impress it strongly on the imagination, that it may be diffused and carried through all the parts of the subject.

4. A liberty is to be taken of choosing favourable incidents, in order to diversify the *expression*, provided they be not contrary to the principal image of the subject, or the truth of history.

5. The harmony of the *test ensemble* must be particularly regarded, both with respect to the actions and the light and colour.

6. The modes and customs are to be observed, and every thing made conformable to time, place, and quality.

7. The three unities of time, place, and action, ought to be observed; that is, nothing should be represented in the same picture but what passes at the same time, and may be seen at the same view.

II. With regard to the particular passions and affections of the subject: the rules are, 1. That the passions of brutes are few and simple, and have almost all an immediate respect, either to self-preservation, or the propagation of the kind; but in men there is scope for

greater variety, and accordingly more marks and *expressions* thereof.

2. Children not having the use of reason, act much after the manner of brutes, and *express* the motions of their passions directly, and without fear or disguise.

3. Though the passions of the soul may be *expressed* by the actions of the body, it is in the face they are principally shewn, and particularly in the turn of the eye, and the motions of the eye-brows.

4. There are two ways of lifting up the eye-brows, the one at the middle, which likewise draws up the corners of the mouth, and argues pleasant motions; the other at the point next the nose, which draws up the middle of the mouth, and is the effect of grief and sadness.

5. The passions are all reducible to joy and sadness; each of which is either simple or mixed and passionate.

6. Simple joy causes a dilatation of all the parts; the eye-brows rise in the middle; the eyes half-open, and smiling, the pupil sparkling and moist, the nostrils a little open, the cheeks full, the corners of the mouth drawn a little upwards, the lips red, the complexion lively, and the forehead serene.

7. Passionate joy, proceeding from love, shews the forehead smooth and even, the eye-brows a little elevated on the side the pupil is turned to, the eyes sparkling and open, the head inclined towards the object, the air of the face smiling, and the complexion ruddy. That proceeding from desire shews itself by the body, the arms being extended towards the object, in uncertain and unquiet motions.

8. Simple sadness is *expressed* by the body being cast down, the head carelessly hanging aside, the forehead wrinkled, the eye-brows raised to the midst of the forehead, the eyes half shut, the mouth a little open, the corners downwards, the under-lip pointing and drawn back, the nostrils swelled and drawn downwards. Sadness mixed with fear causes the parts to contract and palpitate, the members to tremble and fold up, the visage to be pale and livid, the point of the nostrils elevated, the pupil in the middle of the eye, the mouth opened at the sides, and the under-lip drawn back. In that mixed with anger the motions are more violent, the parts all agitated, the muscles swelled, the pupil wild and sparkling, the point of the eye-brows fixed towards the nose, the nostrils open, the lips big, and pressed down, the corners of the mouth a little open and foaming, the veins swelled, and the hair erect. That with despair resembles the last, only it is more excessive and disordered.

9. The hand has a great share in the *expression* of our sentiments and passions: the raising of the hands conjoined towards heaven, *expresses* devotion; wringing the hands, grief; throwing them towards heaven, admiration; fainting and dejected hands, amazement and despair; holding the hand, idleness; holding the fingers indented, musing; holding forth the hands together, yielding and submission; lifting up the hand and eye to heaven, calling God to witness; waving the hand from us, prohibition; extending the right hand to any one, pity, peace, and safety; scratching the head, thoughtfulness and care; laying the hand on the heart, solemn affirmation; holding up the thumb, approbation; laying the fore-finger on the mouth, bidding silence; giving with the finger and thumb, *para dare*, or giving sparingly; and the fore-finger put forth, the rest contracted, *monstrare*, & *dicere*, to point at, and say; *hic est*, this is he.

10. The sex of the figure is to be regarded, and man, as he is of a more vigorous and resolute nature, is to appear in all his actions freer and bolder than women, who are to be more reserved and tender.

11. So also the age, the different stages whereof incline to different motions both of body and mind.

12. The condition, or honours, with which a person is invested, render their actions more reserved, and their motions more grave; contrary to the populace, who observe little conduct or restraint, giving themselves for the most part up to their passions, whence their external motions become rude and disorderly.

Lastly, in *figures* we must retrench all those corruptible things which serve only for the preservation of life, as veins, arteries, &c. only retaining what may serve for the form and beauty of the body. In angels, particularly, as being symbolical figures, we are to mark out their offices and virtues, without any draught of sensual passions, only appropriating their characters to their functions of power, activity, and contemplation.

EXPROBATION, *Exprobatio*, in *Rhetoric*, is the reproaching of a person with ingratitude, and unkindness of some particular benefit conferred upon him.

EXPULSION, the act of driving a man by force out of a city, community, or the like.

EXT

EXERUION is also used in *Medicine*, for the act of driving out a foreign body with violence from the place it was in.

The uterus has the chief office in the *expulsion* of the fetus: if the *expulsion* of the fetus happen very soon after conception, it is called a *false birth*. See **FORTUS** and **DELIVERY**.

EXPIRGATION, in *Astronomy*, is used by some authors for that state or action of the sun, wherein, after having been eclipsed and hid by the interposition of the moon, it begins to appear again.

Later astronomers call this *EMERSION*, not *expurgation*.

EXQUIMA, in *Zoology*, the name of a species of monkey common on the coast of Guinea. The hair on its back is of a reddish brown, and looks as if it had been singed or burnt, and resembles a rusty iron colour: among the hairs are a number of small white spots; its belly and chin are wholly white, and it has a very beautiful beard of a flow-white, composed of hair of two fingers length, and always lying as neatly and regularly as if it were combed. When this creature is provoked, it draws back its lips, and, showing all its teeth, thrusts its jaws very nimble, and chatters remarkably loud. It is very nimble, and leaps surprisingly: it feeds on the fruits it finds in the woods. *MAY*.

There is also another species of this creature in Guinea, of the size of the former, and of a blackish brown on the greater part of the body, but of a bluish grey on the belly, and the lower half of its tail is of a sort of tawney colour; its mouth and nose are blue, and its cheeks adorned with a multitude of yellow hairs clustered together like those of a goat's beard. Its legs and feet are wholly black, it is a sprightly animal, and skips and plays like the other. Besides these, there is also a third, of the *exquima* kind, smaller than the others, and of a mixt colour of brown, yellow, and grey: this has a long tail, a small head, and no beard.

EXSIBITANTES, in *deception*, a kind of buffets, who, in the theatre and other public auditories, used to make a noise with their feet, and even sometimes beat the seats with batons.

EXSICCATION, formed of *ex* and *succus*, dry, in *Chemistry*. See the act of drying up or evaporating the moisture of a thing.

EXSORS Particula. See **PARTICULA**.

EXSUCCATIO, a word used by some *Chirurgical Writers*, to express an *INCISION*, or incision.

EXSUFFLATION, a ceremony offered in baptism, by which the candidate was supposed to renounce the devil. See **BAPTISM**.

EXTANT, something that still subsists, or is in being.

It is but part of the History of Livy, of the writings of Cicero, Ovid, &c. that are *extant*, the rest are lost. We have nothing *extant* of Socrates, though he wrote a great deal.

EXTACY, *Ectasy*, a rapture, or removal of the mind out of its natural state and situation; or a transport, whereby a person is hurried out of himself, and the office of his senses is suspended. See **ENTHUSIASM**.

EXTACT, in *Medicine, is considered as a disease, near akin to a catalepsy, only differing from it in this, that the cataleptic patient has no perception of what passes in his paroxysm, nor any remembrance thereof when it is over; whereas the *extatic* is taken up with a very lively idea or imagination, which he remembers afterwards.*

In an *extasy*, there must be an unusual tension of the fibres of the sensor, as in most deliriums, &c.

EXTEMPORANEOUS Prescription. See **PRESCRIPTION**.

EXTEND, in the *Mechanics*. To extend a horse, is an expression used by some to import the same with making a horse go large. See **LARGE**.

EXTEND, in *Law*. See **EXTENDING**.

EXTENDERE Terra. See **TERRA**.

EXTENDENDUM Interior, in *Astronomy*, a name given by Spighius and others to a circle of the writ, called by Albion, *universi extensus*, and by Winflow and others, *universalis extensus*. See **UNIVERSALIS extensus**.

EXTENDI Facula, in *Law*, a writ of extent, whereby the value of lands is commanded to be made and levied, &c. *See Orig.*

EXTENDING, in a *Legal Sense*, signifies the valuing of lands and tenements of one bound by statute, &c. and who hath forfeited his hand at such an indifferent rate, as that by the yearly rent the obligor may in time be fully paid his debt. See **EXTENT**.

EXTENSION, in *Physics*, that whereby a thing is constituted long, broad, or thick, &c. or that property of bodies whereby they occupy a certain portion of space.

Extension is usually defined as consisting in the situation of parts beyond parts; with which some authors cavil, as

EXT

holding, that we can conceive absolute *extension* without any relation to parts.

If a man consider the distance between two bodies absolutely, and without any regard to bodies which may fill that interval, it is called *space*; and when he considers the distance between the extremes of a solid body, it is called *extension*.

Extension is frequently confounded with quantity and magnitude; and, for what we can perceive, without much harm; the thing signified by them all appearing to be the same: unless we admit a distinction made by some authors, that the *extension* of a body is something more absolute, and its quantity and magnitude more relative, or implying a nearer relation to much and little.

See **QUANTITY**, **MAJORITY**, **MASS**, and **MATTER**. The infinite divisibility of *extension* has been a famous question in all ages. It is not easy to reconcile the doctrine of mathematicians on this head, with the tenets of some philosophers. They who hold that all *extension* and magnitude are compounded of a certain number of indivisible parts, and that a line, for instance, cannot increase or decrease but by certain indivisible increments or decrements only, must consistently with themselves affirm, that all lines are commensurable to each other, contrary to the tenth book of Euclid, who demonstrates, that the diagonal of a square is incommensurable to its side. But if all lines were composed of certain indivisible elements, it is plain that of those elements must be the common measure of the diagonal and the side. This is a Gordian knot which none of the philosophers have yet thought fit to untie.

Bishop Berkeley observes, that the infinite divisibility of *extension*, though it is not expressly laid down either as an axiom or theorem in the elements of geometry, yet is throughout the same every where supposed, and thought to have so inseparable and essential a connection with the principles and demonstrations in geometry, that mathematicians never admit of its doubt, or make the least question of it. And he observes, that the source from whence do spring all those absurd geometrical paradoxes, which have been so often repugnant to the plain common sense of mankind, are admitted with too much readiness, and are not yet debunked by learning. This is the principal occasion of all that nice and extensive subtilties which renders the study of mathematics so difficult and tedious. Hence, says he, if we can make it appear, that no finite *extension* contains indivisible parts, or is infinitely divisible, it follows, that we shall at once clear the science of geometry from a great number of difficulties and contradictions which have ever been offered a reproach to human reason, and which make the attainment thereof a business of much less time and pains than it hitherto hath been.

Every particular finite *extension*, which may possibly be the object of our thought, is an idea existing only in the mind, and consequently each part thereof must be perceived. If therefore I cannot perceive innumerable parts in any finite *extension* that I consider, it is certain they are not contained in it; but it is evident, that I cannot distinguish innumerable parts in any particular line, surface, or solid, which I either perceive by sense, or figure to myself in my mind; wherefore, I conclude they are not contained in it. Nothing can be plainer to me, than that the *extension* I have in view are no other than my own ideas; and it is no less plain, that I cannot resolve any one of my ideas into an infinite number of other ideas; that is, that they are not infinitely divisible. If by an infinite *extension* be meant something distinct from a finite idea, I declare I do not know what that is, and so cannot affirm or deny any thing of it. But if the terms *extension*, parts, and the like, are taken in any sense conceivable; that is, for ideas; then to say a finite quantity of *extension* consists of parts infinite in number, is to manifest a contradiction, that every one at first sight acknowledges it to be so. *New Theory of Vision*, § 54, 55. *Analyst*, § 21.

On the other hand, it is observable by an eminent mathematician, that geometers are under no necessity of supposing that a finite quantity of *extension* consists of parts infinite in number, or that there are any more parts in a given magnitude than they can conceive or express: it is sufficient that it may be conceived to be divided into a number of parts equal to any given or proposed number; and this is all that is supposed in strict geometry concerning the divisibility of magnitude. It is true, that the number of parts into which a given magnitude may be conceived to be divided, is not to be fixed or limited, because no given number is so great but a greater than it may be conceived and assigned; but there is not therefore any necessity for supposing that number infinite; and if some may have drawn very absurd consequences from such suppositions, they are not to be imputed to geometry. See *Maclaurin's Treatise of Fluxions*, art. 290.

Dr.

Dr. Reid, a late writer, in his Inquiry into the Human Mind, on the principles of common sense, endeavours to obviate the difficulties suggested by Berkeley, by overturning the system of ideas established by Mr. Locke. According to his theory, it is absurd to deduce from sensation the first origin of our notions of external existence, of space, motion, and extension, and all the primary qualities of bodies; they have, he says, no resemblance to any sensation, or to any operation of our minds, and therefore they cannot be ideas either of sensation or of reflection; nor can we conceive how extension or any image of extension can be in an unextended and indivisible subject like the human mind.

EXTENSION of fractured limbs, in Surgery. When the fractured bones maintain their natural situation, the surgeon has nothing to do but to apply a proper bandage to keep them in it; but when the fractured parts recede from one another, some degree of extension is necessary, which must always be suited to the distortion of the limb. The greater distance there is between the extremities of the divided parts of the bone, so much the shorter will the limb become from the natural contraction of the muscles, and the extension must be proportionally the greater; but in these cases every thing is to be done tenderly, and with great care. 1. The patient is to be kept very firm and steady; the posture of the body must be, in this operation, different, according to the different circumstances of the case: sometimes sitting, and sometimes lying, are the most proper. 2. An assistant must support the limb with his hands, both above and below the fractured part. 3. The person who holds the lower part of the limb must extend it strongly and equally, all the fractured bone can be replaced; but when the surgeon is called at some distance of time from the accident, and a tumor and inflammation are come on, it is best in such case to defer the extension of the parts till these symptoms are removed, by letting blood, lightening the bowels, giving the patient large quantities of aqueous fluids, and prescribing the proper internal remedies for soothing inflammation, and fomenting the parts with warm diluent decoctions. These applications will usually succeed so well as to take down the inflammation in twenty-four hours, in such a manner, that the extension of the limb may be safely attempted; but when they do not take place so suddenly, they are to be repeated all they have the desired effect; and where the common fomentations fail, the following has often very great and happy success: take two or three handfuls of licium, and boil them for about a quarter of an hour in a pint of water, with six ounces of rectified spirit of wine; afterwards mix with it an ounce of common salt, and half an ounce of salt-petre, and apply this to the inflamed fractured limb. To make the proper extension of a limb, the surgeon must, while it is kept in its proper length by two assistants, direct it with his hands, sometimes a little one way, sometimes another, putting it into different positions, as the nature of the case shall require, till the parts have recovered their natural situation. This will be known by the remission or absence of pain, and by observing that the fractured limb is of the same length with the sound one; and if these signs of success in the operation are wanting, there is great reason to suppose that the operation is as yet ineffectual, and the extension is to be repeated or continued till the bones are evenly and properly replaced. Hister's Surg. p. 108.

EXTENSOR, in Anatomy, a name common to several muscles, serving to extend or stretch out the parts, and particularly the hands and feet; such are the

EXTENSOR carpi ulnaris, called also *extensor internus*, a muscle, which, coming from the internal protuberance of the humerus, and passing tendinous under the ligamentum anulare, is inserted into the upper part of the bone of the metacarpus, which answers to the little finger; this, and the *ulnaris flexor* moving together, draw the hand sideways towards the ulna. See Tab. Anat. (Mysl.) fig. 1. n. 38. and fig. 6. n. 18.

EXTENSOR carpi radialis, called also *radialis externus*, and *brachii*, is really two distinct muscles. The first arises from above the external protuberance of the humerus, and the second from the lowermost part of the external protuberance. They both lie along the external part of the radius, and, passing under the annular ligament, one is inserted into the bone of the metacarpus that sustains the fore-finger, and the other to that which sustains the middle-finger: these two extend the wrist. See Tab. Anat. (Mysl.) fig. 1. n. 29. and fig. 6. n. 19.

EXTENSOR communis digitorum manus, arises from the external protuberance of the humerus, and at the wrist divides into three flat tendons, which pass under the annular ligament, to be inserted into all the bones of the fore, middle, and ring-finger. See Tab. Anat. (Mysl.) fig. 1. n. 27. fig. 6. n. 20. It very much resembles the perforatus and perforans, and

lies on the outside of the fore-arm, between the ulnaris externus and radialis externus. It is fixed above, by a tendinous extremity to the posterior and lower part of the external or great condyle of the os humeri; and, by a tendinous adhesion on each side, to the ulnaris and radialis externus. It has likewise sometimes a small insertion in the radius: it is divided into four muscles, like the perforatus and perforans, and four long slender small tendons. Three of these tendons pass through the common external annular ligament of the carpus; and the fourth, which goes to the little-finger, and which has sometimes its fleshy portion distinct from the rest, passes through a particular ring of the same ligament. Afterwards, these four tendons separate as they go to the fingers, and in their passage communicate with each other, by oblique tendinous series, chiefly near the heads of the metacarpal bones. The tendons of the middle and little-finger are sometimes double, and yet communicate with the rest.

Each tendon, having reached the basis of the first phalanx, is slightly inserted therein by some lateral expansions, fixed in each side of the basis: from thence it advances to the head of the same phalanx, where it is divided into two flat portions, which, at the articulation of the first phalanx with the second, leave some distance between them. About the head of the second phalanx they unite again, and are fixed in the convex side near the basis in the third phalanx. The separation of the two portions is in some fort rhomboidal, and each portion is strengthened by a common tendon of the lumbales and interossei, and in the small spaces between them are small tendinous frons, more or less transverse. Winslow's Anatomy, p. 190.

EXTENSOR primi intermedii pollicis, arises from the upper and external part of the ulna, and passing obliquely over the tendon of the *radialis externus*, is inserted near the second joint of the thumb.

EXTENSOR secundi intermedii pollicis, arises from the upper and internal part of the radius, and is inserted into the upper part of the second bone of the thumb.

EXTENSOR tertii intermedii pollicis, arises from the ulna, a little below the first extensor, and is inserted into the third bone of the thumb.

EXTENSOR indicis, comes from the middle and external part of the ulna, and passing under the annular ligament is inserted into the third bone of the fore-finger, where it joins the *extensor communis*.

EXTENSOR minimi digiti, arises from the external protuberance of the humerus, and from the upper part of the ulna, and passing under the annular ligament, is inserted into the third bone of the little finger. See Tab. Anat. (Mysl.) fig. 1. n. 37. and fig. 6. n. 17.

EXTENSOR digitorum pedis longus, is a muscle derived from the fore-part of the upper epiphysis of the tibia, and growing tendinous about the middle thereof, it runs in four tendons under the annular ligament, to the third bone of every toe, except the pollex. See Tab. Anat. (Mysl.) fig. 2. n. 45. fig. 1. n. 64.

According to Winslow, it is a long muscle, fleshy in its upper part, but tendinous in the lower, lying between the tibialis anticus and peroneus maximus. It is fixed above by fleshy fibres in the outside of the head of the tibia, and inside of the head of the fibula, in the upper part of the interosseous ligament, through three-fourths of the length of the fibula, and through the same space in the tendinous septum belonging to the anterior angle of that bone. It seems to mix some fibres on each side with the two first peronei and tibialis anticus, and is very closely united with the peroneus maximus. It contracts in breadth a little above the annular ligament, and in passing through it is divided into three tendons, the first of which is afterwards again divided into two. These four tendons are inserted along the upper or convex side of the bases of the four small toes. Winslow's Anatomy, p. 222.

EXTENSOR digitorum pedis brevis, comes from the exterior and fore-part of the calcaneum, and goes to the second joint of the toes. See Tab. Anat. (Mysl.) fig. 1. n. 73. It is fixed in the upper and outer side of the anterior apophysis of the altragula, and in the adjoining part of the upper side of that bone. Thence it runs obliquely inwards, and is divided into four fleshy portions, which terminate in four tendons. The first is inserted in the upper part of the first phalanx of the great toe; and the other three, joining with those of the *extensor longus*, are inserted along the convex sides of all the phalanges of the three following toes. When there is a fifth tendon, which sometimes happens, it goes in the same manner to the little toe. Winslow's Anatomy, p. 223.

EXTENSOR indicis proprius, a small long muscle, with a long slender tendon, lying a little obliquely on the lower and outer-half of the fore-arm, between the ulna and the

fore-finger. It is fixed by its fleshy body a little higher than the lowest third part of the outside of the ulna, below the insertion of the *extensor pollicis*; and it has likewise a small adhesion to the interosseous ligament. From thence it runs down, ending in a distinct tendon, without any communication, which having passed through the annular ligament of the *extensor communis*, afterwards joins that tendon which goes to the index. Winslow's Anatomy, p. 260.

EXTENSOR digitorum proprius, a collateral or auxiliary muscle of the *extensor communis*, of which it appears almost always to be more or less a portion. It is fixed along the faccer external half of the ulna, from whence its long small tendon runs down in company with the fourth tendon of the *extensor communis*, all the way to the little-finger, where it joins, and is inserted with it. Sometimes this muscle is wanting, in which case the *extensor communis* sends a double, and sometimes a treble tendon to the little finger. Winslow's Anatomy, p. 260.

EXTENSOR pollicis manus, two very distinct muscles, the first or longer of which is sometimes more, sometimes less, and sometimes altogether divided into two; in which case these muscles are three in number. They are situated obliquely between the ulna and the convex side of the thumb.

The *extensor primus* is a long muscle, more or less double, and is fixed above by fleshy fibres, first to the outside of the ulna, near its upper extremity, below the scoumus, niter and insertion of the *unaris externus*; next to the interosseous ligament, under the *supinator brevis*; and finally, to the middle part of the outside of the radius.

From thence it runs down, and passes anteriorly over the lower part of the radius, and tendons of the *supinator longus* and *radialis externus*; and being gradually divided, it terminates in two long flat tendons, more or less subdivided, which pass together under a particular annular ligament, being only parted by facts or fenns belonging to that ligament. The first of these two principal tendons is inserted in the edge of the basis of the first phalanx, near the large transverse ligament of the carpus; when this tendon is subdivided, the other portion of it is fixed in that bone of the carpus which sustains the thumb. The other principal tendon, which often belongs to a muscle entirely distinct from the former, is fixed in the convex side of the basis of the second phalanx, where it joins the tendon of the *extensor secundus*. On account of these different insertions of the two tendons, this muscle is by some authors described as two.

The *extensor secundus* is shorter than the first; it is fixed to the ulna below the former, and above the insertion of the *extensor indicis proprius*, and likewise to the neighbouring part of the interosseous ligament. From thence it runs down obliquely on the middle part of the radius, where it has also a small adhesion; after this it passes through the small channel in the styloide apophysis of the radius through the annular ligament belonging to the tendons of the *radialis externus*, and over these tendons, being parted from them by a small ligamentary septum. It is inserted in the convex part of the third phalanx near its base, having, as it passes over the second phalanx, joined the second or collateral tendon of the first *extensor*, more or less. Winslow's Anatomy, p. 199.

EXTENSOR pollicis radii longus, rises large and fleshy from the fore-part of the flexor, a little below its upper process; whence, passing under the annular ligament, it is inserted into the upper part of the second bone of the great toe. See *Tek. Anat. (Myol.)* fig. 2. 71.

It is fixed to the inside of the flexor, near the interosseous ligament, from the neck down to the lower quarter of that bone; to the interosseous ligament through the same space, and a little to the lower extremity of the ulna near the fibula. It there ends in a considerable tendon, which passing through a distinct ring of the common annular ligament, and then through a membranous vagina, is inserted in the basis of the first phalanx of the great toe, and continued up to the second. Winslow's Anatomy, p. 221.

EXTENSOR pollicis radii brevis, springs fleshy from the fore-part of the os calcis, and, after a short belly, is contracted into a slender tendon, which, running obliquely over the upper part of the foot, is inserted into the second bone of the great toe. See *Tek. Anat. (Myol.)* fig. 1. n. 75; 2. n. 51.

EXTENSOR proprius vicissitudo, in *Anatomy*, a name given by Albinus, and some other late authors, to one of the muscles of the hand, called by Cowper and others the *extensor minimi digiti*.

EXTENSOR tarsi, in *Anatomy*, a name given by Douglas and some others, to a muscle more generally known by the name of the *plantaris*. See *PLANTARIS*.

EXTENT, in *Law*, sometimes denotes a writ or commission to the sheriff for the taking of lands and tenements; sometimes the act of the sheriff upon this writ; and sometimes the estimate or valuation of lands or *proventus* estates, which, when taken at the sheriff's value or extent, furnish out extended, or *rack-rents*. *Inst. lib. ii.*

EXTENSION, the act of diminishing or lessening the bulk or fullness of a thing, especially of the human body. *Fervor*, *agress*, long abstinence, &c. occasion great *extension* or emaciations.

EXTENSIVUM is also a figure in *Rhetoric*, opposite to the hyperbole. The Greeks call it *stasis*.

EXTERIOR Palpebre, *Tarsus*. See the substantives.

EXTERMINATION, formed of *ex* and *terminus*, *boundary*, the act of *extirpating*, or totally destroying a people, race, family, &c.

The Jews have been *extirpated* out of Portugal, the Moors out of Spain, the Albigenses out of France, &c. Philip the Fair of France, to be revenged on the Knights Templar, took a resolution in 1307 to *extirpate* them.

EXTERMINATION, or **EXTIRPATION**, in *Algebra*, is used for taking away. Thus algebraists speak of *extirpating* fluids, fractions, and unknown quantities out of equations. See *Maclaurin Algebra*, part i. chap. 12. where we have some general theorems for the *extirpation* unknown quantities in given equations.

EXTERNAL, or **EXTRINSIC**, a term of relation, applied to the surface or outside of a body, or that part which appears or presents itself to the eye, touch, &c.

In which sense it is opposed to *internal*, or *intrinsic*. *External* medicines are also called *herb medicines*, and *topics*. The fluids are divided into *external*, which are those whereby we perceive ideas, and the perception of external objects; as seeing, hearing, &c. and *internal*. See *NERVES*.

EXTERNAL is also used to express a thing that is without a wall, or that is open to the air, and particularly in his mind. *His mind is very external*, &c.

The existence of *external objects*, i. e. of bodies and objects of sense, is said to be a thing which has been greatly and justly doubted by Dr. Berkeley, and others. See *NOTION*, *DOUBT*, and *QUANTITY*.

EXTERNAL ANGLE, are the angles of any right-lined figure formed without it, when all the sides are severally produced. These are all, taken together, equal to four right angles. Particularly, in a triangle, the *external angle* is equal to both the internal and opposite ones. See *TRIANGLE*.

EXTERNAL Denudation, *Ear*, *Mouth*, *Plan*. See the substantives.

EXTERNUS *auris*, in *Anatomy*, a small muscle coming from the side of the meatus auditorius, to the short process of the malleus; serving to draw the handle thereof downwards, and so to relax the membrane tympani. See *EAR*.

EXTERNUS *Brachijis*, *Cubiti*. See the substantives.

EXTERNUS *Ductus*, a name given by Douglas to one of the muscles of the ear, called by Cowper and others *relaxans auris*, and by Albinus *exterior mallei*.

EXTERNUS *Mallei*, in *Anatomy*, a name given by Albinus to one of the muscles of the ear, called by others *obliquus externus*, and *external malleus*.

EXTERNUS *Gingivorum*, *Ductus*. See the substantives.

EXTERNUS *Oculus*, *Phryganeus*, *Papilio*, *Rottor Capiti*. See the substantives.

EXTINCTIO, the act of *extirpating*, that is, of putting out, or destroying a fire, flame, or light.

The *Antiquarians* account for the *extinction* of fire from the practice of *extirpating* it, thus by *fires*, *water-quits* are fire, having the qualities of water; are contrary to the nature of fire, the one being cold and moist, and the other hot and dry. But how far this will go, may appear hence, that fire is extinguished by hot water as readily as cold, may even be oil, earth, &c.

Some of the moderns offer two more plausible causes of *extinction*, viz. *abstraction*, as when the next immediate fuel of the flame is diffused and blown off by the force of a wind, and *passivation*, when it is so compressed, that its fire motion cannot be maintained; as happens upon throwing water, &c. thereon. Various preparations and engines have been contrived for extinguishing accidental fires. See *FIRE*.

EXTINGUISH, *deinde*, that there is properly any such thing as *extinguishing* of fire; it is a body *per se* quiescent, or of an immutable nature, and we can no more *extinguish* or destroy it, than we can create it.

EXTINGUISH, in *Chemistry* and *Pharmacy*, is when a metal, mineral, or the like body, after having been heated red-hot in the fire, is plunged in some fluid, colder to soften or temper its acrimony, as tury in rose-water; or to

communicate its virtue to the liquor, as iron or steel to common water; or, lastly, to give it a temper, as in the *extinction* of steel in water, or some other preparation.

EXTINGUISHMENT, in Law, is used for a *confiscation*. Thus, if a man, having a yearly rent due to him out of his lands, afterwards purchase the same lands, both the property and rent becoming consolidated, or united in one possessor, the rent is said to be *extinguished*. So, where a man has a lease for years, and afterwards buys the property, there is a *confiscation* of the property, and an *extinguishment* of the lease.

So also, if there be land mesne and tenant, and the lord purchase the tenancy, the mesne is *extinct*.

Likewise by purchasing of lands wherein a person hath common appendant, the common is *extinguished*. Cro. E. 504. A release of common in one acre, is an *extinguishment* of the whole common. Shower's Rep. 350.

And where a person hath common of pasture, if he incloses any part of the land, all the common is extinct. 1 Hawk. 174. If a man hath a high-way appendant to land, and afterwards purchase the land wherein the high way is, the way is extinct; though it is held, that a way of necessity to a market or church, or to arable land, is not to *extinguish*.

EXTINGUISHMENT of a copyhold takes place on any act of the copyholder, which denotes his intention to hold no longer of his lord, and amounts to a determination of his will. As if a copyholder in fee accepts a lease for years of the same land from the lord, or accepts an assignment of a lease made to another from the lord, his copyhold is extinct.

EXTINGUISHMENT of debt happens in a variety of cases.

Thus if a creditor accepts a higher security than he had before, or accepts a bond for a legacy, the first debt or legacy are hereby *extinguished*.

EXTINGUISHMENT of *franchise*, in Law. If liberties and franchises granted by the king, come again to the crown, they shall not be *renewed*; but it is otherwise in the king's grant of felon's goods, ransoms, wrecks, &c. q. Rep. 25.

EXTINGUISHMENT of *tenure*. If the land purchasee or accepts any part of the tenancy, out of which an entire service is to be paid, the service becomes thereby extinct; unless it be for the public good or homage and fealty, which are not subject to *extinguishment*.

EXTINGUISHMENT of *way*. See **EXTINGUISHMENT**.

EXTRACTION, formed of *ex*, and *trahere*, *tract*, the act of pulling up, or destroying a thing to the very roots. Among the prayers of the Romish service, there is one for the *extraction* of heresy.

EXTRACTION is also used, in Surgery, for cutting off any part externally; as a wen, &c. or the eating it away, as a wart, &c. by corrosive medicines. See **AMPUTATION**, and **CORROSION**.

EXTRACTION, in Law, a judicial writ, either before or after judgment, that lies against a person, who when a verdict is found against him for land, &c. doth maliciously overthrow any lease, or *extricate* any trees upon it. See Rep. 13. p. 56.

EXTRIPLEX, formed of *extra*, and *triplex*, of *spin*, I spin, *extriplex*, in divination, an officer who viewed and examined the entrails of victims in order to draw prognostics from them as to future.

This kind of divination, called *extriplex*, was much in vogue throughout Greece, where there were two families, the *Phanidae* and *Corymbæ*, consecrated, or set apart, peculiarly for it.

It appears to have been very ancient, and was probably derived from the ancients. Virgil, *Æn.* 4. lib. i. gives the following plausible account of its origin. He says that the ancients inspected the livers of those animals which frequented the places where they intended to build or encamp: and if they commonly found that the liver, to which they attributed sanctification, was injured, they concluded that the waters and no-moriment collected near such places were not wholesome.

In Italy, the first *extriplex* were the *Hæmantes*, among whom, likewise, the art was in great repute. Lucan gives us a fine description of one of these operations in his fifth book.

EXTORTION, in Law, an illegal manner of wresting anything from a man, either by force, menace, or authority.

If an officer, by terrifying another, on pretence of his office, takes more than his ordinary fees, or dues, he commits, and is indictable for *extortion*.

So the exacting of unlawful duties, winning by unlawful game, and, in fine, all taking of more than is justly due by colour or pretence of right, as excessive tolls in markets, excessive prices of ale, bread, victuals, wares, &c. come under *extortion*.

Crompton says, that wrong done by any man, is pro-

pely a trespass, but excessive wrong is *extortion*; which is most properly applicable to sheriffs, mayors, bailiffs, and other officers, who, by colour of their office, greatly oppress and wrong the king's subjects, by taking excessive rewards, or fees, for executing their office.

EXTRA-judicial part. See **SPOKESMAN**.

EXTRA-judicial, touching due out of the proper court, or the ordinary course of law. As when judgment is given in a cause, or case, not depending in that court where such judgment is given, or wherein the judge has no jurisdiction.

EXTRA-mundane space, is the infinite, empty, void space, which is by some supposed to be extended beyond the bounds of the universe, and consequently in which there is really nothing at all.

EXTRA-pericholus, is place out of the bounds of any parish; or privileged and freed from the duties of a parish.

EXTRACT, **EXTRACTUM**, in Pharmacy, the power and spirit part of a vegetable, or other body, separated from the coarser, by distillation and digestion with a proper menstruum; and afterwards reduced into a thick, moist condense by distillation, or evaporation of the humidity of the menstruum.

Mr. Geoffroy, who well knew the value of this form of medicine, attempted to improve upon the common method of making *extracts*, and succeeded greatly to his wishes; the consequence of which was his presenting to the Academy of Sciences at Paris his method of doing it.

The hint was taken from a method used by the count Laguais, to make what he called his essential salts of plants; which were only dry *extracts*, prepared by powdering the substance, and then keeping it in continual motion for six or seven hours in common water, by means of a chocolate mill, turned by a large horizontal wheel. After the water had subsided for an hour, the remaining liquor was poured off, and evaporated over a balneum Mariæ, or in the sun, and a valuable dry *extract* prepared. The method of this process made it impracticable in large quantities of medicines; and Mr. Geoffroy removed the great difficulties that attended it, by proving from repeated experiments, that boiling or infusing the substances in hot water, extracted from them all that was got out by the long motion of the mill; as was instanced in the most familiar manner, in the common way of making tea and coffee, which were found to impregnate water with as much of their virtue by the methods of infusion and decoction, as by ever so long an operation in the count's method. The expense of making *extracts* of this kind cannot but be greater than that of managing the same medicines any other way: but the ease of taking, and the small dose, cannot but sufficiently recommend them; and according to Mr. Geoffroy's method, the sick may prepare them for themselves. A R. Geoffroy gives some examples of his success in these preparations: he took a dram of iris in powder, and pouring on it a quantity of hot water, left it in infusion twenty-four hours; then filtering the infusion, he evaporated the liquor in balneo Mariæ, to the consistence of a thin syrup, and spreading this over the bottoms of two or three broad earthen plates, that it might dry regularly, he evaporated the remaining humidity over the same balneum; and produced twenty-four grains of a dry *extract*, wholly resembling count Laguais's salt, and operating in the same manner, and with the same virtues, as a dram of sens, whether taken in powder or bolus, or dissolved in any fluids, in any of which forms it had nothing of the nauseous taste of sens. See Mem. Acad. Science. Par. 1738.

Essentials are prepared from a variety of different drugs; as the bark, gentian, jalap, opium, &c. See **EXTRACTUM** **Galenicum**.

EXTRACT, in Medicine of Literature, denotes a short abridgement of a book or paper, or of some of the matters thereof. The journals, newsletters, bibliotèques, memoirs, and other monthly reviews, or quarterly accounts of the affairs of learning, consist principally of *extracts* of the most material passages, doctrines, &c. found in the several books published in that time.

EXTRACT ab æstivo. See **RESTITUTION æstiva**.

EXTRACTA curia, in our Old Writers, the office or profits of holding a court, arising from the customary fees, &c.

EXTRACTION, in Pharmacy and Chemistry, an operation, whereby essences, tinctures, &c. are drawn from natural bodies.

Some will have *extraction* to signify any solution made by menstrua; but, in strictness, there is this difference, that in *soluere* the menstruum absorbs the whole substance of the body, but in *extraction* it carries off only a certain part of it; and in this sense, camphor is dissolved in spirit of wine, but jalap is more properly said

EXT

to be *extracted*; for the resin is only taken out by the menstruum, the other particles being left untouched.

EXTRACTION also frequently signifies such an inspissation, or thickening of a solution, as that a certain quantity of the menstruum being drawn off, the remaining mixture is reduced to the consistence of honey; as in the *extracts* of saffron, ginseng, and the like.

Extracts are chiefly made from vegetables, and require different menstrua, according to the different nature of the plants, especially the gummy kind; for such as are mucilaginous, as gum Arabic, and tragacanth, &c. are not easily dissolved but in aqueous liquors; whereas resinous gums, as galsbanum, scammony, &c. must have burning spirits to dissolve them.

There are others again of a middle nature, which may be dissolved in either sort of menstrua, though not so easily in one as the other; thus aloes, and rhubarb, which are something resinous, are better made into *extracts* with spirit of wine, than water; but plants, which abound less with resin, such as hellebore, &c. are more commodiously *extracted* with water.

To perform *extractions*, therefore, a proper menstruum is necessary, and one which is as *next* akin as possible to the body to be *extracted*.

EXTRACTION, in Surgery, denotes an operation whereby some foreign matter lodged in the body, contrary to the order of nature, is drawn out of the same by manual application, or the help of instruments.

Such is the *extraction* of a stone, formed in the bladder, or in the kidneys, &c.

EXTRACTION of a Cataract. See CATARACT.

Extraction belongs to the **EXERESIS**, as a species to its genus.

EXTRACTION, or *disent*, in *Geology*, denotes the flock, or family, which a person is descended from.

In some military orders, chapters, &c. a candidate must make proof of the nobility of his *extraction* before he is admitted.

EXTRACTION of roots, the method of finding the roots of given numbers, or quantities. See **ROOT**.

The square, cube, and other powers of a number, or root, are formed by multiplying the given number into itself a greater or less number of times, as the **POWER** required is higher or lower.

This multiplication compounds the powers: and the *extraction* of the root decomposes them again, or reduces them to their principles or roots. So that the *extraction* of the root is to the multiplication of the power, what the analysis is to the synthesis.

Thus, 4, multiplied by 4, produces 16; which is the square of 4, or the factum of 4, by itself; and 16, multiplied by 4, makes 64, which is the cube of 4, or the factum of 4 by its square. Such is the composition of powers.

Again, the square root of 16 is 4, because 4 is the quotient of 16 divided by 4; and the cube root of 64 is likewise 4, as 4 is the quotient of 64 divided by the square 4. Such is the *extraction* of roots.

Hence to *extract* the root out of a given power, is the same thing as to find a number, *v. gr.* 4, which being multiplied a certain number of times into itself, produces the given power, *v. gr.* 16 or 64.

For the *extractions* of square and cube roots, it is necessary to have the squares and cubes of all the digits in readiness; as exhibited in the following table.

Roots	1	2	3	4	5	6	7	8	9
Square	1	4	9	16	25	36	49	64	81
Cube	1	8	27	64	125	216	343	512	729

To *extract* the square root out of a given number. 1. Divide the given number into classes, of two figures a-piece; and include each class between two dots, commencing with the place of units, and proceeding to the left in integers, and to the right in decimals; the root will consist of so many parts, or figures, as you have classes. By the way observe, it may happen, that for the last class on the left-hand there shall only be one figure left.

2. Then the left-hand class being the square of the first figure of the root sought, look in the table of roots for the square root answering to that number; or, if the square number be not precisely there, to the next lesser number: this root write down for the first figure of the quotient; and subtract its square from the left-hand class. To the remainder bring down the next class toward the right.

3. Write down the double of the quotient figure under the left hand figure of the second class; and seek how

EXT

oft this duple is contained in the figure over it: the quotient gives the second figure of the root.

4. Write the same quotient under the right-hand figure of the same class; and subtract the product of the whole number underwritten, multiplied by the second figure of the root, from the number over it, as in division.

5. The operation being repeated according to the third and fourth steps, 1. *e.* the remainder being still divided by the double of the root as far as *extracted*; and from the remainder subtract the product of the last divisor, having the last found figure of the quotient added to it, multiplied by this figure, you will have the root required.

E. gr. To *extract* the root of 99856, point it after the following manner, 99856: then seek a number, whose square shall equal the first figure 9, viz. 3, and write it in the quotient; then having subtracted from 9, 3 x 3, or 9, there will remain 0; to which let down the figures as far as the next point, viz. 98, for the following operation. Then taking no notice of the last figure 8, say, How many times is the double of 3, or 6, contained in the first figure 9? Answer, 1. Wherefore having written 1 in the quotient, subtract the product, of 1 x 6, or 6, from 98, and there will remain 32, to which connect the last figure 56, and you will have the number 3756, in which the work is now to be carried on. Wherefore also neglecting the last figure of this, viz. 6, say, 0

How many times is the double of 31, or 62, contained in 375; which may be guessed at from the initial figures 6 and 37, by taking notice how many times 6 is contained in 37? Answer, 6, and writing 6 in the quotient, subtract 6 x 62, or 372, and there will remain 0; whence it appears, that the business is done, the root coming out 316.

Otherwise, with the *extraction* of roots, will find thus:

$$\begin{array}{r}
 99856 \quad 316 \\
 \underline{9} \\
 99 \\
 \underline{63} \\
 36 \\
 \underline{62} \\
 3756 \\
 \underline{3756} \\
 0
 \end{array}$$

And so in others.

Again, if you were to *extract* the root out of 22178991: first having pointed it, seek a number, whose square (if it cannot be exactly equalled) shall be the next less square (or nearest) to 22, the figures to the first point, and you will find it to be

4. For 5 x 5, or 25, is greater than 22; and 4 x 4, or 16, is less; wherefore 4 will be the first figure of the root. This, therefore, being writ in the quotient, from 22 take the square 4 x 4, or 16, and to the remainder 6, adjoin the next figures 17, and you will have 617; from whole division, by the double of 4, you are to

obtain the second figure of the root, viz. neglecting the last figure 7, say, how many times 8 is contained in 61? Answer, 7; wherefore write 7 in the quotient, and from 617 take the product of 7 into 8, or 56, and there will remain 6, to which join the next figure 89, and you will have 887; by the division whereof by the double of 47, or 94, you are to obtain the third figure

in order to this say, how many times 94 is contained in 88? Answer, 0; wherefore write 0 in the quotient, and adjoin the two last figures 91, and you will have 8891; by whole division by the double of 470, or 940, you are to obtain the last figure, viz. say, how many times 940 in 8891? Answer, 9; wherefore write 9 in the quotient, and you will have the root 4709.

But since the product 9 x 9409, or 84681, subtracted from 8891, leaves 4110, the number 4709 is not the root of the number 22178991 precisely, but a little less.

If then it be required to have the root approach nearer, carry on the operation in decimals, by adding to the remainder two cyphers in each operation. Thus the remainder

8

mainend

number 4; so, having two cyphers added to it, becomes 41000; the sixteen whereof, by the double of 4709, or 9418, will give the first decimal figure 4. Then having writ four in the quotient, subtract 4×94184 , or 376736, from 410000, and there will remain 33264. And, to having added two more cyphers, the work may be carried on at pleasure, the root at length coming out 4709, 43037, &c.

But when the root is carried on half way or above, the rest of the figures may be obtained by division alone: as in this example, if you have a mind to extract the root to nine figures, after the five former 4709.4 are extracted, the four latter may be had, by dividing the remainder by the double of 4709.4

Thus, if the root of 32076, were to be extracted to five places, in numbers; after the figures are pointed, write 1 in the quotient, as being the figure whole figure 181, or 1, is the greatest that is contained in 3, the figure to the first point; and having taken the square of 1 from 3, there will remain 2; then having let the two next figures, viz. 20, to it (viz. to 2), seek how many times the double of 1, viz. 2, is contained in 22, and you will find indeed that it is contained more than ten times; but you are never to take your divisor 10 times, nor even 9 times in this case;

because the product of 9×20 , or 180, is greater than 229, from which it would be to be taken, or subtracted; wherefore write only 8. And then having written 8 in the quotient, and subtracted 8×28 , or 224, there will remain 51 and nothing set down to this figure 76, seek how many times the double of 18, or 36, is contained in 51, and you will find 1, and so write 1 in the quotient; and having subtracted 1×361 , or 361, from 576, there will remain 215. Lastly, to obtain the remaining figures, divide this number 215, by the double of 181, viz. 362, and you will have the figures 59, which, being writ in the quotient, give the root 181.59. After the same manner are roots extracted out of decimal numbers. Thus, the root of 32076 is 181.594, and the root of 32076 is 181.594; and the root of 0.32076 is 0.18159, and so on. But the root of 3207.6 is 57.4747, and the root of 32.076 is 5.74747. And thus the root of 0.9936 is 0.996.

To extract the cube, or higher root, out of a given number. The extraction of the cubic root, and all other roots, may be comprehended under one general rule; viz. every third figure, beginning from unity, is first to be pointed, if the root to be extracted be a cubic one; or every fifth, if it be a quinquate-cube (or of the fifth power); and then such a figure is to be writ in the quotient, whose greatest power (that is, whole cube, if it be a cubic power, or whole quinquate-cube, if it be the fifth power, &c.) shall either be equal to the figure, or figures, before the first point, or next less under them; and then having subtracted that power, the next figure will be found by dividing the remainder augmented by the next figure of the resolvend, by the next lesser power of the quotient multiplied by the index of the power to be extracted, that is, by the triple figure, if the root be a cubic one; or by the quintuple biquadrate (that is, five times the biquadrate), if the root be of the fifth power, &c. And having again subtracted the power of the whole quotient from the first resolvend, the third figure will be found by dividing that remainder, augmented by the next figure of the resolvend, by the next lesser power of the whole quotient, multiplied by the index of the power to be extracted.

Thus, to extract the cube root of 13312053, the number is first to be pointed after this manner, viz. 13312053; then you are to write the figure 2, whole cube is 8, in the first place of the quotient, as that which is the next lesser cube to the figure 13 (which is not a perfect cube number), or as far as the first point; and having subtracted that cube, there will remain 51, which being augmented by the next figure of the resolvend, viz. 3, and divided by the triple square of the quotient 2, by seeking how many times 3×4 , or 12, is contained in 51, gives 4, or the second figure of the quotient. But since the cube of the quotient 24, viz. 13824, would come out too great to be sub-

Vol. II. N^o 43.

tracted from the figures 13312, that precede the second point, there must only 3 be writ in the quotient; then the quotient 23 being in a separate place multiplied by 23, gives the square 529, which again multiplied by 23, gives the cube 12167; and this taken from 13312, will leave 1145; which augmented by the next figure of the resolvend 0, and divided by the triple figure of the quotient 23, viz. by seeking how many times 3×529 , or 1587, is contained in 11450, gives 7, for the third figure of the quotient. Then the quotient 237, multiplied by 237, gives the square 56169, which again multiplied by 237, gives the cube 13312053; and this, taken from the resolvend, leaves 0. Whence it is evident, that the root sought is 237.

So also, to extract the quatuor-cubical root of 36420820, it must be pointed over every fifth figure; and the figure 3, whole quatuor-cube, or fifth power 243 is the next lesser to 364, viz. to the first point, must be writ in the quotient. Then the quatuor-cube 243 being subtracted from 364, there remains 121, which augmented by the next figure of the resolvend, viz. 2, and divided by five times the biquadrate of the quotient, viz. by seeking how many times 5×81 , or 405 is contained in 1213, gives 2 for the second figure. That quotient 32, being thrice multiplied by itself, makes the biquadrate 1048576; and this again, multiplied by 32, makes the quatuor-cube 33554432, which, being subtracted from the resolvend, leaves 2878388. Therefore 32 is the integral part of the root, but not the true root; wherefore, if you have a mind to prosecute the work in decimals, the remainder, augmented by a cypher, must be divided by five times the aforesaid biquadrate of the quotient, by seeking how many times 5×1048576 , or 5242880, is contained in 28783880, and there will come out the third figure, or the first decimal 5. And so by subtracting the quatuor-cube of the quotient 325 from the resolvend, and dividing the remainder by five times its biquadrate, the fourth figure may be obtained. And so on in infinitum.

In some cases, it is convenient only to indicate the extraction of a root, especially where it cannot be had exactly. Now, the sign, or character, whereby roots are denoted, is $\sqrt{\quad}$; to which is added, the exponent of the power, if it be above a square, and even sometimes if it be not. E. g. $\sqrt[3]{\quad}$ denotes the cubic root; $\sqrt[4]{\quad}$ the quatuor-cube root, &c. See Root.

When a biquadrate root is to be extracted you may extract twice the square root, because $\sqrt[4]{\quad}$ is as much as $\sqrt{\sqrt{\quad}}$. And when the cubo-cubic root is to be extracted, you may first extract the cubic root, and then the square root of that cube root, because the $\sqrt[6]{\quad}$ is the same as $\sqrt[3]{\sqrt{\quad}}$; whence some have called these roots not cubo-cubic ones, but quatuor-cubes. And the same is to be observed in other roots, whose indices are not prime numbers.

To prove the extraction of roots. 1. For a square root, multiply the root found by itself, and to the product add the remainder, if there were any; if the sum be equal to the number given, the operation is just.

2. For a cube root. Multiply the root found by itself; and the product, again, by the same root. To the last product, add the remainder, if there were any. If the sum come out the number first given, the work is just. After like manner may the extraction of the other roots be proved.

To extract the ratio of equalling, or of equating quantities. The extraction of roots out of simple algebraic quantities, is evident, even from the nature, or mark of notation itself; as that $\sqrt{a \times a}$ is a , and that $\sqrt[3]{a \times a \times a}$ is a , and that $\sqrt[4]{a \times a \times a \times a}$ is a ; and that $\sqrt[5]{a \times a \times a \times a \times a}$ is a . And also that $\sqrt{\frac{a}{c}}$ is $\frac{a}{c}$, and that $\sqrt[3]{\frac{a}{c}}$ is $\frac{a}{c}$, and that $\sqrt[4]{\frac{a}{c}}$ is $\frac{a}{c}$, and that $\sqrt[5]{\frac{a}{c}}$ is $\frac{a}{c}$. And that $\sqrt{\frac{a \times b}{c}}$ is $\frac{\sqrt{a \times b}}{c}$, and that $\sqrt[3]{\frac{a \times b \times c}{d}}$ is $\frac{\sqrt[3]{a \times b \times c}}{d}$, and that $\sqrt[4]{\frac{a \times b \times c \times d}{e}}$ is $\frac{\sqrt[4]{a \times b \times c \times d}}{e}$, and that $\sqrt[5]{\frac{a \times b \times c \times d \times e}{f}}$ is $\frac{\sqrt[5]{a \times b \times c \times d \times e}}{f}$; moreover, that $\sqrt[3]{a \times a \times c}$, or $\sqrt[3]{a^2 \times c}$, is equivalent to $\sqrt[3]{a} \times \sqrt[3]{c}$, or $\sqrt[3]{a} \times \sqrt[3]{c}$; and that $\sqrt[3]{a \times b \times c}$ is equivalent to $\sqrt[3]{a} \times \sqrt[3]{b} \times \sqrt[3]{c}$, or $\sqrt[3]{a} \times \sqrt[3]{b} \times \sqrt[3]{c}$. And that $\sqrt[4]{a \times b \times c \times d}$ is equivalent to $\sqrt[4]{a} \times \sqrt[4]{b} \times \sqrt[4]{c} \times \sqrt[4]{d}$, or $\sqrt[4]{a} \times \sqrt[4]{b} \times \sqrt[4]{c} \times \sqrt[4]{d}$. I say all these are evident, because it will appear at first sight, that the proposed quantities

are produced, by multiplying the roots into themselves (as a from a into a , a from a into a , a from a into a , &c.) The rule is to extract the required root of the numerical coefficient, if there be any, and to divide the exponents of the literal or algebraic quantities by the number that denominates the root required. It is evident from the application of this rule, that any power which has a positive sign may have either a positive or negative root, if the root is denominated by an even number, because $+$ or $-$, multiplied into themselves an even number of times will give $+$. Also, that if a power have a negative sign, no root of it denominated by an even number can be assigned. But if the root is to be extracted it denominated by an odd number, the sign of the root will be the same as the sign of the given quantity whose root is required. However, it will often happen, that the number denominating the required root will not exactly divide the exponent of the given power, in which case the required root will have a fractional exponent thus, $\sqrt[3]{a^2} = a^{\frac{2}{3}}$. But when quantities could be of several terms, the business is performed as in numbers.

To *extract the square root* out of $a^2 + 2ab + b^2$ in the first place, write the root of the first term a , viz. a , in the quotient, and having subtracted its square a^2 , x

$$\begin{array}{r} a^2 + 2ab + b^2 \\ a^2 \\ \hline c. 2ab + b^2 \\ + 2ab + b^2 \\ \hline 0 \end{array}$$

tracted the product of b into $2a + b$, or $2ab + b^2$, there will remain nothing; which shows that the work is finished, the root coming out $a + b$.

And thus to *extract the square root* out of $a^2 + 6ab + 9b^2$, viz. $a^2 + 6ab + 9b^2$, first let in the quotient the root of the first term a , viz. a ; and having subtracted its square a^2 , x will remain $6ab + 9b^2$. Now, $6ab + 9b^2$ to find the remainder of the root. Say, therefore, how many times is $2a$ contained in $6ab$? Answer, $3b$; wherefore write $3b$ in the quotient, and having subtracted the product of $3b$, im $2a + 3b$, or $6ab + 9b^2$, there will yet remain $-4ab + 12b^2 + 4b^2$ to carry on the work. Therefore, try again, how many times is the double of the quotient, viz. $2a + 6b$, contained in $-4ab + 12b^2$? cc , which is the same thing, say, how many times is the double of the first term of the quotient, or $2a$, contained in the first term of the remainder $-4ab$? Answer, $-2b$. Therefore having writ $-2b$ in the quotient, and subtracted the product $-2b$ into $2a + 6b + 3b$, or $-4ab + 12b^2 + 4b^2$, there will remain nothing.

Whence it follows, that the root is $a + 3b - 2b$, or $a + b$. $a^2 + 6ab + 9b^2 = (a + 3b - 2b)^2 = (a + b)^2$

$$\begin{array}{r} a^2 + 6ab + 9b^2 \\ a^2 + 6ab + 9b^2 \\ \hline 0 \end{array}$$

And thus the square root of the quantity $x^2 - 2x + 1$ is $x - 1$; and the square root of the quantity $y^2 + 4y + 4$ is $y + 2$; and the square root of the quantity $16x^2 - 24ax + 9a^2 + 12bx - 16ab + 4b^2$ is $4x - 3a + 2b$, as may appear underneath.

$$\begin{array}{r} 1. \quad x^2 - 2x + 1 \\ x^2 \\ \hline 0 - 2x + 1 \\ 0 - 2x + 1 \\ \hline 0 \end{array}$$

$$\begin{array}{r} 2. \quad 9x^2 - 24ax + 16a^2 + 12bx - 16ab + 4b^2 \\ 9x^2 \\ \hline 0 - 24ax + 16a^2 + 12bx - 16ab + 4b^2 \\ 0 - 24ax + 16a^2 + 12bx - 16ab + 4b^2 \\ \hline 0 \end{array}$$

$$\begin{array}{r} 3. \quad y^2 + 4y + 4 \\ y^2 \\ \hline 0 + 4y + 4 \\ 0 + 4y + 4 \\ \hline 0 \end{array}$$

$$\begin{array}{r} 4y^2 + 8y + 4 \\ 4y^2 + 8y + 4 \\ \hline 0 \end{array}$$

If you would extract the cube root out of $a^3 + 3a^2b + 3ab^2 + b^3$, the operation is performed thus:

$$\begin{array}{r} a^3 + 3a^2b + 3ab^2 + b^3 \\ a^3 \\ \hline 3a^2b + 3ab^2 + b^3 \\ 3a^2b + 3ab^2 + b^3 \\ \hline 0 \end{array}$$

Extract first the cube root of the first term a , viz. a , and let it down in the quotient; then subtracting its cube a^3 , say, how many times is its triple square, or $3a^2$, contained in the next term of the trinomial $3a^2b$; and there comes out b ; wherefore write b in the quotient, and subtracting the cube of the quotient $a + b$, there will remain 0 ; therefore $a + b$ is the root. After the same manner, if the cube root is to be extracted out of $x^3 + 6x^2 - 40x + 64$, it will come out $2x + 4$. And so likewise in higher roots.

The general rule for *extracting* any root out of any given quantity, is as follows. Having ranged the quantity according to the dimensions of its terms, *extract the first root out of the first term*, and that shall be the first member of the root required; then raise this root to a dimension lower by one than the number that denominates the root required, and multiplying the power that arises by that number itself, double the second term of the given quantity by the power, and the quotient shall give the second member of the root required. The other members of the root, if there be more than two, are found after the same manner, for the reason the exact root cannot be found, it is evident that the square root of $a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4$ is $a^2 + 2ab + b^2$.

$$\begin{array}{r} \frac{5a^4}{12a^3} \text{, \&c.} \\ \frac{a^4}{12a^3} \text{, \&c.} \end{array}$$

EXTREMUM, or **EXTREME**, is applied to the last and remotest part in any thing, or that which includes and terminates it on that side.

The *extremities* of a line are points. There is no passing from one *extremum* into the other, without going through the middle. *Extremes* remedies must only be had recourse to in *extremum* necessity.

Some *extremities* apply the denomination *extremum*, or *extremities*, to the arms and legs.

The arms, or upper *extremities*, consist of sixty-two bones; thirty-one in each, viz. the scapula, humerus, cubitus, radius, eight in the carpus, four in the metacarpus, and fifteen in the fingers.

The lower *extremities*, or legs, consist of sixty-three in each, viz. the femur, tibia, fibula, tibia, seven in the tarsus, five in the metatarsus, and fourteen in the toes. Colson, in his comment on the promission, *extremum*, that there shall be in *extremum* of all great *extremum* for promission, since death is not *extremum* without some alteration in those parts, from their natural state; for in dying persons the *extremum* parts are peculiarly refrigerated, and turn black and black, and sometimes the hands and feet are tinged in red and irregular motions.

EXTREMUM, in *Logic*, denote the two *extremum* terms of the conclusion of a syllogism; viz. the predicate and subject. They are called *extremum*, from their relation to another term, which is a medium or mean between them.

The predicate, as being likewise last in the first proposition, is called the *major extremum*, *greater extremum*; and the subject, as being put in the second, or minor, proposition, is called the *minor extremum*, *lesser extremum*.

Thus, in the syllogism, man is an animal; Peter is a man, therefore Peter is an animal; the word animal is the *greater extremum*, Peter the *less extremum*, and the man the medium. See **SYLLOGISM**.

EXTREMUM and *mean proportion*, in *Geometry*, is when a line is divided, that the whole line is to the greater segment, as that segment is to the other.

Or, as Euclid expresses it, when the line is divided, that the rectangle under the whole line, and the lesser segment, is equal to the square of the greater segment.

The invention of this division is due to the given line be $AB = 2$ (Tab. II. *Geometry*, fig. 43.) and for the greater segment put x , the lesser will be $2 - x$. Then, by the hypothesis, $2 : x :: x : 2 - x$. Therefore $2 - x = \frac{x^2}{2}$, consequently $x = \frac{2}{2} \pm \frac{x^2}{2}$. And, by adding $\frac{x^2}{2}$ on each side, to make $x + \frac{x^2}{2} = 2 + \frac{x^2}{2}$ a complete square, the equation will stand thus, $2 + \frac{x^2}{2} = x + \frac{x^2}{2} + 2$. Now, since the latter is exactly a square, its root $x + 2 = \sqrt{2 + \frac{x^2}{2}}$, and by transposition it will be $\sqrt{2 + \frac{x^2}{2}} - 2 = x$; which last equation is a canon for finding x .

For at the foot of $AB = 2$, fix at right angles $CB = 1$; then draw CA , the square of which is equal $AB^2 + CB^2 = 2 + 1 = 3$. And therefore $AC = \sqrt{3}$; then $CD = CA$. From whence $CB = 1$ being taken, as the case requires, there remains $BD = x$; which transferred into AB , shall give the point E , where AB is cut according to *extremum* and *mean proportion*.

This cannot be exactly done in numbers; but if you would have it tolerably near, add together the square of any number, and the square of its half, and extract, as near as you can, the square root of the sum; from whence taking half, the remainder is the greater part.

EXTREMUM, in *trigonometry*, is when one of the five circular parts of a right-angled spherical triangle, viz. the three sides and two oblique angles, (for the right angle is neglected) is pitched upon for the middle term, then the two circular parts lying immediately next to it are called *extremum adjacent*; and the two parts remote from the assumed middle part, or not immediately next to it, *extremum opposite*. See **CIRCULAR PARTS**, **TRIANGLE**, and **TRIGONOMETRY**.

EXTREMUM UNCTION, one of the sacraments of the Roman church, the fifth in order, administered to people dangerously sick, by anointing them with holy oil, and pronouncing several prayers over them. See **UNCTION**. It is called *extremum unction*, as being only given to persons in *extremum*. In the thirteenth century, it was called the *unction of the sick*, and not *extremum unction*; for, in the earlier ages, it was given before the *extremum*; which practice, according to F. Mabillon, was not changed till the thirteenth century.

The reasons he assigns for the change are, that in that age there arose divers mistaken opinions, several of which we find mentioned and condemned in the English council; among the rest, it was held, that such as had received this sacrament, in case they recovered, might not make use of their wives, nor eat meat, nor go barefooted; whence they chose to forbear it till the last extremity, which practice prevailed. See the comments of Worcell and Exeter, in the year 1287; that of Win-

chell, in 1368; and F. Mabillon, *AdA Sancti*, Bened. dict. Sac. iii, p. 1.

The form of *extremum unction* is now deprecatory, as the divines call it, formerly it was absolute, and indicative. This sacrament is not only in use in the Latin, but also in the Greek church, and throughout the East, though under another name, and with some difference in the circumstances; in that the orientals do not wait till their sick are come to extremity, in order to anoint them; but the sick generally go to church themselves; and it is administered to them as often as they are indisposed; the Greeks taking that direction of St. James, chap. v. ver. 14, which is the foundation of the practice, in a general sense: *Let us find among you that be called for the elders of the church, and let them pray over him, anointing him with oil*. V. Baudouin distinguishes two kinds of *extremum* among the Maronites; the one called *unction with the oil of the sick*, but this he says is, is not the sacrament of *extremum* ordinarily administered to such as are in *extremum* sickness, because the oil is only consecrated by a priest, and it is given to all who are present, not to the sick only, but also to the healthy; even the priest who officiates partakes of it. The other kind of *extremum*, according to that father, is only for the sick; this is performed with oil consecrated by the bishop at noon, on Holy Thursday; and this, it seems, is their sacramental *unction*.

The *unction* with lamp-oil is a rite, not only among the Maronites, but through all the eastern church, who use it very religiously. The truth is, they do not seem to have any other sacrament of *extremum* but this oil. Yet F. Gear observes, though it be only a ceremony, with respect to those in health, it is a real sacrament to those that are sick.

In their great churches there is a *tabernacle*, wherein this oil for the sick is preserved, and they call *tabernacle* *extremum*; that is, the *tabernacle* of *extremum*; for what the Latins call *extremum*, the Greeks call *tabernacle*, or *extremum*, or *extremum*, or *extremum*, or *extremum*.

EXTREMITIES, in *Medicine, is used for the head, hands, and feet. These should be drawn with more nicety and exactness, or more terminated than other parts; and this helps to render the action more capaxious.*

EXTREMUM CAUSAE. See **CAUSE**.

EXTRINSIC is applied, in the *Schools*, in various senses. Sometimes it signifies a thing's not belonging to the essence of another; in which sense, the efficient cause, and the end, or scope, of a thing, are said to be *extrinsic*, or *extrinsic causes*.

Sometimes it implies a thing not being contained within the capacity of another. In which last, those causes are said to be *extrinsic*, which introduce something into a subject from without; as when fire introduces heat, &c. Sometimes it denotes a thing added, or applied to another. Thus, accidents and adherents are said to be *extrinsic* to the subject, and thus *extrinsic* is *extrinsic* to the object seen.

EXTRINSIC ARGUMENT, See **ARGUMENT**. See the following.

EXTRUANCES, in *Medicine*, are castings forth, or issues up in the skin, or other parts of the body.

EXUBILLANCE, compounded of *ex* and *uber*, signifies *exuberance*, in *Rhetoric*, a redundancy. See **REUNDANCE**, and **PLETHORA**.

EXUDATION, the act of sweating out. In which manner, gums, ballans, &c. are usually produced from trees.

EXUCONTIANI, a branch of Arian heretics. See **EXUCONTI**.

EXVERRA, in *Antiquity*, a kind of broth used in cleaning houses, out of which a dead person had been carried.

EXULCERATION, in *Medicine*, the act of casting, or producing ulcers.

Thus, *extremum* exulcerates the intestines; excessive humours exulcerate the skin.

EXULCERATION is sometimes also said for an ulcer itself; but, more generally, for those beginning eruptions which wear away the substance, and form ulcers.

EXULCERATION in the intestines are marks of *peritonitis*.

EXUPORA, in *Botany, a name by which some authors have called the vesicles, or common verrucae.*

EXUSTION, of *ex* and *ustio*, I burn, the act of burning with fire, used in same operations by surgeons. See **ROAST**.

EXUVILE, formed from *exuvio*, to put off, or drop, in *Physiology*, transient parts of certain animals, which they put off, or lay down, and assume new ones.

Such, especially, are the skins, or haunts, of serpents; shells of lobsters, and the like; which are annually changed, and renewed in the spring.

The outer integument of the body, which in man and other larger animals is so durably fixed on the body, is

in many of the animals of the reptile kind much more loosely fixed, and is changeable several times during the period of their lives. The serpent-kind all shift their skins several times in their lives, and the water-newt has been lately observed to do the same; but no creature in the world does it so often as the caterpillar, almost every species of these insects throwing off their old skin once in ten or twelve days, or less; and this in such a manner as is extremely worthy an attentive observation. Malpighi observed that the common silkworm changed its skin four times during its continuance in that state; the first of these changes happening at eleven or twelve days from its appearance from the egg, and the others at the distance of five or six days each; and probably the rest of the caterpillar kind observe nearly the same periods.

Neither is this change of the skin confined to the few creatures we have mentioned; but among the whole insect class, the most numerous of that of all animated beings we know, there is scarce one species every individual of which does not throw off its skin, once at least, before it arrives at its full growth. The term changing the skin is scarce expressive enough for this operation in the caterpillar-kind; for the creature throws off the external covering of every the minutest part and organ of its body, and the skins they thus deposit have so much the appearance of a complete insect, that they are very often mistaken for such, presenting us with every thing that we see in the external appearance of the living animal. If the caterpillar has been one of the hairy kinds, the skin which it throws off is hairy, containing the integument as it were of every hair and each of the legs; and even the claws and other parts, which are not visible without the assistance of a microscope, are as plain in this as in the living animal. But what is most of all amazing, is to find that the very foliolar part which form the head, are also found in the *exuvie*, the skull and teeth being plainly distinguishable in them: it is easy to conceive that this must be a strange operation, for an animal in this manner to withdraw the several parts of its body out of their sheaths and cases, which they have plainly been fitted into in so nice a manner; and particularly the throwing off an old skull and teeth to make way for new ones, seems an act beyond all comprehension. The operation, however, appears as tedious and painful to the animal as we can exactly; if we examine it thrice a day or two before this change happens, the creature always refuses to eat, and loses its former activity; either never walking at all, or at the utmost but very slowly; though they do not move out of their places, however, they are very full of some particular motions in their body; they turn themselves about from side to side, and often elevate their back, and then gently depress it again; they frequently raise up their heads, and strike them down rudely against the things they stand upon, and frequently the anterior half of the body is raised from the place, and thrust very briskly backwards and forwards from side to side, for three or four times together. These are the more obvious motions; but beside these there are other less sensible ones within every ring; these are separately inflated and contracted again alternately, and by this means the skin is greatly loosened from them; and by these motions, and the remaining without food, it is that the body by degrees disengages itself from the skin. Reaumur, Hist. Nat. vol. I. part I. p. 225.

M. Reaumur observed three or four hairy caterpillars, at the time when they were just preparing for their change; and when they threw the very first signs of its approaching, by ceasing to eat and move, he cut, with a fine pair of scissors, many of the hairs off, as close to the body as he could. When the change was perfected, and this skin thrown off, he examined the hairs of the parts, corresponding to those he had cut them short upon in the old skin, while yet upon the animal. If there had been the cases of the new hairs, those must certainly have been cut short with them; but, on the contrary, they were found, in the caterpillar, as long in the country, as in any others. It appears from hence, that though all the other parts thrown off are but the sheaths and cases to what they covered, yet the hairs are real and solid things themselves; and hence it appears, that the creature, when hatched from the egg, must have all its skins perfectly formed, one lying under another, and each furnished with its covering of hairs, so that the old ones are to fall off with the old skins, and the new ones to appear with the new; and probably this may be one great means of forcing off and dislodging the old skin from every part, by the creature's creasing them in part. Ibid. p. 241.

EXUVIA is also used for some shells, and other marine bodies, frequently found in the bowels of the earth; supposed to have been deposited there at the deluge, as before. Vol. II. No 123.

ing the real spoils of once living creatures. See SKELETON, FOSSIL, and DELUGE.

EY, in our Old Writers, the same with *insula*, an island; from which comes *eye*, a small island or islet, vulgarly called *eye*.

EYE, the organ, or part of the body, whereby vision is effected; i. e. whereby visible objects are represented to the mind. The eye, or organ of sight, is generally divided into internal and external parts; or into the eye properly so called, and the appendages thereof.

Under the latter class come the orbit, or cavity, wherein the eye is placed; the *superiorium*, or eye-brow, whereby the rays of light are moderated in their passage to the eye, and sweat, and other nuances, are prevented from falling down into it, though both these purposes are better answered by the anterior and inferior part of the *isthmus*; the *palpebrae*, or eye-lids, which cover and defend it in time of sleep; with their *clia*, or fringes of hair, to break the too fierce impression of the light, and keep off flies and moats, and by their frequent motions to assist in diffusing the tears, and oily secretions of the sebaceous or ciliary glands of the *eyelids*, equally over the surface of the globe of the eye; and the *conjunctiva*, or angles. The eye, properly *situated*, is of a globular form, and consists of tunics, humours, and vessels.

In some parts it is lined with fat, and it is moved with muscles; which two latter are by some anatomists, though somewhat inaccurately, reckoned among the constituent parts of the eye. The *tunicae*, *conjunctiva*, or *membranae*, of the eye, are seven; viz. 1. The *adnata*, or *conjunctiva*, covering the whole ball of the eye, except the fore-part, called the *light*. 2. The *tunica albuginea*, which is placed immediately under the former, and is formed by the expanded tendons of the four straight muscles of the globe of the eye. These two, which some consider only as one coat, are called partial coats, because they invest only a part of the globe of the eye. 3. Immediately under the *adnata* and *albuginea*, is the *sclerotica*, which covers the whole globe of the eye; being opaque everywhere but in the fore-part, which covers the light, and is transparent like horn; which has occasioned anatomists to account this a distinct membrane, the fourth in number, and to denominate it the *cornea*. The fifth is the *choroides*, situate immediately under the *sclerotica*; the internal surface of the *choroides*, called the *tunica Ruffiniana*, from professor Ruffin, or the vascular coat from its texture, immediately invests the external or posterior surface of the *retina*; its fore-part, like the former, is transparent, and therefore accounted a distinct, or sixth coat, and called the *uvea*. Of the duplicature of this part of the tunic, is formed a striped, variegated circle, called the *iris*, which, in different subjects, is of different colours, and gives the denomination of this or that colour to the eye. Near its middle is an aperture, or perforation, called the *pupil*, or *apple of the eye*, about which the iris forms a ring; from the inside of this tunic spring certain fibres, which spreading round the crystalline humour, form the *ligamentum ciliare*. The seventh tunic, which some only make the third, is the *retina*, so called, as resembling a net, and covering only the fund, or bottom, of the eye, opposite to the light.

Of the three proper tunics, the *sclerotica*, *choroides*, and *retina*, the first is derived from the *dura mater*, being detached from the brain as an outer coat, or cover, of the optic nerve, till, arriving at the ball of the eye, it is there expanded into a tunic: the second is derived from the *pia mater*, and transmitted likewise from the brain, along with the optic nerve; the third may be said to be derived from the brain, or *medulla* itself, as being an expansion of the medullary substance of the optic nerve. See each tunic described under its proper article. See also ILL and PART.

The humours of the eye, inclosed between these tunics, are three, viz. 1. The *aqueous*, a limpid, transparent humour, situate in the fore-part of the eye, immediately under the *cornea*, and occasioning its protuberance. 2. The *crystalline*, situate immediately under the *aqueous*, behind the *uvea*, opposite to the pupil. 3. The *vitreous*, or glassy humour, which fills all the hind part of the cavity of the globe; and is that which gives the spherical figure of the eye: on its back part is the *retina* spread. See each humour under its proper article, AQUEOUS, CRYSTALLINE, and VITREOUS.

Some authors, finding these humours covered with proper membranes, have given distinct names to them; as the *aqueous*, *crystalline*, and *vitreous tunics*; but these being only productions of the other coats above mentioned, the distinction is not much regarded. See the situation of the several coats and humours above described, represented by a figure of the eye, in Tab. II. Opticæ, fig. 20. aa is the *sclerotica*; AA the *cornea*, or the *choroides*; pp the *pupils*; pp, pp, the *iris*; CC the *crystalline* humour, suspended

supported by 4, 4, the *ligamenta ciliaria*, or *processus ciliares*; NN the optic nerve, the expansion of which, as far as the *ligamenta ciliaria*, forms the *retina*. The *aqueous humour* is contained in the cavity lying between the *crystalline* and the *cornea*; and the larger cavity, beyond the *crystalline*, is occupied by the *vitæ vitæ*.

The vessels of the eye are, nerves, glands, arteries, and veins. 1. The nerves are the optic pair, which, issuing through a perforation in the skull, behind the orbit, enter the ball of the eye, and diffuse and lose themselves therein: the outer coat, as already observed, going to form the *fibrous*, the inner to the *choroides*, and the *membrana* to the *retina*.

Besides which, the *retina*, *palpebrae*, the first branch of the fifth pair, called *ophthalmica*, and the sixth pair, are bestowed on the muscles of the eye.

2. On the upper part of the ball of the eye, near the lesser or outer canthus, is the *glanula lacrymalis*, or *lacrimalis*, which separates the matter of the tears, to be discharged by the continual motion of the eye-lid upon the *cornea*, to moisten it, and facilitate its motion: the tears, falling down the *cornea*, are stopped by the edge of the under eye-lid, along which they run, till they fall into two small holes in the great angle, one in each eye-lid, called *puncta lacrymalia*, which lead to a small bag, called *sacculus lacrymalis*, from the bottom of which a small tube arising, called *ductus of nose*, opens into the nose. Between the two *puncta* is a caruncle, or eminence, which serves to separate and keep them open, and which was anciently taken for the *glanula lacrymalis*. Near this *caruncula lacrymalis* is situated a small semilunar membrane, called *membrana semilunaris*, which mutually assists, and is assisted by the caruncle, in directing the tears to the *puncta lacrymalia*.

The *glanula ciliaria*, or *glanula sebacea Meibomii*, and their orifices, called *puncta ciliaria*, are situated in regular rows, parallel to the borders, or internal edges of the *palpebrae*, formed by the *tarfi*, or their cartilages, composing the greater part of the edge of each eye-lid. The use of the ciliary glands is to separate an oily, soft fluid; and the use of the *farinae*, or *puncta*, is to convey this fluid, when secreted, to the surface of the internal parts of the eye-lids, and to the external surfaces of the globes of the eye.

3. The eye receives arteries, both from the internal and external carotids, and returns the blood by veins that go to the jugulars.

The muscles of the eye are six: four of which are, from their situation, called *recti*, or straight muscles; and two, *obliqui*. The *recti* come from several points of the bottom of the orbit, and run immediately between the *fibrous* and *adventitious*: they derive several denominations from their several offices: viz. *attollens*, or *superius*, which draws the eye upwards; *deprimens*, or *inferius*, which calls it down; *adducens*, and *abducens*, which draws the eye towards the nose; and *abducens*, or *inward*, which draws it the other way towards the lesser angle.

The two oblique muscles are, the *superior*, called also *rotator*, and *trochlearis*, and the *inferior*. These muscles, together with the optic nerve, are surrounded by a considerable quantity of fat, which makes an easy bed for them, and for the whole globe of the eye, and thus greatly assists the muscles of the eye and the eye itself, in the variety of motions of which they are capable. See each muscle in its proper place.

The whole structure and apparatus of the eye tend to this, that there be produced a distinct and vivid collection in the bottom of the eye, directly under the pupil, of the rays which, proceeding from any point of an object and entering the eye, penetrate the crystalline humour; and that in many points be painted in the bottom of the eye as are conspicuous in an object, that so a small image similar to it may be represented on the *retina*.

In order to this, the rays from any radiant or reflecting point striking on the *cornea* are refracted towards the perpendicular, and thus determined to proceed through the aperture of the pupil to the surface of the crystalline; while other rays, which entered to obliquely as to be thrown upon the iris are reflected out again, that they may not disturb the distinctness of the light; and others, whose less obliquity threw them between the *cornea* and vitreous humour, are extinguished in the darkness thereof, that none may be propagated through the vitreous but such as passing through the pupil strike on the crystalline.

In the mean time the iris, contracting by its circular, or dilating by its right fibres, the *pupilla* of the eye admits fewer or more rays, as the object is nearer or more vivid, or remoter, and more languid. See PUPIL.

Now, the faster the figure of the *cornea* is, the less does it collect the rays emitted from any lucid point; whence fewer arrive at the crystalline, and those more diverg-

ing, unless when they come from a very remote object: on the contrary, the rounder it is, the more of the rays from any point does it collect, and throw on the crystalline, and those the more converging; whence one great cause of the defects in the eye both of old men and myopes. Again, the rays transmitted through the pupil to the crystalline are then refracted a-new, farther collected, and rendered converging; so that those which came from the same point of the object are now thrown in one point through the vitreous upon the *retina*, where they paint or exhibit that precise point of the object whence they flowed. Accordingly, if the crystalline be very dense or spherical, the focus, or the point wherein they are united, will be too near, and it too far, or rare, the point will be too remote, the effect of both which is confusion. And hence another cause of the defects of myopes and presbytes.

It is not, however, myopes and old men alone that would labour under these defects, and have their vision in most cases confused, as in objects very near or very remote, very small or very great; but this would be the common condition of vision. Distinct vision, depending absolutely on the union of all the rays coming from the same point of the object on the same precise point of the *retina*, and rays from the objects at different distances being united at different distances behind the crystalline; it were impossible, e. g. for the same eye to see distinctly any two objects differently distant from it: but nature has made a provision against these defects; and that principally by bringing the crystalline nearer to the *cornea*, or farther from it, occasionally; which is effected two ways, viz. either by compelling the bulk of the eye by the four muscles, all strongly contracted at once, which changes the figure of the aqueous humour, and renders the eye oblong; or by the *ligamentum ciliare* augmenting and diminishing the convexity of the crystalline, and setting it nearer or farther from the *retina*. As complex as the mechanism of the eye seems, and as manifold as the parts are which have a relation thereto, the justness of vision seems to require an exact habitude in them all: thus, though the pupil be no substantial part of the eye, but only an aperture of the *cornea* almost perpetually changing its bigness, according to the different degrees of light the eye chances to be exposed to; and therefore should seem, while this hole remains open, to perform its office, by giving entrance to the incident rays of light; yet Mr. Boyle saw a woman, who, after a fever, not being able to dilate the *pupilla* of her eyes as before, though they were little narrower than ordinary, yet had the thereby almost lost her sight; and on the other side, though a competent wideness of the pupil be requisite to a clear and distinct vision, yet if its dilatation exceeds the due limits, there is thereby produced a considerable distemper of sight. It may seem also but a slight circumstance that the transparent coats of the eye should be devoid of colour, and of so little moment that the *cornea* should be very smooth, provided it remain transparent; yet when either of these circumstances is wanting, the sight is greatly vitiated. Thus, we see that in the yellow jaundice the adventurous colour wherewith the eye is tinged makes the patient think he sees many objects yellow, which are of a contrary colour.

It has been of late an opinion, that though both eyes be open, and turned towards an object, yet only one of them, at a time, is effectually employed in giving the representation of it; so that the having of the two eyes should seem in some sort a redundancy. But Mr. Boyle furnishes several considerations which invalidate this opinion, and show that both the eyes are of use at the same time. He affirms us, he has found by frequent experiment, that his two eyes together beheld an object in another situation than either of them apart would do: he adds, that he has met with a person who had a cataract in his eye for two or three years, without finding any impediment in his sight, though others had, during that time, taken notice of a white film that crossed his eye, till at length happening to rub the sound eye, he was surprised to find himself in the dark; and that a very ingenious person, who, by an accident had one of his eyes struck out, told him, that for some months after he was apt to mistake the situation and distance of things; for having frequent occasion to pour liquors out of one phial into another, after this misfortune, he often spilt them, and let them run quite beside the necks of the phials, which he thought he was pouring them directly into.

The like was related to him by another person, who had, by a wound, lost the use of one of his eyes, viz. that for some time after, he often, in pouring out his wine, missed the mouth of the bottle or glass.

A yet more considerable instance of this kind the same author gives us of a noble person, who, in a fight, had one

EYE

of his eyes strangely mangled by a musquet-ball, which came out at his mouth: after which accident he could not well pour drink out of one vessel into another; but had broken many glasses by letting them fall out of his hand, when he thought he had given them to another, or set them down on the table: he added, that this aptness to misjudge of distances and situation continued with him, though not in the same degree, for two years. See VISION.

It is no uncommon thing for the *eye* to be terribly molested by extraneous bodies accidentally fallen into them, such as a bit of sand, a splinter of wood, the cutting of a quill, or of one's nails, a small insect, or the like. The most easy method of getting these bodies out is the opening and extending of the *eye-lid* with one's fingers, and agitating it, holding the head down; by this means the foreign bodies are often washed out of the *eye*, by the increased flux of tears, without much difficulty. If this does not succeed, the best method is next to blow some levigated crab-eyes, or the like fine powder, under the *eye-lid*; that this, being washed out by the tears, may carry also the other bodies out with it. Heister's Surg. p. 364.

The feed called *scelus Christi*, from its supposed virtue in clearing the sight, is very efficacious in such accidents. This it does by its viscous covering; for when any thing happens to fall into the *eye*, if one of these feeds is put in at one corner, and the *eye-lid* kept close over it, moving the feed gently along the *eye*, whatever happens to be there will stick to the feed, and so be brought out.

If all this fails, the *eye-lid* must be gently and carefully lifted up, and the offending body sought for, and carefully taken out with the end of a probe, or the like instrument. Or another method, is the dipping of a fine pencil-brush, or a small piece of sponge, tied to a small stick, into warm-water, and passing it under the *eye-lid*, and by that means pushing the offending matter out. Lard, or any other acrid substance, should always be washed out with milk or milk and water, and the *eye* after these accidents be washed with a collyrium made of rose-water, with a little of the white of an egg beat up in it, and a small admixture of saccharum saturni, or powder of tully; and if there be any considerable inflammation, it will be proper to bleed.

It is well known from inspection, and from the writings of anatomists, that there are two veins which run one on each side the nose, through the canthi majores, or great corners of the *eye*; these proceed partly from the forehead, and partly from the *eye*, and, like the frontal veins, discharge their blood down into the external jugular veins. Bleeding in these canthal veins has been approved of by all oculists for inflammations and other disorders of the *eye*, though perhaps with very little solid foundation. When this operation is to be performed, a stricture is made about the neck; and when the incision has been made, the patient must hold his head in a proper position for the blood to flow, without being troublesome to his *eye* or mouth; and when the necessary quantity of blood has been discharged, a thick triangular compress must be applied, and secured on with a proper bandage. Heister's Surg. p. 282.

EYES, running of the, in Infants. See INFANT.

EYES, scarification of the, is a chirurgical operation, by many confounded with that of bleeding in the *eye*, but improperly enough, since the parts of the operation are different; for bleeding is confined in this organ to the white of the *eye* alone, whereas scarification is practised as well upon the inner surface of the *eye-lid* as on the white of the *eye*; and they are also performed by different instruments.

This is no new operation, since Hippocrates, Celsus, &c. all prescribed it; but of latter ages it grew much into disuse.

To perform this operation, the patient is to be seated in a good light, and his head held still by an assistant, while the surgeon presses his thumb and fore-finger on the *eye-lids*, so as to open them and turn them outward, that their interior red surface may come into view: this is much more conveniently performed on the under than on the upper *eye-lid*. When the surface is thus turned up, the surgeon draws the scarifying instrument backward and forward over it with great swiftness, as also over the white of the *eye* if there be occasion, and by this means opens all the torpid vessels, and makes them bleed plentifully: this should be promoted by fomenting the *eye* with a sponge dipped in warm water. Heister's Surgery, p. 401.

When the operation is over, great care is to be taken that the wounded parts do not cohere together; the patient must move the *eye-lids* about at times to prevent this; and the *eye* when bound up at night must have a

EYE

piece of gold-beater's skin applied between the *eye-lid* and the *eye*.

Many different instruments have been used for making the scarification. Hippocrates used a prick of a thistle, and Celsus and Aegineta a flesh rasp. Others have chosen the stalks of the naked horie-tail, called shave-grass, which do very well; but the best of all instruments is a beard of barley or rye; these beards are furnished with rows of sharp teeth or hooks, and ten, twelve, or fifteen of these are to be cut and tied together by a string, so as to resemble a brush, the teeth of each beard being turned outward all round: their slender ends in this case form a sort of handle, by which the body of the brush may be moved about.

Eye, contusion of the. When the *eye* is by any accident contused, it will be entirely deprived of sight, unless the contusion be slight, or the proper remedies instantly applied. If the *eye* have received a very slight contusion, it will be proper to wash it frequently for the first day with cold spring-water, laying on it linen rags, wet with the same: on the next day it must be rubbed externally with camphorated spirit of wine, and covered up with flukes wrung out of decoctions made in wine, of *eye-bright*, speed-well, hyssop, sage, chamomile-flowers, and fennel-seeds; but if these things are not to be had, bolsters dipped in warm wine must be applied, and renewed very often; and if the patient be of a plethoric habit, bleeding is also necessary. If the contusion of the *eye* is so violent that you can plainly see the extravasated blood through the cornea, and all objects appear red to the patient, a vein must be either opened in the foot or neck; the *eye* must be kept continually fomented with warm flukes, wrung out of the same decoctions as are before mentioned, and the feet must be bathed in warm water two or three times a day, and a few drops of pigeons blood must be two or three times a day poured into the *eye*; and if all these attempts prove fruitless, you may very probably succeed by making an opening in the cornea with a lancet. Heister's Surgery, p. 116.

Eye, wounds of the. If the *eye* is wounded, but not so as to let out the vitreous or crystalline humour, the wound must be anointed two or three times a day with a feather or fine rag well dipped in the white of an egg, or else in a mucilage made of quince-seeds, or of flax-seeds, in rose-water; and after each dressing a compress is to be laid on, well saturated with a collyrium made of the whites of eggs; two ounces and a half of rose-water, half a dram of oil of roses, and three grains of camphor, well mixed together, and thoroughly shook up every time it is to be used. If the accident is attended with any great degree of inflammation, as is very frequently the case, it will be proper to cover the small compress, first laid over the *eye*, with a larger, dipped in warm spirits of wine, with camphor. The bowels must in this case be kept open, and the patient bled, if of a plethoric habit; and if it happen that the crystalline humour, or any part of it, flicks in the orifice of the wound, it must in this case be pulled out, that it may not bring on a deformity or worse mischief to the *eye*. Heister's Surgery, p. 90.

Eye, swelling out of the. See PROLAPUS oculi.

Eye, diseases of the, are an ophthalmia, or inflammation of the *eye*; the gutta serena, or amaurosis; a fistula, or catarrh; an ectropium; a glaucoma; an amblyopia, or obscurity of sight, including the myopia, the presbyopia, the nyctalopia, and the amaurosis; the strabismus, or squinting; an unguis pannus, or pterygium of the membrane of the *eye*; the albugo, leucoma, or spot in the *eye*; a fistulation of the *eye*; an epiphora, or rheum in the *eye*; a trichiasis; and the fistula lachrymalis. See each described under its peculiar denomination. See Warner's Description of the Human Eye, &c. with its principal Diseases, &c. 2d edit. 1775.

The comparative structure and anatomy of the *eye* is very curious; the situation, number, conformation, &c. of this organ in different animals, being finely and wonderfully adapted to their different circumstances, occasions, and manners of living.

In man, and some other creatures, an ingenious author observes, the *eye* is placed chiefly to look forward; but withal is so ordered as to take in nearly the hemisphere before it. In birds, and some other creatures, the *eye* are so seated as to take in near a whole sphere, that they may the better seek their food and escape danger. In others they are seated so as to see behind them, or on each side, whereby to see the enemy pursuing them: thus, in hares and conies, the *eyes* are very protuberant, and placed so much towards the side of the head, that their two *eyes* take in nearly a whole sphere; whereas in dogs that pursue them, the *eyes* are set more forward in the head, to look that way more than backward.

Generally, the head is contrived to turn this and that way

way chiefly for the occasions of the eyes; and generally the *eyelids* themselves are moveable upwards, downwards, backwards, and sideways, for the more commodious reception of the visual rays. Where nature deviates from these methods, she always makes use of very artful expedients to answer the same end.

Thus, in some creatures, the *eyes* are set out at a distance from the head, to be moved here and there, the one this way, and other that; as in snails, particularly, whose *eyes* are contained in their four protuberances, like arborescent spots fitted to the ends of their horns, or rather to the ends of those black filaments or optic nerves sheathed in the horn. Power, Exper. Phil. Obs. 31.

And in other creatures, whose *eyes* or head are without motion, and in divers insects, that defect is sometimes made up by their having more *eyes* than two; as in spiders, which having no neck, and consequently the head being immovable, the defect is supplied by the situation and multiplicity of their *eyes*; some having four, some six, and others eight, all placed in the fore-front of their head, which is round, like a locker of diamonds. The reason Dr. Power gives, is, that being to live by catching so nimble and prey as flies, they ought to see every way, and to take them *per saltum*, without any motion of the head to discover them.

Again, men, and most quadrupeds, are found to have several muscles belonging to their *eyes*, by help whereof they can turn them any way, and to obvert the organ of sense to the object. But nature not having given that mobility to the *eyes* of flies, she in recompence furnishes them with a multitude of little protuberant parts, finely ranged upon the convex of their large bulging *eyes*; so that by means of these numerous little studs numberless rays of light are deflected from objects placed on either hand, above or beneath the level of the *eye*, and conveniently thrown upon that organ, to render the objects they come from visible to the animal; and by the help of a good microscope, and a clear light, some hundreds of these little round protuberances may be discovered, curiously ranged on the convexity of a single *eye* of an ordinary flesh-fly.

So scorpions are found to have above a hundred eyes; and Swammerdam has observed no less than two thousand in the little insect called *epidemum*.

In other creatures the like deficiency is supplied by having their *eyes* nearly two protuberant hemispheres each consisting of a prodigious number of other little segments of a sphere.

The *eyes* of a camelion, Dr. Goddard observes, resemble a lens, or convex-glass, set in a versatile globular socket, which he turns backward and forward without stirring the head, and ordinarily the one a contrary way to the other.

Lastly, the mole, which the ancients, Aristotle, Pliny, Alb. Magnus, &c. supposed to have no *eyes* at all, is now found to furnish a notable instance of the diversity of the apparatus of vision; for that animal living altogether under ground, sight would generally be useless to it, and so tender a part as the *eye* trouble some. It has therefore *eyes*, but those so exceedingly small, and wishal situated so far in the head, and covered so strongly over with hair, that they cannot ordinarily be of service or disservice to it. Yet, to guide and secure it a little when it chanceth to be above-ground, Borrichius, Blasius, Schneider, Dr. Derham, and others, observe that it can proceed, or put them forth beyond the skin, and again draw them back at pleasure, somewhat after the manner of snails.

In the *eyes* of nocturnal animals is a part not yet mentioned, viz. a sort of tapetum at the bottom of the *eye*, which gives a kind of radiation on the pupil, enabling them to see and catch their prey in the dark. Thus, Dr. Willis, *Hujus visu est oculi pupillum quibus infans illuminatur quare in se plurimum illustris est; at homini, vobis et piscibus desit.* De Anima Brutor.

He adds, that in some persons the iris has a faculty also of darting out light; and influences in a man of a hot head who, after a plentiful drinking of generous wine, could see to read in the darkest night. Ibid.

The like Pliny tells us of Tib. Cæsar, that upon his first waking in the night he could see every thing for a little while as if in broad day-light. Nat. Hist. lib. xi. cap. 37. and Dr. Briggs gives a parallel instance of a gentleman in Bedfordshire. Opticæ. cap. v. §. 12.

Frogs, besides the parts of the *eye* which they have in common with men, and most quadrupeds, have a peculiar membrane or cartilage, which is not commonly perceived, wherewith they can at pleasure cover the *eye* without too much hindering the sight; because the membrane is both transparent and strong, so that it may pass for a kind of moveable cornea, or occasional safeguard to the *eye*. A like membrane is also found in many birds, as also in the crocodile.

Naturalists relate wonders of the sharpness and accuracy of the *eye* of some animals, as the eagle, &c. beyond those of men.

Yet do those of men seem improvable to a surprising degree. Mr. Boyle instances in a major of a regiment of King Charles I. who being afterwards forced abroad, ventured at Madrid to do his king a piece of service of an extraordinary nature; and consequence; which being there judged very irregular, he was committed to an uncommon prison or rather dungeon, having no window belonging to it, only a hole in the wall, at which the keeper put in provisions, and presently closed it again on the outside, but not perhaps very exactly. For some weeks this gentleman continued utterly in the dark, very disconsolate; but afterwards he began to think he saw some little glimmering of light; and this from time to time increased so, that he could not only discover the parts of his bed, and other such large objects, but at length, amidst this deep obscurity, could perceive the mice that frequented his chamber to eat the crumbs of bread which fell upon the ground, and discern their motions very well.

The author just mentioned, in his Observations on Visited Sight, gives us some uncommon phenomena that regard the *eye*. He furnishes several instances of nyctalopia, or people whose *eyes* in the day-time were quite dark, or at least so dim that they could hardly discern their way; who yet, soon after sun-set, and during twilight, saw very clearly.

Exts. of fish. These differ so much in their several kinds, that they make a very essential part in their description, and often are characters sufficient for distinguishing the species. Their differences are in regard to their figure, situation, proportion, and integuments. In regard to their figure, some are flat and depressed, as is the case in the greater number of fishes. 1. Some are convex, as in the case of the pleuronecti of many kinds; the *eyes* of these much resemble those of quadrupeds, the others are very different. 2. Some are rounder than ordinary, as in the cyprini, cyprinæ, percomyzæ, and lastly, some are oblong, as the *stomiæ*, the *cloacæ*.

These are the differences of the *eyes* of fish as to figure: in regard to their situation they differ as much: 1. In most fish they are placed in the sides of the head; instances of this position are sufficiently common. 2. In some they are placed both in the upper part of the head, as in the uranoscopes, or star-gazers. 3. They are in some placed very close to one another, as in the pleuronecti; and in others they are set at very remarkable distances, as in the clariæ. They differ also greatly in proportion, in respect to the body of the fish. Thus they are very small in the whales, and other cetaceous fishes; and they are as remarkably large in the apas, boops, and gasterosteus.

The *eyes* in fish differ also greatly in regard to their integuments. In some fish they are free, and are only covered with their proper membranes, as in the salmon, cyprini, &c. 2. They are in some covered in part with the skin of the head, as in the clupeæ, mackerel, &c. 3. In some they are wholly covered with the skin of the head as with a sort of veil. Examples of this kind there are in the lyngnathi, pleuronecti, percomyzæ, and others. The pupil of the *eye* is in most kinds of fish either round or oblong; but in some, as in the salmon and eel-gones, they run out into an acute angle in the anterior part. The colour of the iris in several fish is so very distinct that it makes a very obvious and distinctive character.

The *eyes* of almost all fish are without eye-lids, properly so called; but several kinds have, beside the membranes and common tunics, a sort of transparent membrane, with which the *eye* is in part at times covered. The cetaceous fishes, in particular, seem to have real eyelids: Tyson has demonstrated them in his accurate and excellent anatomy of the phocæna.

It is observed by Mr. Baker, that if the *eye* of fish are carefully examined when swimming in a glass vessel, the cornea or black uvea may be seen, sometimes advancing forwards, and at other times retreating back, just as their sight is directed to near or distant objects, through a grosser or finer medium; the form of their *eyes* shewing as occasion requires to make them distinct objects; and their *eyes* have so great a liberty in the orbits, that they are able to turn them any way, upwards, downwards, to one side or the other, nearly a quarter of a circle, which makes them full amends for the want of motion in their necks, and enables them to change the direction of their optic axis to any designed place in a moment. Phil. Trans. vol. xlv. p. 153.

Exts. of fish. Every naturalist has observed, that the *eye* of fish are of a reticulated texture; and each reticulated *eye* of this kind is truly an assemblage of multitudes, often

often of many thousands, of small but perfect *eyrs*. The reticulated *eyr* of flies is large, not only in proportion to the size of the creature, but absolutely, and in themselves; but the several small *eyrs* of which they are composed are remarkably minute in comparison of those of the butterfly class.

Many of the butterfly class have in each of their reticulated *eyrs* many thousand small *eyrs*; but the fly class greatly exceed them in number of these, as many of the *eyrs* of these are three times as large as those of the butterflies; and besides, that each smaller *eyr* is vastly more minute than the small *eyrs* of the butterflies.

Dr. Hook computed 14,000 hemispheres in the two *eyrs* of a drone; Mr. Leeuwenhoek reckoned 6236 in a silk-worm's two *eyrs* in its fly state; 3181 in each eye of a beetle; and 8000 in the two *eyrs* of a common fly. The pearl-*eyr* of the DRAGON-fly appear with a common reading-glass like green; and Mr. Leeuwenhoek reckoned in each *eyr* of this insect 12,544 lenses placed in an hexagonal position, each lens having six others round it. He also observed in the centre of each lens a minute transparent spot, brighter than the rest, supposed to be the pupil, surrounded with three circles, and in appearance seven times less than the diameter of the whole lens. Mr. Puget counted 17,325 in the *eyr* of a butterfly, which Malpighi concludes to be distinct and separate *eyrs*. The abbe Catalan, and others, have since shown that all the eminences discoverable in the corner of insects have the necessary parts, and perform the offices of an *eyr*. Leeuwenhoek discovered the bundles of optic nerves which serve these small lenses; and Reaumur supposes that these supply the place of all that is wanting behind the lenses, for the organization of an *eyr* complete for vision. Baker's Miscr. 1743, p. 228. Reaumur, Hist. Inf. vol. i. p. 261, &c.

That part of each side of the head of a fly which is cut, as it were, into a multitude of small facets, is one of the reticulated *eyrs* of the creature, and is usually somewhat elevated above the surface of the rest of the head; but differently, and of a different form and extent in the several different flies. Ibid. vol. iv. p. 239.

It is the custom of nature to allot two of these reticulated *eyrs* to each fly; and as they each contain such a vast multitude of smaller, but perfect *eyrs*, one would imagine this to be very sufficient for all the occasions of the animal. There are, however, notwithstanding, certain flies of the ephemeron or day-fly kind, which have four of these reticulated *eyrs*, two of which are placed as it were in the fly kind, and are but of small extent; the other two have each the appearance of a sort of turban, and are placed one beside the other upon the upper part of the head.

These have each much of the figure of a mushroom, the head of it extended a little beyond the flail, and the upper convex surface cut into almost an innumerable quantity of facets. Id. ibid. p. 240.

The first pair of the reticular *eyrs* of this fly which are placed as those of the other flies, are in colour brown; those of the mushroom form are of a very beautiful citreous colour, and as transparent as the most pellucid reticular *eyrs* of the other flies; for, among the various species of flies, some have these *eyrs* much more transparent than others.

The fly thus remarkably furnished with *eyrs* is produced from a worm of the same kind with the common species of ephemerons; its body is of a pale yellow, and its wings white; the two inferior ones of these are so small that they are not easily distinguishable.

Among the fly class these reticular *eyrs* are in different species of different colours; there are some which have them brown, others yellow, others green, and others red, and this in all the different shades of those colours.

Some of them have also the gloss of metals highly polished, others afford us a view of changeable colours, and others have arrangements of different colours, but those fixed and invariable. Id. ibid. p. 241.

The *eyrs* of one species of the gad-fly, so troublesome to oxen, have streaks of red, green, and brown, placed alternately.

One would imagine, that as every fly has two of these reticular *eyrs*, each composed of such a multitude of real *eyrs*, they could have no occasion for any *eyrs* beside these; but so it has not appeared to the great being that formed them, for they have, many species of them at least, other *eyrs* beside these.

The *eyrs* already described are properly called reticular ones; and to avoid confusion, it will be necessary to know the other *eyrs*, which are extremely different from those, by some determinate name. These other *eyrs*, when examined by the best microscopes, appear of a perfectly smooth, glossy, and polished surface, but plain and simple, without the least appearance of a reticulated texture.

These are also much smaller than the reticulated *eyrs*, and may therefore be called, by way of distinction, the smaller *eyrs*, or the smooth *eyrs*.

M. De la Hire seems to have been the first person who discovered these little smooth *eyrs* in the fly race. He observed three of them disposed in a triangular form, on the back part of the heads of these little creatures. When he found that three small convex shining bodies were usually situated in this part, he soon discovered that they were transparent, and thence naturally judged them to be of the same nature of the corner of our *eyrs*, and really to serve the same office to the creature possessed of them.

We find three of these smooth *eyrs* placed triangularly on the back part of the head of vast numbers of the genera of flies, as well of the two-winged as of the four-winged kinds; but there are also some flies of both these classes in which they are wanting.

All the species of gnats, and all the species of tipules, are without these smooth *eyrs*. The heads of these species of flies are very small in proportion to the bulk of their body, and are in a manner covered with their reticular *eyrs*, which in such a manner meet and touch one another, as to leave no room for occasion for the smooth *eyrs*.

These flies have the want of their small *eyrs* amply made up by the size and extent of the larger; but there are some other kinds which want them, without having this advantage in their place. Of the two winged flies with short bodies, the gad-flies want these *eyrs*; and among the longer bodied and four-winged kinds, the flies produced from the puccoon-eaters want them.

Notwithstanding, therefore, that many species of flies have these *eyrs*, there are yet so many that want them, that, if M. De la Hire's opinion, that the reticulated *eyrs* of flies were not true *eyrs*, held good, there must be very many of these insects blind.

Though most of the flies that have these *eyrs* have three of them, and those triangularly placed, yet there are some that have more, and some that have less than that number. A certain fly which has two filaments attached to the hinder part of its body, and its hinder pair of legs fastened to the annular portion of its body, has four of these smooth *eyrs* placed at the four corners of a square; the two anterior tolerably large, and the two posterior so small as to be scarce distinguishable. And other flies, as the papilionaceous ones, produced of water-worms, have only two of them. Ibid.

The position of these *eyrs* varies also in the different species of flies which are possessed of them; for though their usual place is in the hinder part of the head, there are some which have them before. Some species of the ephemerons have three of these *eyrs*, which may be called large in regard to their usual size in other flies. The one of these is placed in the middle of the forehead; the other two at the roots of the antennae, placed sideways by them, but a little more backward. This species has two reticular *eyrs* beside these, but they are smaller than is usual in that species of fly.

These *eyrs* are not peculiar to the fly class alone, some other of the insects which have reticular *eyrs* have these also, among which are the grasshopper, in which they are placed near the nose.

Notwithstanding that these *eyrs* are not well distinguished in flies without the assistance of glasses, they may, however, serve very well for the distinctions of genera among these species which have them. Id. ibid. p. 245.

These *eyrs*, though very small in themselves, yet, in comparison with the single *eyr*, which form the reticular fly, they are very large. See INSECT.

EYES of horses, in the *Manege*, &c. These should be bright, lively, full of fire, pretty large, and full; but not too big, goggling, or staring out of the head; they should also be resolute, bold, and brisk. A horse, to appear well, should look on his object fixally, with a kind of disdain, and not turn his *eyrs* another way.

In the *eyr* of a horse are discovered his inclination, health, and indisposition. When the *eyr* are sunk, or the *eyr*-brims are too much raised up, and as if were swelled, it is a sign of viciousness and ill nature. When the pits above the *eyrs* are extremely hollow, it is for the most part a certain sign of old age: this, however, does not hold of horses got by an old stallion; for these have them very deep at the age of four or five years, as also their *eyr*-brims and *eyr*-brims wrinkled and hollow.

Two things are chiefly to be considered in the *eyr* of a horse, viz. the crystalline part, and the bottom or ground. The crystalline, or most transparent part, should, for clearness, resemble a piece of rock-crystal, otherwise the *eyr* cannot be good. When this part is redish it is a sign that the *eyr* is inflamed, or else, as some pretend, influenced by the moon. When it is of the colour of a withered

withered or dead leaf upon the lower part, and troubled on the upper, it infallibly shews that the horse is lunatic, which distemper continues no longer than while the humour actually possesses the eye.

As to the ground or bottom of the eye, which is properly its pupil or apple, it should be large and full, and ought to be carefully inspected, that there be no *dragons*, as it is called, on it. This is a white spot or speck, which at first appears no bigger than a grain of millet, but grows to such a bigness as to cover the whole apple of the eye: it is incurable, never failing to make a horse blind in the eye where it is found. If the whole bottom of the eye be white, or of a transparent greenish white, it is a bad indication, though perhaps the horse is not as yet quite blind; however, it ought to be observed, that if you view a horse's eye when opposite to a white wall, the reflection of it will make these apples appear whilish, sometimes inclining to green, though they be really good. When this is perceived, you may try whether his eyes have the same appearance in another place.

In case you perceive above the bottom of the eye, as it were, two grains of chimney-foot fixed thereto, it is a sign the crystalline is transparent; and if, besides this, the said bottom be without a spot or whiteness, then you may infer that the eye is sound.

You ought also to examine whether an eye which is troubled and very brown be less than the other; for if it be, it is irrecoverably lost.

All eyes which are small, narrow, and have long pupils, run a greater risk of losing the sight than any others. See *BLINDNESS*.

The diseases of the eye in horses, proceed either from a defluxion, or from some external hurt. In the former case the eyes are watery, hot, red, and swollen, the distemper advancing by degrees; in the latter the malady comes suddenly to a height, and the skin on the outside of the eye is peeled off.

If the distemper takes its rise from a rheum or defluxion, it is to be considered whether it proceeds from the eye itself, or from another aggravated part: in the latter case, the redness of the part will let the eye free; in the former, it is proper to cool the horse's blood with an ounce of sal prunella, mingled every day with his bran; and when it lessens his appetite, to change it for liver of antimony, till he recovers his stomach.

For sore eyes, where a skin is growing over them, the following receipt is recommended: to the white of an egg add a little fine powdered salt; then set this on the fire till it be reduced to a powder. This mixed with a little honey, is to be put into the horse's eye with a feather. If it is found insufficient to eat off the skin, the powder alone must be blown into the eye with a quill.

In case of a blow on the eye, take honey; and having added a small quantity of powder of ginger, put it into the horse's eye; or else take hog's lard, with the oil of roses and elder, of each an equal quantity; then, having melted them together, anoint the eye therewith.

Some horses have naturally tender weeping eyes, which void a stary exuding humour; these are easily cured, by washing or bathing them every morning or evening with brandy. See *HORSE*.

We say also, a *horse without of one eye*, which is a rallying expression, importing that he is blind of an eye.

EYE of the branch of a bridle, in the Manege, is the uppermost part of the branch which is flat, with a hole in it, for joining the branch to the head-stall, and for keeping the curb fast.

EYE of a brow, in the Manege, is a black speck or mark in the cavity of the corner-teeth, which is formed there about the age of five and a half, and continues till seven or eight; and it is from hence that we usually say, such a horse marks fill, and such a one has no mark.

EYE, artificial, is an optical machine, wherein objects are represented after the same manner as in the natural eye, of considerable use in illustrating the nature and manner of vision.

Its construction is thus: provide two hollow hemispheres of hard, dry wood, well cemented together, to represent the ball of the eye; let the interior or fore-hemisphere be perforated with a round hole in C (Tab. Optics, fig. 9. n. 2.) to supply the place of a pupil, and therein fit a thin, plain glass, or, which amounts to the same, a concavo-convex glass, to serve for the cornea. In the inside put a short draw-tube G, with a lens convex on both sides, to do the office of the crystalline therein. In the hind, or posterior hemisphere, fit another draw-tube E F, with a plain glass therein, having its inner surface smooth, though not polished, representing the retina and optic nerve.

If now the aperture C be turned towards any object, and the draw-tube E F be gradually pulled out, you will have the object beautifully and strongly represented in all its

colours on the retina, only in an inverted order. See *VISION*.

It being of no consequence what the figure of the inner cavity is; any room or chamber to darkened as only to receive light from a single hole, with a glass convex on both sides fixed therein, will do the office of an artificial eye, and exhibit all the objects exposed to the aperture on a wall or a white cloth stretched at a proper distance from the aperture, with this circumstance, that the lens sphere the glass is a segment of, the larger will the figures appear; and this is the celebrated *camera obscura*. See *CAMERA obscura*.

EYE in perspective. See *PERSPECTIVE*.

EYE, attitude of the. See *ALTITUDE*.

EYE, in architecture, is used for any round window made in a pediment, an Attic, the reins of a vault, or the like.

EYE, bullock's, *Oculi bovi*, denotes a little sky-light in the covering or roof, intended to illumine a granary, or the like.

The same term is applied to the little luthern in a dome; as in that of St. Peter's at Rome, which has forty-eight in three rows. See *LUTHERN*.

EYE of a dome, denotes an aperture at the top of the dome; as that of the Pantheon at Rome, or of St. Paul's at London. It is usually covered with a lantern.

EYE of the universe, in disquisition, is the centre of the vortices, or that point wherein the helix or spiral wherewith it is formed, commences; or, it is the little circle in the middle of the vortex, wherein are found the thirteen centres for describing the circulations thereof. See *Tab. Astron. fig. 30. and fig. 29*. See also *VOLUTIN*.

EYE-lids, those pieces of leather which cover the eyes of coach-horses.

EYE, in Agriculture and Gardening, denotes a little bud or shoot inserted into a tree by way of GRAFT.

The term *eye*, *oculus*, is also used for a gem or bud, as it stands on the parent tree. See *BUD* and *PRUNING*.

EYE of a pear, the extremity opposite to its stalk. See *PEAR*.

EYE of a tree, a small point to which the leaves fly, and from which the shoots or boughs proceed.

EYE, in a ship. The hole wherein the ring of the anchor is put into the flank is called the *eye of the anchor*; and the compass or ring which is set in the flap to which any block is seized, is called the *eye of the flap*.

EYE of the flay, is that part of a flay which is formed into a sort of collar to go round the meat-head.

EYE-rod, is a long bar of iron with an eye in one end of it formed to be driven into the decks or sides of a ship for divers purposes, as to hook tackles, or fasten ropes to, as occasion requires.

EYE-let-hole. See *SAIL*.

EYES of a ship, a name frequently given to those parts which lie near the haub-holes, particularly in the lower apartments within the vessel.

EYE-sight, in Botany, *ophthalmia*, a genus of the *dichomania angustifolia* class. This is a medicinal plant which grows naturally in sterile fields and commons in moist parts of England. Its characters are these: the flower is of the perianth kind, divided into two lips, and having the upper one placed erect, and divided into several segments; the lower one divided into three principal segments, each of which is also bifid; the pistil arises from the cup, and is fixed in the manner of a nail to the back part of the flower; this finally opens into a capsule of an oblong shape, containing small seeds. There are two species. Tournef. Inst. 174. Linnaeus enumerates seven species.

These plants always grow among heath, furze, grubs, or some other cover, nor will they grow when these are cleared from about it, nor when town in a garden. The herb-women supply the markets with it in plenty from the fields.

Eye-sight is much recommended in disorders of the eyes, especially weakness and dimness of sight. It is given in several forms, but the powder of its leaves is thought most effectual as well as safest, the dose being from one to three drams.

EYE, among *Neurologists*, is sometimes also used for a hole or aperture; whence it is that the first of the larger intelligence is called *oculus*, or the blind eye, as having no eye or perforation. For a like reason the chemists call a close vessel used in distillation, a *blind head*.

EYE, in Printing, is sometimes used for the thickness of the types and characters used in printing; or most strictly, it is the graving in relief on the top of the letter; otherwise called its *face*.

It is the eye or face that makes the impression; and the rest, which they call the *body*, serving only to sustain it.

The eye of the *x* is the little aperture at the head of that character, which distinguishes it from the *e*. See *E*.

EYE is also used among Jewellers for the lustre and brilliancy

lance of pearls and precious stones, more usually called the *water*.

EYE-BROW, wounded. In wounds of this part great care must be taken to guard against inflammations, lest the *eye* should partake of the injury; all hot and sharp things must be avoided in eating and drinking; and the patient must be bled if plethoric; the wound must be dressed with vulnerary balsams, and the dressings covered with compresses dipped in camphorated spirit of wine. If the wound be large, and the *eye-brow* entirely divided, it will be necessary to tie the future and dress over it with a vulnerary balsam, covering both *eyes*, and keeping them as much as possible from motion. Heister's Surg. p. 79.

EYE-BROW, in Architecture. See FILLET.

EYE-LID, palpebra, in Anatomy, those external moveable covers which serve to screen and defend the *eye*.

They consist of a thin muscular membrane, covered on the outside with a strong, yet flexible skin, and lined within with a production, as some think, of the pericranium. Their edges are fortified with a soft cartilage, by means whereof they are enabled to close the better.

Out of these cartilages grow a palisade of stiff hairs, called *cilia*, of great use to warn the *eye* of the approach of danger, either in sleeping or waking; to keep off moths, flies, &c. in the air, and to break the too fierce impression of the rays of light.

These hairs, it is observed, only grow to a certain convenient length, and never need cutting, as most others do; add to this, that their points stand out of the way; those of the upper *eye-lid*, being bent upwards, as those of the lower downwards, so nice is nature in such small matters.

At the commissure, or joining of the upper and under *eye-lids*, are formed two angles called *canthi*.

In the inner of these is a gland called *glandula lachrymalis*, from which proceed two or three ducts, which, opening on the inner fornice of the *eye-lid*, serve to moisten the ball of the *eye*, and keep its membranes from growing harsh and dry.

Near the other angle is a gland called *innominata*, which helping also by several branches to irrigate the *eye*, the overplus is carried to the greater angle, and transmitted to the nose through the puncta lachrymalia.

By these glands it is that the humour, called tears, is secreted.

The *eye-lids* are both moveable, especially the upper, which has two muscles to raise and depress it, called *attolens* and *deprimens*, or *obscurens*. See ATTOLLENS and OBSCURENS.

In quadrupeds the lower *palpebra* is moveable, and is the smaller; in birds, on the contrary, the lower is moveable, and the greater.

Animals that have hard *eyes*, as lobsters, and the generality of fishes, have no *palpebra*, such eyes being sufficiently secured without.

In the generality of brutes there is a kind of third *eye-lid*, which is drawn like a curtain, to wipe off the humidity which might incommode the *eye*; it is called the *nictitating membrane*.

The monkey is almost the only one that wants it, as being furnished, like a man, with hands to wipe the *eye* on occasion.

EYE-LID, wounded. Wounds, either of the upper or lower *eye-lid*, will not readily heal, not so much from the thinness of the parts as from the great quantity of fluids with which the *eye* is continually moistened. It is necessary, therefore, first to foment the part with decoctions of chamomile, hyssop, or eyebright, till the flux of the blood is stopped, and the wound well cleansed; then if the wound is transverse, it must be stitched up in the middle with a fine needle, and sprinkled over afterwards with the powder of camphire-root, gum-arabic, or other such medicines, or anointed with balm of Gilead, or Peru, or Capivi, laying over these applications a plaster of diachylon, and tying it up in such a manner that the *eye* may have very little power to move about. If the wound is made lengthways it will require several stitches, and must be dressed over them as before. Heister's Surgery, p. 79.

EYE-GLASS, in our Double Microscope, is usually a lens convex on both sides; but Eustachia Divini long since invented a microscope of this kind, the power of which he places very greatly above that of the common sort; and this principally depending on the *eye-glass*, which was double, consisting of two plano-convex glasses, so placed as to touch one another in the middle of their convex surface. This instrument is spoken of with great credit by Fabri in his Optica, and is said to have this peculiar excellence, that it shows all the objects flat, and not crooked, and takes in a large area, though it magnifies extremely much. Phil. Trans. N° 40.

EYE-FLECK, in Natural History, a small sea-insect, which is sometimes found fixed by the snout to the *eye* of a fish,

whence it has received its name. It is about three inches in length, whereof the head is one quarter part. The body is somewhat thicker than a hop's bristle, and of a pleasant green colour. Phil. Trans. N° 472. § 7. et vol. xlii. p. 35.

EYE-WATER. See WATER.

EYE, white of the. See WHITE.

EYE-GLASS, in Telescopy, is the lens next the *eye*; and if the telescope consist of more than two lenses, all but that near the object are called *eye-glasses*.

EYE, Bull's, in Astronomy, a star of the first magnitude, in the constellation Taurus, by the Arabs called *Aldebaran*. Its longitude, latitude, &c. see among those of the other stars in the constellation TAURUS.

EYE, cat's, Oculus cati, in Natural History, a precious stone, called also *sun's eye*, *oculus solis*, and taken by Dr. Woodward for the alheria of the ancients.

It is transparent, of a glittering grey, interchanged with a straw-colour; usually oblong as to figure, and not unlike the opal, only much harder. It is found in divers parts of the East Indies; but those of the Island of Ceylon are the most prized. See ASTERIA and CAT'S *eye*.

EYE, crab's, Oculus cancerum. See CRAB'S *eye*.

EYE, goat's, Oculus caprini, is when there is a white speck on the pupil of the *eye*, as is seen in the *eye* of goats. Physicians call it *cataracta*.

EYE, golden, in Ornithology. See DUCK.

EYE, hawk's, Oculus sparrow, in Medicine, a discate arising from a contraction of the upper *eye-lid*, which prevents its being able to cover its part of the *eye*; so that the patient is obliged to sleep with the *eye* half-open, after the manner of hares.

Physicians call it *lagophthalmia*, a Greek word, signifying the same thing, being compounded of *lagos*, *hare*, and *ophthalmos*, *eye*.

EYESS, in Falconry. See FALCON.

EYRE, or LIRE, in Law, signifies the court of justices itinerant.

The word seems formed of the old French *irre*, *it*, *way* or *tract*.

Hence justices in *eyre*, are those whom Bracton calls *justitiorum itinerantes*.

EYRE of the parish, is otherwise called *justice-fee*, which by the ancient customs was to be held every three years by the justices of the bench, journeying up and down for that purpose.

EYRE, or AYRIE, among Falconers, the nest where hawks sit and hatch, and feed their young.

Hence, a young hawk newly taken from the nest is called an *eyre*.

EZEKIEL, a canonical book of the Old Testament, referring chiefly to the degenerate manners and corruptions of the Jews in the times when the author wrote. It abounds with fine sentiments and rich comparisons, and discovers much learning in profane matters.

Ezekiel was carried captive to Babylon with Jeconiah or Jehoiachin, and began his prophecy in the fifth year of the captivity, or in the year before Christ 595. He was contemporary with Jeremiah, who prophesied at the same time in Judah. He foretold many events, particularly the destruction of the temple, the fatal catastrophe of those who revolted from Babylon to Egypt, and the happy return of the Jews to their own land.

EZEKIEL'S reed, or rod, a scripture measure, computed by late writers to amount to 1 English foot 11 inches $\frac{1}{2}$ of an inch.

EZQUADUITL, a name by which some authors have distinguished the tree from which we have the common dragon's blood of the shops.

EZRA, or EZDRAS, in Divinity. The *Book of Ezra* is a book of Holy Scripture, composed in Hebrew by *Ezra* or *Ezdras*, the high-priest of the Jews during the captivity; and particularly about the time when they returned to Palestine, under the reign of Cyrus.

This book contains the history of the Jews from the time of Cyrus's edict for their return, to the twentieth year of Artaxerxes Longimanus. It specifies the number of Jews who returned, and Cyrus's proclamation for rebuilding the temple, the obstruction it met with, and the finishing thereof in the reign of Darius. It is canonical, and allowed as such both by the church and the synagogue.

The books of *Ezra*, called in the English version the *First and Second Books of Esdras*, though held by some, particularly the Greeks, for canonical, are thrown by the English church into the number of apocryphal books, being only extant in Greek.

The *Canon of Ezra* is the collection of the books of Scripture made by that pontiff. It appears, however, that the synagogue added other books to *Ezra's* canon; witness the book of *Ezra itself*, that of *Nehemiah*, and several others. See CANON.

F.

F, The sixth letter of the alphabet, and the fourth consonant.

The letter F may be either considered absolutely, and in itself, or with regard to the particular languages where it is found. In the first view, F is generally placed by grammarians among the semi-vowels, and distinguished in the enumeration of the alphabet by a name beginning with a vowel; though it has so far the nature of a mute that it is easily pronounced before a liquid in the same syllable. Joh. Conrad. Amman (in his *Dissertatio de Loquela*) divides the consonants into single and double, and the single into hissing and explosive. Among those called hissing, there are some pronounced by the application of the upper teeth to the lower lip; and these are the F and ph. The reason why some account the F a semi-vowel, and Amman places it among the hissing, is, that one may pronounce a little sound without any other motion of the organs than what is necessary to the pronunciation of the F.

In English, its sound is invariable, being formed by compression of the whole lips, and a forcible breath.

This letter is derived to us from the Romans, who borrowed it from the *Æolians*; among whom it is called *digamma*, or *double gamma*, as resembling two T's, one over the other; add, that the digamma seems in its origin to have been no other than the Greek ϕ , which being made at three strokes, degenerated at length into the figure F. For the letter ϕ being compounded of an omicron with a perpendicular drawn through it, if that perpendicular be made first, and the O at two strokes afterwards, viz. first the upper, then the under part, it may happen especially in writing, first, that the two parts shall not join; and even instead of two arches of circles, halts and inconvenience may naturally enough make two straight lines.

What confirms this transmutation of the ϕ into F, is, that on the medals of Philip, and the kings of Syria, in the words $\Phi\iota\lambda\iota\pi\pi\omega\varsigma$ and $\Sigma\iota\alpha\lambda\alpha\tau\alpha\phi\omega\tau$, the ϕ is frequently seen in the form just mentioned; i. e. it has no circle or omicron; but across the middle of the perpendicular is a kind of right line, formed only of two dots, the one on the right side, and the other on the left, representing a cross. Such appears to be the origin of the letter F, which of consequence is no other than a corruption of the Greek ϕ ; and accordingly, on the medals of the Falisci the F is ordinarily put in lieu of the Greek ϕ ; but it must be added, that though the Greek and Latin letter were thus the same thing, yet the sound was much softer among the Latins than among the Greeks, as was long ago observed by Terentianus.

The Romans for some time used an inverted F, a, in lieu of a V consonant, which had no peculiar figure in their alphabet: thus, in inscriptions we meet with *TERMINAVIT, DIVI, &c.* According to Lipsius, in his Comment on the *Annals of Tacitus*, lib. xi. *Corruvius* and *Douglivius*, this inverted digamma was first introduced by the emperor Claudius. See Tacit. An. lib. xi. cap. 4. and Suet. in Vit. Claud. cap. 41.

It may be added, that the pronunciation of the F is almost the same with that of the V, as will be evident by attending to the manner of pronouncing the following words: Favour, Family, Felicity, Vice, Foment, Pledge, &c. The French, particularly, in borrowing words from other languages, usually turn the final a into an f, as *cheval* of cattivo, *neuf* of novus, *nef* of navis, &c.

In the later Roman writers we find the Latin F and Greek ϕ , frequently confounded; as in *Filanus* for *Philanus*, *Philosophus* for *Philosophia*, &c. which abuse is still retained by many French writers, who write

Philosophie, *Philippe*, *Epifane*, &c. and even sometimes by the English, as in *fantasy*, *filice*, &c.

F, in the *Calendar*, is the sixth dominical letter.

F, in the *Crest* *Leop.* Two f's joined together signify the *Pandects*; see the reason of this under *PANDICTS*.

F, in our *Antient Customs*, was a stigma or brand.

He that shall maliciously strike any person with a weapon in church or church-yard, or draw any weapon there with an intent to strike, shall have one of his ears cut off; and if he have no ears, he shall be marked on the cheek with a hot iron having the letter F, whereby he may be known for a *fray-maker*, or fighter.

F, or FA, in *Music*, denotes the bass-clef, being placed on the fourth line upwards.

Indeed the character or sign by which the f and c clefs are marked bear no resemblance to those letters. Mr. Malcolm thinks it were as well if we used the letters themselves; but custom has carried it otherwise. The ordinary character of the f, or bass-clef is C , which

Kepler takes a great deal of pains to change by corruption from the letter *fa* into C .

F, in the *Italian Music*, is often used instead of *forte*.

FF, in the *Italian Music*, stands for *forte fero*, and intimates to play very strong and loud.

F, in *Physical Percriptions*, stands for *fat*, let it be done, as F. S. A. denotes as much as *fat secundum artem*.

F, among such as give us the numerical value of letters, signifies 40, according to the verse

Sexta quaterdecim gerit quæ distat ab alpha.

And when a dash was added over it, F signified 40,000.

F, on the *French Coin*, is the mark of the town of Angers.

FA is one of the notes of music, being the fourth, rising in the order of the gammas, *ut, re, mi, fa*. See NOTE.

FABA, in *Botany*. See BEAN.

FABA *Bergensis*, in the *Materia Medica*, a soundly compressed substance, about an inch in diameter, brought from Bengal, and thought to be a vitiated fruit of the myrobolans kind. It is a very good aliment, and therefore prescribed with good success in fluxes and hemorrhages.

FABA *Græca*, in *Botany*. See *Indian Date PLUM*.

FABA *St. Ignatii*, in the *Materia Medica*. See *NUX EMULICA*.

FABA *gargaris*, in the *Materia Medica*, the fruit of a species of *vicinia*. See *PALMA Christi* and *CAYENNE*.

FABACIUM, a word used by the ancients to express a sort of food then in use, which was a kind of cake made of bean-meal.

FABAGO, in *Botany*. See *BEAN-CAPER*.

FABALIS *Lapis*, in *Natural History*, a stone mentioned by many ancient authors of repute as found in the river Nile, of the shape of a common bean, and of a black colour. They say it had the virtue of curing demoniacs, and that dogs did not bark if it was laid before them. These, and many other like virtues, are attributed to this stone, to the great disgrace of the sober authors who relate them. The stone seems to have been of those extraneous fossils which Dr. Hill has styled *ICHTHYPERIA*, from their having been formerly parts of the bony palates of fishes which feed on the shell-fish kinds; and other authors *ILIQVASTRI*, from their resembling the pod of the lupine or bean.

FABANIA, in *Botany*, a name given by some authors to the telephium or *ORFIVE*, and by which it is in some places called in the shops.

FABARIA *calenda*, among the Romans, the calends of June, so called because the beans being then first ripe, some of them were offered to the goddess *Carna*, the wife of *Janus*.

FABATARIUM, among the ancients, signifies, according to some, a large vessel in which beans were kept; others will have it to have been a kind of dish or plate into which bean-pulse was put and offered to the household gods.

FABER, in *Ichthyography*. See **DORIS**.

FABIANUS, **FABII**, in *Antiquity*, a part of the **LUPERTI**. Those priests consisted of two colleges, the first of which was called the *Fabii*, and the second the *Quintilii*, from their respective chiefs. The *Fabii* were for Romulus, and the *Quintilii* for Remus.

FABLE, a tale or feigned narration, designed either to instruct or divert; or, as Mont. de la Motte defines it, an instruction disguised under the allegory of an action.

Fable seems to be the most ancient way of teaching: the principal difference between the eloquence of the ancients and that of the moderns consists, according to Pere Boissac, in this; that our manner of speaking is simple and proper, and theirs full of mysteries and allegories: with them the truth was usually disguised under those ingenious inventions, called by way of excellence, *myths*, *fabulae*, *fables*; that is, words, as intimating that there was the same difference between these *fabulous* discourses of the learned and the common language of the people, as between the words of men and the voices of beasts.

At first *fables* were only employed in speaking of the Divine Nature, as then conceived; whence the ancient theology was all *fable*. The Divine attributes were separated as into too many persons, and all the economy of the Godhead laid down in the feigned relations and actions thereof; either because the human mind could not conceive so much power and action in a single and indivisible being; or, perhaps, because they thought such things too great and high for the knowledge of the vulgar; and as they could not well speak of the operations of this Almighty Cause without speaking likewise of its effects, natural philosophy, and at length human nature, and morality itself, came thus to be veiled under the same *fabulous* allegoric expression; and hence was the origin of poetry, and particularly of epic poetry.

The critics after Apollonius and Theon reckon three kinds of *fables*, rational, moral, and mixed.

FABLES, rational, are called also parables: these are relations of things supposed to have been said and done by men, and which might possibly have been said and done, though in reality they were not. Such, in the sacred writings, are those of the ten virgins, of Dives and Lazarus, the prodigal son, &c. Of these rational *fables* we have likewise about a dozen in *Phædrus*.

FABLES, moral, called also apologues, are those wherein not only beasts, but trees, and other inanimate substances, are introduced as actors and speakers. These are also called *Æsop's fables*; not that *Æsop* was their inventor, for they were in use long before him, viz. in the times of Homer and Hesiod, but because he excelled in them. Such was *Jotham's Fable of the Trees*, the most ancient of any that are now extant.

The *rational* differs from the *moral* *fable* in this; that the former, though it be feigned, might be true; but the latter is impossible, as it is impossible for brutes or stocks to speak.

FABLES, mixed, are those composed of both sorts, rational and moral, or wherein men and brutes are introduced conversing together. Of these we have a fine instance in *Julian*, lib. xxiii, cap. 4, made by a petty king to alarm the ancient Gauls against the Massilians, who, arriving out of Asia into Spain, charmed with the place, begged leave of the inhabitants to build a city. To this effect: A bitch big with young begged of a shepherd a place to lay her whelps in; which when he had obtained, the shepherds begged for leave to rear them there. At length the whelps being now grown up, depending on the strength of her own family, she claimed the property of the place. So the Massilians, who are now only strangers, will hereafter pretend to be the masters of this country.

As to the laws of *fable*, the principal are, 1st. That to every *fable* there be some interpretation annexed, to shew the moral sense or design thereof. This interpretation, if it be placed after the *fable*, is called *variorum*, or *apophoreta*; if before it, *apophoreta*, or *prophæticum*. 2^d. That the narration be clear, probable, short, and pleasant. To preserve this probability the manners must be expressed and closely kept to, as in poetry. See **PROBABILITY** and **MANNERS**.

M. de la Motte has some fine remarks on the subject of *fables*, at the beginning of his *Fables Nouvelles*, dédiées au Roi, 1719. A *fable*, according to this polite writer, is a little epic poem, differing in nothing from the great one but in extent; and in that being less confined as to the choice of its persons, it may take in all sorts at pleasure, as gods, men, beasts, or genii; or even if occa-

Vol. II. N° 124.

don be, create persons; i. e. personify virtues, vices, rivers, trees, &c. Thus, M. de la Motte very happily introduces virtue, talent, and reputation, as persons making a voyage together. See **EROPHORIA** and **PERSONIFYING**.

That author suggests two reasons why *fables* have pleased in all ages and places. The first is, that self-love is spared in the instruction. The second, that the mind is exercised by the allegory. Men do not love direct precepts; too proud to condescend to those philosophers who seem to command what they teach, they require to be instructed in a more humble manner; they would never amend, if they thought that to amend were to obey; add, that there is a sort of activity in the mind which must be humoured; it pleases itself in a penetration which discovers more than is shown; and in apprehending what is hid under a veil, fancies itself in some measure the author of it. The *fable* must always imply or convey some truth; in other words, delight alone may suffice; but the *fable* must instruct. Its essence is to be a symbol, and of consequence to signify somewhat more than is expressed by the latter. This truth should for the generality be a moral one; and a series of fictions conceived and composed in this view would form a treatise of morality preferable to any more direct and methodical treatise; accordingly, Socrates, we are told, had a design to compose a course of morality in this way. This truth should be concealed under the allegory; and in strictness, it ought not to be explained either at the beginning or end.

The truth or idea intended should arise in the reader's mind from the *fable* itself. However, for the convenience of the less discerning readers, it may be a good way to point out the truth or moral in precise terms. To have the moral at the end of the *fable* seems much better than at the beginning; the mind is apt to be forestalled in the latter case; I carry the key along with me, so that there is no room to exercise my mind in finding any thing myself.

The image, M. de la Motte observes, must be just, and express the thing intended directly, and without any equivocal: it must be one; i. e. all the parts must be visibly accessory to one principal end: and it must be natural; i. e. founded on nature, or at least on opinion.

The writers of *fables* are not many. If there were any before *Æsop*, who lived in the time of Solon, about the fifty-second Olympiad, his success has quite effaced their memory; and even occasioned all the good things of that kind to be ascribed to him. His life, as written by *Plutarch*, is itself a thorough *fable*. It must be owed to be very happily imagined to make the inventor of *fables* a slave, and his master a philosopher: the slave has his master's pride and ill humour to deal with throughout. His lessons were all contained in the *fables* themselves, and the readers were left the pleasure of discovering them.

It is generally allowed among the learned, that though the matter and invention of the *fables* be *Æsop's*, the turn and expression are not. The Greek is of *Plutarch*, and had Greek it is, in the judgment of F. Vassier, De *Ludica Dialect.* Some authors will have Socrates the author of the *Fables of Æsop*; others attribute them to Solon, and others to Homer.

Phædrus was a slave too, and a freed-man of Augustus; but he had the advantage over *Æsop* in education: he is only a *fabulist*, as he translates and copies. Though his *fables* be generally short, yet he is prolific compared with his author. His style, however, is always solid, his descriptions concise, and his epithets suitable: he frequently adds graces never dreamt of by the inventor, and everywhere enriches the simplicity of *Æsop* in the most delicate manner.

Piræus, another *fabulist*, governed *Isotolus* a long time under a powerful empire; but he was not the less a slave, for the prime ministers of such princes are always more to them the meanest subjects. *Piræus* comprised all his politics in his *fables*; and accordingly his work long continued the book of state, or the discipline of *Isotolus*. It was translated into Persian and Arabic, and since into the modern languages. His *fables*, M. de la Motte observes, are rather famous than good; but he is the inventor, and the merit of invention will always compensate for many faults. His *fables* are often wild and artless; and the collection is a sort of romantic assemblage of men and genii, composed in its kind like *Cyrus* or *Orlando*, where the adventures are continually thwarting and clashing with each other.

We say nothing of the *fables* of *Gabrius*, or *Barbarus*. *Athenius*, who lived towards the end of the fourth century, under the empire of *Gratian*; *Athenius*, &c. Among the moderns, the most celebrated writers are *Mess. de la Fontaine* and *De la Motte*: the first of whom has picked

but all the best things in *Aleop*, Phœnix, and *Pitay*, are given them, now in French, with a delicacy and simplicity peculiar to himself; and which, in the judgment of his countrymen, has him even above Phœnix. The latter, rather than content himself with what De la Fontaine had left, chose to be an inventor. He has succeeded. His *fables* are many of them very happy, though some think them too full of thought and reasoning. His versification is infinitely more correct than that of La Fontaine, and more suitable to the subject than that of Le Noble.

We have likewise some *fables* much esteemed of Mr. Gay and Mr. Moore.

FABLE is also used for the plot of an epic or dramatic poem, or the action which makes the subject of such a poem or romance. See **POEM**, **DRAMA**, **EPIC**, and **ACTION**.

The *fable*, according to Aristotle, is the principal part, and as it were the soul of a poem. It must be considered as the first foundation of the composition, or the principle which gives life and motion to all the part. In this sense the *fable* is defined, "A discourse invented with art, to form the manners by instructions, disguised under the allegory of an action."

The *epic fable*, according to Boile, is confined to the rational kind; i. e. the actors and persons are to be gods and men; and yet it admits of great latitude: it may be either grave, illustrious, and important, or low and popular; either whole or defective, in verse or in prose; much epifodized, or brief; rehearsed by an author, or represented by actors on the stage; all which are so many circumstances which do not make any alteration in the nature and essence of the *fable*.

The characters that specify the *epic fable* are these: it is rational and probable; it imitates a whole and an important action; and it is long and related in perfection of which properties affect the nature of the *fable*, or make it less a *fable* than those of *Aleop*.

The *fable*, according to Aristotle, consists of two essential parts, viz. truth, as its foundation; and fiction, which disguises the truth, and gives it the form of *fable*. The truth is the point of morality intended to be inculcated; the fiction is the action, or words the instruction it covered under.

To make a plot or *fable*, the first thing, according to the great critic just mentioned, is to pitch on some moral instruction to be exemplified.

E. g. I would exhort two brothers, or other persons, who have some common interest, to live in unity, in order to preferre it. This is the end of the *fable*, and the first thing I have in view. In order to this, I endeavour to impress this maxim on our minds, that "if understanding ruins families, and all kinds of society." This maxim is the moral or truth which is to be the ground of the *fable*, which moral truth is now to be reduced into action, and a general action to be framed from several single and real actions of such as were ruined by ill understanding.

Thus, e. g. I say, that certain persons united together for the preservation of something that belonged to them in common, coming to disagree, their division left them open to an enemy who ruined them: such is the first plan of a *fable*. The action presented by this narration has four conditions; 1. it is universal, imitated, feigned, and contains a moral truth under an allegory.

The names given to the several persons begin to specify the *fable*. *Aleop* uses those of brutes. Two dogs, says he, appointed to watch a flock, fall out, fight, and leave all open to the wolf, who carries off what he pleases.

If you would have the action more singular, and render the *fable* rational, take the names of men. Pridamant and Oronotes, brothers by a second venter, were left very rich by their father's will; but disagreeing about the partition of their effects, they engaged themselves to far against each other that they took no care of their common interest against Citander, their eldest brother by the first venter, which last, artfully inflaming their quarrel, and feigning he had no view but to some moderate augmentation, which might be made him without oppressing them, in the mean time, gets the judges on his side, and the other person entrusted with the affair, procures the will to be affirmed, and becomes entitled to the whole estate about which the brothers were at variance. Now, this *fable* is rational; but the names being feigned as well as the things, and before the persons being only of a private rank, it is neither epic nor tragic. However, it may be employed in comedy, it being a rule laid down by Aristotle, that epic and tragic poets only invent things, but comic poets invent both names and things. See **COMEDY**, &c.

To accommodate this comic *fable* more to the mode and taste of the town, some Donada must be imagined to

have been promised to Citander; but her father, finding him disinclined by the will, changes his resolution, and will have her marry one of the rich, tender, young brothers, whom she detests, &c.

But to return. The fiction may be so different with the truth of history that there shall not appear any fiction at all. To effect this the poet looks back into history for the names of some persons to whom the feigned action either really, or probably did happen, and reverts it under those known names, with circumstances which do not change any thing of the ground of the *fable*.

As for the *fable*, it matters but little whether the persons be called dogs, or Croton, and Pridamant, or Robert of Anjou and Ralph de Nefse, or Achilles and Agamemnon.

The *epic fable* we shall now propose in its full extent under these two names last mentioned. It is too short for the epopœia in the two preceding ones. We choose the *fable* of the Iliad, as being the first plan of an epic poem in the world, and at the same time the most useful system of the precepts of the art, it being hence that Aristotle was furnished with all his reflections.

In every different undertaking the end is the first thing proposed; and by this the whole work and all its parts are regulated; consequently, the design of the epic poem being to form the manners, it is with this first view the poet must begin. Now, the philosopher dwelling on

virtues and vices in general, the instructions he gives serve equally for all states and all ages; but the poet has a more immediate regard to his countrymen, and the pressing occasions of his fellow-citizens. On this view it is that he chooses his moral, which he fits to inculcate into the people by accommodating it to their peculiar customs, genius, and inclinations. See how

Homer has acquired himself in it, and proposed.

He saw the Greeks, who were at that time divided into many states, and that the Greeks were at a battle, &c. and had the government of the Greeks in their hands. Yet were these different states united to defend one another

one body against the common enemy, the Trojans. And were two laws of government so different to be so unanimously joined in the same plan, the poet accordingly had recourse to two *fables*; the one for all Greece, considered as confederated together, only consisting of independent parts; the other for each particular state, such as they are in time of peace, and without the first relation.

The first is the subject of the *ILIAD*, the second of the *ODYSSEY*.

For the first kind of government, all experience agrees that the only thing which can render it happy, and insensible successful, is a good understanding, and due subordination among the several chiefs that compose it; and that misunderstanding, a source of envy, &c. are the inevitable base of such confederacies. The best instruction therefore that could be given them, was to reflect on their eyes the destruction of the people, and even of the princes themselves, through the ambition and discord of these latter. Homer therefore, for the ground or moral of his *fable*, chose this great truth, that the misunderstandings of princes ruin their states. "I find," says he, the wrath of Achilles, so fatal to the Greeks, and which destroyed so many persons, occasioned by a disagreement between King Agamemnon and that prince."

To enforce this truth, he represents divers confederate states first at variance and unsuccessful; then reconciled and victorious; all which he does includes in one universal action. Several independent princes league against a common enemy; he whom they choose as their leader assumes the bravest of all the confederacies; upon which the offended prince withdraws, and refuses any longer to fight for the common cause. This misunderstanding gives the enemy so much advantage that the confederates are ready to relinquish the enterprise. The distracted person himself becomes a danger in the calamities of his allies, one of his chief friends and favorites being killed by the chief of the enemies. Thus both parties, grown wise by their own injury, are reconciled. Upon which the valiant prince, going again in the war, turns the scale to his own party, and kills the enemy's chief.

Such is the first general plan of the poem. To render this probable and more interesting, circumstances of time, place, persons, &c. are to be added; that is, the poet looks into history or tradition for persons to whom such actions may with truth or probability be ascribed.

He pitches on the siege of Troy, and to person the action to have passed there. The brave, choleric character, he calls Achilles; the general, Agamemnon; the chief of the enemies, Hector, &c.

To instruct himself into his readers, he accommodates himself to their manners, genius, views, &c. and to render his *fable* more interesting,

teaching, makes his chief persons, and those who remained victorious, to be Greeks, the fathers of those very people. The course of the work is filled up and extended with other useful lessons and instructions. That the epopeia in all its glory is justly and strictly a mere *fabule* in the same sense as the fictions of *Aloop* are, is shown by P. Boffa, in a parallel between the *fabule* of the Iliad and that of *Aloop* already mentioned. The moral instruction is visibly the same in both; so is the fiction. All the difference lies in the names and qualities of the persons.

Homer's are kings; he calls them Achilles, Patroclus, &c. and the general good to be preserved, he calls the Greeks. *Aloop*, after his manner, gives his persons the names of beasts; the dogs are considered, the wolf is their enemy; and what Homer calls Greeks, *Aloop* calls sheeps. One says, that while the confederate princes were at variance, Hector rushes on the Greeks, and makes them pay dear for the folly of their forefathers (*admirant reges, postulat Achiv*); but that the allies, brought by misadventure to themselves again, re-unite, repulse Hector, and kill him. The other, that while the dogs are together by the ears the wolf falls on the sheeps; and that the dogs, fearing the havoc he makes, join together, drive him away, and kill him.

The two *fabules* were capable of a still nearer resemblance. Homer has extended his by long speeches, descriptions, comparisons, and particular actions; that of *Aloop* might be amplified after the like manner, without corrupting or altering it. It is necessary only to relate what cause set the dogs at variance, and shew the rise of the fatal wrath in all its circumstances; to make fine descriptions of the plain wherein the sheep fed, and of some neighbouring wood where the wolf was sheltered; to give this enemy whips to *tear*, make them follow their fire in search of prey, and describe the carnage they make at diverse expeditions. Nor should the genealogy of the heroes be forgotten; the wolf that boast himself a descendant of Lycus, and one of the dogs be sprung in a direct line from Canis; which fall would be the proper hero of the poem, as being just, and apt to be engaged. He would represent the person of Achilles to admiration; and the folly of some Ajax, his cousin, would afford a good proof of *divine* extraction. Nothing more were required to engage heaven in the cause, and divide the gods; which, no doubt, have as much right in *Aloop's* republic as in the states of Homer. Witness Jupiter taking care to give a king to the nation of the frogs.

The reader has here field enough for an epopeia; if he have any thing of fancy and expression, and do but take care to repeat as often as Homer does,

The *fabule* is a *fabule* of *fabule* and *fabule* and *fabule*.

FABRIC, the structure or construction of any thing, particularly of a building.

The word is formed of the Latin, *fabrica*, which originally signifies a *smith's shop*, or *forge*.

In Italy the word *fabrice* is applied to any considerable building; in France it rather signifies the manner of building.

FABRIC, lands given towards the maintenance, rebuilding, or repair of cathedrals or other churches, mentioned in the Act of Oblivion, 12 Car. II. cap. 5. In ancient time almost every one gave by his will more or less to the *fabrics* of the cathedral or parish-church where he lived.

FABULOUS, denotes something that has a relation to *FABLE*. Vario divides the duration of the world into two earlier fables or periods, called the *dark* and *fabulous*. See *AGE*.

FACE, the surface or front side which a body presents to the eye. See *SURFACE*.

FACE is particularly used for the visage of an animal, and especially of a man, as being to him the only part of the body that ordinarily appears to the eye.

The Latins call it *facies*, *velut*, &c.

The great variety observable in men's faces, voices, and hand-writings, furnishes a noble argument of a Providence.

The human face is called the image of the soul, as being the seat of the principal organs of sense; and the place where the ideas, motions, &c. of the soul are chiefly set to view. Pride and disdain are shewn in the eye-brows, modesty on the cheeks, majesty on the forehead, &c. It is the face which shews the sex, age, temperament, health, or disease, &c.

The face, considered as the index of the passions, habits, &c. of the person, makes the subject of physiognomy. Anatomists usually divide the face into two parts, the upper and lower; the upper is the front, or forehead; the lower includes the eyes, nose, ears, mouth, cheeks,

and chin. See each part described under its respective article.

FACE, or *FACADE*, in architecture, is sometimes used for the front of a building, or the side by which the chief entrance is; as also for the side it presents to a street, garden, court, &c. and sometimes for any side opposite to the eye.

FACE, *FACIA*, or *FACETA*, also denotes a flat member having a considerable breadth, and but a small projection.

Such are the bands of an architecture, larnier, &c. See *FASCIA*.

FACE of a stone, is the surface or plain part which is to lie in the front of the work. The face is easily known when the stone is squared, as being always opposite to the back, and the back going rough as it comes from the quarry.

The workmen generally choose to make one of those sides the face, which, when in the quarry lay perpendicular to the horizon, and consequently the breaking, and not the cleaving way of the stone.

FACE of a gun, in *Artillery*, the surface of the metal at the extremity of the muzzle of a piece.

FACE, in *Astronomy*, is used for the third part of a sign. Each sign is supposed to be divided into three faces: the ten first degrees compose the first face; the ten following ones the second; and the last ten the third. Venus is in the third face of Taurus; that is, in the last ten degrees thereof.

FACE of a plant, in *Botany*, a word used by Tournefort and many botanists to convey an idea of that general appearance of plants, which shew a likeness in those of the same genus, and a diversity from other genera, though not easily characterized in words, yet very obvious to an eye accustomed to these resemblances. Thus, all the species of wormwood have the same face, by which they may be taken to be the species of the same genus, and so of many more; nay, in some cases, whole genera, and even classes, have the same kind of *family-face*, as it may be called, by which they may be known; as the umbelliferous plants, except the *perfoliata*, and a few other instances.

It has been attempted by many to make this general face an indicative note of the virtues of the plant which wears it; and there would certainly be this great advantage in it if it could be brought to any degree of certainty, that the most obvious of all distinctions would be applied to the most valuable office; but though an absolute certainty cannot be arrived at in an attempt of this kind, yet allowing for the possibility of a few exceptions, general conjectures may be made on the following rules, which will rarely fail. The umbelliferous plants before mentioned make a very large class; and it is their general and obvious character to have their fegetal flower-branched arise from one centre, and expand into an umbella; every one having a tuft of flowers at the end; the flowers consist of five leaves, and the seeds are naked and double, and the leaves of the plants are generally deeply divided, as in parsley, carrot, and the like.

This is a general face of a plant not easy to be mistaken; and all the plants which have this face are endowed with the virtues of carminative medicines. They expel wind, and are good in the colic, and other like diseases. The seeds of most of these are used, and some of the roots. The seeds of anise, caraway, cummin, and the like, are all seeds of umbelliferous plants; and the root of *regelia* is another instance of their efficacy. But as an exception to this general rule, the hemlock, and hemlock-droop may be produced, which are poisons.

The *verticillate* plants are another class, which are easily known by their general face; their flowers standing in single rows round the stalks, and being lobed, or of some such form. The leaves also in most of these plants stand in pairs, and they have generally an aromatic smell. As the virtues of the *umbelliferae* lie in the roots and seeds, so do those of the *hulkae* of the flowers. It has been a common opinion, that the flowers of these plants contained their virtues, but this is erroneous. The flowers of sage are almost insipid, but the *hulkae* taste very strongly. These plants in general are possessed of the same virtues, and are all of a middle degree between the carminatives before mentioned and the spices. They are properly aromatics, and are all good in nervous distempers, as epilepsies, palsies, and the like: one of them, which is called mother of thyme, is alone a remedy for the nightmare, a troublesome disease, that often baffles other medicines; and the flowers of rosemary, lavender, sage, and the like, may shew as instances of the virtues of this class; and mint, pennyroyal, hyssop, &c. in their leaves are of great virtue, and a pleasant flavour.

The *silique* plants have also a general face. Their flowers

flowers are composed of four leaves, and their seeds contained in long pods, or in short and thick siliques. In these plants the seeds are found to contain the principal virtue in some, and in others the leaves; some have also virtue in their roots, but the flowers of all are neglected. Mustard, cress, and the like, have their virtue in the seeds, and scurvy-grass in its leaves, horse-radish in the roots; yet all have the same general virtue; they are hot like the two last tribes, but they exert their power in a very different manner; as it consists in a diuretic volatile salt; and they are all good in the scurvy, dropsy, jaundice, &c. and have been used in these cases at all times. Philo. Trans. N° 355, p. 120. See BOTANY.

FACES of a *balloon*, in *Fortification*, are the two foremost sides reaching from the flanks to the point of the balloon where they meet.

There are commonly the four undetermined, because they reach farthest out, and are the least flanked, and therefore weakest. They are represented by the lines BC and SC, Tab. Fortif. fig. 1.

FACE of a *plate*, denotes the interval between the points of two neighbouring balloons, containing the curtain, the two flanks, and the two faces of the balloons that look towards one another.

This is otherwise called the *TENAILL* of the place.

FACE prolonged, in *Fortification*, is that part of a line of defence raised, which is between the angle of the epaule or shoulder of a balloon and the curtain; or the line of a defence raised diminished by the *face* of the balloon.

FACE, external, *Facies externa*, in *Ichthyology*, is used to express a general form or figure in certain fishes, by means of which they agree with some and disagree with others; and according to which likeness or dissimilitude some authors of the late ages have arranged them into genera. This general figure in fishes consists in the shape of the head and body, and the shape, size, and proportion of the fins and tail, and though very obvious, is very indistinct; it being in many cases, where two fishes have the same general external *face*, yet hard to say, on a close examination, in what it is that the likeness consists. The authors who founded the distinction of the genera of fishes on these external resemblances ran into very great errors; for it is not enough in a general distinction for the character to be obvious, but it must also be precise and determinate. What this *face* had in the first of these requisites is often wanted in the last; and in general, it has been found to be no true basis of distinction. Many fish have the *facies externa*, or general appearance so much alike, as to be easily coupled at sight into the same genus; and that justly, as they really belong to the same when more precisely referred to it, according to their natural and more essential character. Of this kind are the pike, the eel, the salmon, the *perca*, the *carpio*, the *cyprinus*, the *trutta*, and many of the *cyprin*. In these the *facies externa* is of real use, as it is an obvious mark, and leads to the road of truth; but there are beside these many other fishes, which, though they are truly of the same genus, yet differ extremely in their several external appearances, so that any method founded on the *facies externa* must separate them, though nature had really joined them in their real characters. The tench and the *trutta lacustris*, or lake-trout, are in regard to their *facies externa* extremely alike one to the other; yet here this obvious character deceives us; for the tench is a species of the *cyprinus*, and the other a true and genuine salmon, two genera of fishes essentially and very widely different, though this method of judging by the external appearance would have coupled together fish belonging to them both. In the same manner the *carpio* and *trutta* are very like one to the other in their external appearance; but when nicely examined, according to the rules of ichthyology, they are found to belong to two very different genera, and to have very little real likeness. From these, and numerous other examples of a like kind, it evidently appears, that as the *facies externa* cannot be depended on for establishing the genera of fishes, some more essential characters must be enquired after for the regular and natural completion of this necessary business. Therefore, the general characters of fish are to be sought after in their external and invariable parts, and they are to be arranged into families and genera, according to the agreement of these in number, situation, figure, and proportion. Among all these, the characters taken from the number of the parts, where that is certain and invariable, are most valuable, as they most readily offer themselves to the eye, and are least of all liable to error.

FACE, in the *Monage*. See CHANFRIN.

FACE, in the *Military Language*, a word of command; thus, *face to the right*, is to turn upon the left heel a quarter round to the right; *face to the left*, is to turn upon the right heel a quarter round to the left.

FACE, among *Painters and Artists*, is used to denote a certain dimension of the human body, adopted for determining the proportion which the several parts should bear to one another; for this purpose they commonly divide the height of the body into ten equal parts, called *faces*; because the human *face* is the first model of these measures. Though the Apollo and Venus of Medici have more than ten *faces*. They again subdivide each of these *faces* into three equal parts; and this subdivision is founded on the consideration, that the *face* is made to contain three equal parts; e.g. the first commencing above the forehead at the root of the hair, and ending at the root of the nose, the nose forming the second part, and the third part ending just below the chin. See PANTOMIMION.

FACET, or *Facette*, a little face or side of a body, cut into a great number of angles.

Multiplying-glasses are cut in *facets*, or *facet-wis*. Diamonds are also cut in *facets* or tables.

In brilliants there are two sorts, *facet*, or *facet-wis*, and *facet-wis*. *Facet-wis* are divided into upper and under. Upper *facet-wis* are wrought on the lower part of the bezel, and terminate in the girdle.

Under *facet-wis* are wrought on the pavilion, and terminate in the girdle.

Star-facets are wrought on the upper part of the bezel, and terminate in the table. Jettons on Diamonds. See DIAMONDS.

FACETANUS *Lucerna*, in *Zoology*, the name of a peculiar species of lizard, called at Rome and Naples the *TARANTULA*.

FACIA, in *Architecture*. See FACIA.

FACIES *Hippocratica*, in *Medicine*, is when the nostrils are sharp, the eyes hollow, the temples low, the tip of the ears contracted and cold, the forehead dry and wrinkled, and the complexion pale or livid.

The *facies Hippocratica* is observed towards the period of phthisis and other fatal diseases, and is held a sure prognostic of death. It is observed within three days after the attack of the disease, and is deemed to indicate death.

FACK, in a *Ship*. See FACK.

FACTION, a cabal or party formed in a state to disturb the public repose.

The most celebrated *factious* are that of the Guelphs and Ghiblins, who kept Italy in alarm for many ages; and with us that of the Whigs and Tories.

FACTION was originally an appellation given to the diverse troops or companies of combatants in the games of the circus.

Of these there were four, viz. the *green faction*, the *blue faction*, the *red faction*, and the *white faction*. The Emperor Domitian is said to have added two others, viz. the *purple* and the *yellow*.

These *factious*, with their liveries and badges, were at length abolished; the emulation which was at first between them growing to such a height, that in Justinian's time 40,000 men were killed in a contest between the *green* and *blue factious*.

FACITIOUS, signifies any thing made by art, in opposition to what is the produce of nature.

De FACTO. See the article *De facto*.

FACTOR, in *Commerce*, an agent or person who sells and negotiates for a merchant by commission; called also commissioner, and on some occasion broker, and throughout the Levant, *coquis*.

Factors are either charged with the buying or the selling of goods, or with both.

Those of the first kind are usually established in places of considerable manufactures, or cities of great trade. Their office is to buy up commodities for merchants residing elsewhere; to see them packed, and send them to the persons for whom they were bought.

Factories of sale are usually fixed in places where there is a great vent. To these, merchants and manufacturers send their goods to be sold for them according to the price and other conditions expressed in the orders delivered them.

The wages or allowances for selling are usually clear of all expences of carriage, exchange, remittances, &c. excepting postage of letters, which are never put to account.

Factors should strictly observe the orders of their principals, or else they are liable to the damage accruing from the neglect of them. When *factories* have unlimited commission to do for their constituents the best they can, they are excusable, though their transactions are attended with loss to their principals; but no *fact*, who has merely a commission to sell, &c. for another, is excusable for carrying another person beyond the usual time allowed in the sale of the commodities which he disposes of: in such a case he is inferiour to the principal out of his own choice. If a *factor* sells or the usual

trust

trust to a person of good credit who afterwards becomes insolvent, he is discharged; but not if the man's credit was bad at the time of sale. A *factor* should always be punctual in the advice of his transactions, sales, purchases, freight, and draughts by exchange: he should never deviate from the orders he receives in the execution of a commission for purchasing goods, either with respect to price or quality: if goods that are bought are sent to a different place from that to which they were ordered, they become the *factor's* unless the merchant allows them. A *factor* that sells a commodity under the price ordered by his principal shall be obliged to make good the difference; and if he purchases goods for another at a limited price, and they rise in value, and he secures to himself the advantage, he is obliged to satisfy his principal for damages; or if he makes any advantage of the sale of goods which his principal directed him to purchase, the principal shall recover it from him, and he is liable to be answered for the fraud. When *factors* have obtained a profit for their principal, they must be cautious how they dispose of it; for if they act without commission they are responsible; and if a merchant remits goods to his *factor*, and about a month after draws a bill on him, and the *factor* having effects in his hands, accepts the bill, but the principal breaks, and the goods are seized in the *factor's* hands on behalf of the creditors, it has been judged that the *factor* must answer the bill, and come in as a creditor for so much as he was obliged by reason of his acceptance to pay. If one employs a *factor*, and intrusts him with the disposal of merchandise, and the *factor* receives the money, and dies, indebted to debts of higher nature, and it appears by evidence that this money was vested in other goods, and remains unpaid, those goods shall be taken as part of the merchant's, and not of the *factor's* estate; but if the *factor* has the money, it shall be considered as the *factor's* estate, and must first answer the debts of superior creditors, &c. If a person employs a *factor* to sell goods, who sells them on credit, and before the money is paid dies indebted, nevertheless his estate will pay, this money shall be paid to the principal merchant, and not to the *factor's* administrator, deducting his commission. A *factor* who has money in hand belonging to his principal, and who neglects to insure a ship and goods according to order, shall make good the damage if the ship miscarries; and if he make any composition with the insurers after insurance without orders, he is answerable for the whole insurance. As fidelity and diligence are required from the *factor*, so the law requires the like from the principal: if, therefore, a merchant remits counterfeit jewels to his *factor*, who sells them as true ones, and sustains loss or damage by imprisonment or other punishment, the principal shall not make satisfaction to the *factor* but to the party who purchased them. Business of this kind is called commission-business; and traders in this way have current as well as commission accounts constantly between them, and draw on, remit to, and send commissions to each other only by the intercourse of letters, which, among men of honour, are an obligatory and authoritative as all the bonds and ties of law.

FACTORS, in *Arithmetic*, is a name given to the two numbers which are multiplied one into another; that is, the multiplicand and multiplier, so called because they are to *facere productum*, make or constitute the product.

FACTORAGE. The *factorage*, or wages, called also commission, is different at different places, and for different voyages; at a medium it may be fixed at about three per cent. of the value of the goods bought, beside the charge of package, which is paid over and above.

At Virginia, Barbadoes, and Jamaica, the *factorage* is about eight per cent. and the like throughout the greatest part of the West Indies. In Italy it is two and a half; in Holland one and a half; in Spain, Portugal, France, &c. it is two per cent.

FACTORY, a place where a considerable number of factors reside, to negotiate and officiate for their masters or principals.

The term is chiefly used in speaking of the East Indies, and other parts of Asia, Turkey, Italy, Portugal, &c. whither the European nations send their ships every year, and where they keep factors to buy the commodities of the country, and sell those brought from Europe.

FACTUM, in *Arithmetic*, the product of two quantities multiplied by each other.

FACULE, in *Astronomy*, a name given by Scheiner, and others after him, to certain spots on the sun's disk that appear brighter and more lucid than the rest of the body.

The word is pure Latin, being a diminutive of *facies*, which, and supposed to be here applied from their appearing and disappearing by turns.

Vol. II. N° 124.

The *facule* or bright spots differ very considerably from the *macule* or dark spots, both in light, colour, figure, magnitude, and duration.

Hævelius assures us, that July the 20th, 1674, he observed a *facula* that took up a third part of the sun's diameter, and from the observations of the same Hævelius we learn, that the *macule* frequently change into *facule*; but the *facule* into *macule* rarely, if ever. Some authors even contend that all the *macule* degenerate into *facule* before they quite disappear.

Huygens, however, declines to be never able to discover any *facule*, though the *macule* occurred to him very frequently. All the foundation he could find for the notion of *facule*, he says, was, that in the Turkish clouds which frequently surround the *macule*, one sometimes discerns little points of spots brighter than the rest.

Many authors after Kircher and Scheiner have generally represented the sun's body full of bright, fiery spots, which they conceive to be a sort of volcanoes in the body of the sun; but Huygens, and others of the latest and best observers, finding, that the best telescopes discover nothing of the matter, agree to explode the phenomena of *facule*. Their cause these authors attribute to the tremulous agitation of the vapours near our earth; the same as sometimes shews a little unevenness in the circumference of the sun's disk when viewed through a telescope. Surely, then, the *facule* are not eruptions of fire and flame, but refractions of the sun's rays in the rarer exhalations, which, being condensed in the neighbourhood of that shade, seem to exhibit a light greater than that of the sun. See *SPOTS*.

FACULTY, a power or ability of performing an action.

The term is much used by the ancient philosophers, and still retained in the schools for explaining the actions of natural bodies.

Thus, to account for the act of digestion, they suppose a digestive faculty in the stomach; to account for motion, they imagine a motive faculty in the nerves, &c. which is only a substituting of one name of an unknown phenomenon for another.

Yet this practice of attributing effects to their respective virtues or faculties still obtains in divers things, which our philosophy has not yet afforded us a better account of. Thus, say our medicinal writers, fenna and rhubarb have a purgative faculty, barberries a cooling faculty, &c. which amounts just to this, that fenna purges, and barberries cools.

The *FACULTIES* or powers of the soul are commonly reputed two, viz. the understanding and will.

The *FACULTIES* of the body are usually distinguished with regard to their several functions, into vegetative and animal.

Under the vegetative faculty are comprehended the divers *sobolera* ones, whereby nutrition and generation are effected.

Under the animal faculties are comprehended those relating to sense and motion.

The vegetative faculty is subdivided into nutritive and generative, and the nutritive is again subdivided into natural and vital.

To the first belong the functions of the lower belly, relating to the preparation of the food; to the latter, the actions of the heart and lungs, wherein life is chiefly concerned.

Others subdivide the vegetative faculty into nutritive, retentive, excretive, and expulsive.

The animal faculties being those whereby an animal perceives and moves, become divided into sensitive and insensitive.

FACULTY is also applied in the Schools, to the divers parts or members of an university, divided according to the arts or sciences taught or professed there.

There are four faculties in most universities; that of arts, which includes the humanities and philosophy, and is much the most ancient and extensive; the second is that of theology; the third, medicine; and the fourth, jurisprudence, or laws. See each under its proper article.

The degrees in the several faculties in the universities are those of Bachelor, Master, and Doctor.

The *FACULTY* is frequently used absolutely, and by way eminence, for that chiefly studied and taught in that place.

Thus, the Faculty of London and Montpellier is medicine; that of Paris, theology; that of Orleans, law, &c.

FACULTY, in Law, denotes a privilege or special power, granted to a man by favour, indulgence, and dispensation, to do that which regularly by law he cannot; as to eat flesh upon days prohibited, or to marry without bans full asked, &c.

FACULTIES, the Court of. See COURT of Faculties.

FACULTY of Advocates, in Scotland. See ADVOCATE.

FÆCES, or *FÆCES*, the dregs, sediment, or impurities remaining

remaining of a mixt body, after the parts, more volatile, and fluid, have been separated from it by evaporation, distillation, decantation, distillation, or the like.

Thus we say the *faeces* of wine, of oil, &c. Those of wines are properly called *læta*; those of oil, *auræ*; those of small liquors, *grana*.

FÆCES, in *Chemistry* denotes, the lees, refuse, dirt, mud, impurities, and heterogeneous matters, remaining in the alembic after the distillation of any body: what remains in the retort, instead of *faeces*, is properly denominated *caput mortuum*, or *terre demanda*.

FÆCES is particularly used in *Medicine*, &c. for the gross, impure matters found at the bottom of the compositions and preparations of other pharmacy.

FÆCES is also used for the EXCREMENTS of an animal voided by stool.

The *faecal* matter is become famous for a chemical operation thereon, by M. Homberg, related at length in the *Mém. de l'Acad. R.* an. 1711. He had a notion suggested to him, that the *bonne faeces* by distillation yielded an oil clear as water, without any smell, and which had the property of fixing mercury into fine silver. Upon this, because he would have as luscious and promising a matter as he could, he hired four robust healthy young fellows, whom he fasted up for three months, and accords with them, that they should eat nothing but the finest bread, which he supplied them fresh every day, and drink the best Champagne wine as long as they could. After a long process, and numerous essays on the excrements they made, he at length got the clear, insidious oil; but it had no effect at all on mercury, which was the great point aimed at. As the method of working on this disagreeable matter, however, at length furnished him with a very fine phosphorus, it may be worth the attention of the curious.

FÆCULA. See **PECULLA**.

FÆSTING Mtn. See **FASTENMARE**.

FÆTOR. See **FOETOR**.

FÆX Vitæ, in *Chemistry*, a name given by Rulandus and some other of the writers, to the common nitre of saltpetre, and by others to potash.

FÆPINTO, a *faigned F.* in the *Italian Musc.* is what we commonly call the **FLAT** of any note.

FAG, is used for a knot or circumscription in cloth. *Stat. 4 Ed. IV. cap. 1.*

FAG END, in the *Seafaring*, denotes the end of any rope or cord which is become unswelled and loosened by frequent use; to prevent which, the ends of ropes are generally well stiffened by winding a piece of small line or peck-thread around them, which operation is called whipping.

FAGARA, in *Botany*, a genus of the *tetrandria monogynia* class. The calyx is cut into four segments; the corolla has four petals; and the capsule is bivalve, and contains a single seed. There are four species.

FAGARA, in the *Materia Medica*, the name of a fruit resembling the cubeb found in the Philippine islands. The part of this fruit which contains the principal virtue is the outer rind; this is tender and blackish, and of an aromatic and somewhat acid taste. When the berries are ripe they easily break, and disclose a black, shining, solid kernel, void of taste and smell. The berries, according to Avicenna, are heating and drying, and good for a cold weak stomach, to help digestion, and are assuaging to the bowels. They were once much used, but of late are scarce known in the shops.

FAGGOT, in *Agricultr.* There is a thing, worth observing to the owners of the woods in the article of the making up the underwood into *faggots*. The workmen, when they have bound up the *faggots*, trim off the superfluous branches from the sides and end to make it more neat, and then they add to the middle of the next; but they are of little or no advantage there, and ought to be left on the ground; for being small, they would soon rot there, and would manure the ground so as to be of more advantage to the next growth than is easily imagined. The leaves of the trees falling to the earth, manure it very much; but this is nothing to the advantage of those little pieces of wood; any rotten wood, but in a moderate quantity, will turn a common bad earth into good garden mould; and the growth of the young trees is more forward by this manure where it is left than by any other means that can be used to it. We always see the land where wood-roads have been enriched to a surprising degree by them; and the same advantage will be wherever wood of any kind is left to moulder and rot upon the ground.

FAGGOT, or **FAGOT**, in *Fertilization*. See **FASCING**.

FAGGOTS for *fuel* are required by 43 *Eliz. cap. 12.* to contain in compass, besides the knot of the bond, twenty-four inches of allice; and every *faggot* must within the

bond shall contain full three feet of allice, except only one stick, which is to be but one foot long, to stop or harden the binding.

FAGGOT of *flax*, expresses the quantity of 120 lb. weight. **FAGGOT**, in the times of Popery in the kingdom, was a badge worn on the sleeve of the upper garment by such as had abjured heresy, being put on after the person had carried a *faggot*, by way of penance, to some appointed place of solemnity. The leaving off this badge was sometimes interpreted a sign of apostasy.

FAGGOTS, among the *Military Men*, are ineffective persons who receive no regular pay, nor do any regular duty, but are hired occasionally to appear at a muster, to fill up the companies, while the real deficiencies thereof, and cheat the king of so much pay, which goes into the officer's pocket.

FAGONA, in *Anatomy*, a conglomerate gland, called also **THYMUS**.

FAGONIA, in *Botany*, a genus of the *dianthia monogynia* class. Its characters are these: the flower hath five heart-shaped petals which spread open, and are narrow at their base where they are inserted in the emulument, and have erect stamens. In the centre is situated a five-angled germ, which afterwards becomes a roundish capsule, having five lobes ending in a point, and five teeth, each having a single toothed seed. There are three species. *Musc. Gard. Dich.*

FAGOPYRUM. See **BAUTHERAT**.

FAGOTTINO, in the *Italian Musc.* the name used for the single curial, which is a musical instrument somewhat like the bassoon.

FAGOTTO, in the *Italian Musc.* the name of the double curial, being as big again as the *fagottino*, and in reality the same with a *basoon*.

FAGUS, in *Botany*. See **QUERCUS**.

FAGUTAL, in *Mythology*, a temple of Jupiter, so called from *fagus*, the *beech*, a tree sacred to Jupiter; because, as some say, the temple was erected in the neighbourhood of a forest of *beech* trees. Others say that that part of mount *Equus* which was formerly called *Monte Apia* was afterwards called *Monte Fagus*; and that Jupiter *Fagutalis* was the same with Jupiter *Fagutalis*.

FAHNLEEN, *Fahnen*, in *Germany*, among the Germans, a kind of greater livery which the emperor alone could confer.

This was done by the delivery of a standard, whence they had the name of *fahnen*; i. e. *standards*. We find them mentioned in the golden bull of the emperor Charles IV. ann. 1356: *Fahnen principum exceptis, et illis que vassalibus vulgariter stipulantur, quorum investituram et cellatorem fili imperatoris, vel regis Romane specialiter referuntur*. Du-Gange Gloss. l. 1. in voc.

The word is more usually written *fahnen*.

FAIDA, in our *Old Writers*, is used for malice or deadly feud. *Leg. Hen. I. cap. 83.*

FAILLIS, in *Horology*, a French term, denoting some failure or flaw in an ordinary, as if it were broken, and a splinter taken from it.

FAILURE, or **FAILING**, a species of **BARRETRY**, particularly called breaking or stopping payment.

FAILURE of record, in *Law*, is used when an action is brought against a man who alleges in his plea matter of record in bar of the action, and endeavours to prove it by the record. The plaintiff replies, *nil per record*; that is, he denies there is any such record. Upon which the defendant has a day given him by the court to bring it in; and if he fails to do it, he is said to fail of his record; and the plaintiff shall have judgment to recover.

FAINT, or **FAINT-ACTION**, in *Law*, is as much as *faigned action*; that is, such an *ACTION* as, though the words of the writ be true, yet, for certain causes, the party has no title to recover thereby. By which it differs from *falsè actio*, which is that where the words of the writ are false.

Yet sometimes the two are confounded.

FAINT pleader, in *Law*, a fraudulent, false, or collusive manner of pleading, to the detriment of a third person. Against which, among other things, was made the *Statute* 1 *Edw. I. cap. 29.*

FAIN'S, in the *Distillery*, the weak spirituous liquor that runs from the still in rectifying the low wines after the proof-spirit is run off.

FAINTS is also the last runnings of all spirits distilled by the alembic. The clearing of the worm of these is so essential a point in order to the obtaining of a pure spirit by the succeeding distillation, that all others are *impurities* without it.

FAINTING. See **LIGNITHYMIA** and **SWOONING**.

Some people are extremely apt to *faint* during the operation of bleeding. In all cases, therefore, where plentiful bleeding is indicated, it is best to do it in bed, in order to prevent the patient's *fainting*. It is likewise

observed,

observed, that a person will bear the loss of a much greater quantity of blood, if the stream is small, than by a large orifice, which some think necessary for making a more speedy revulsion. Pringle, *Observ. on the Diseases of the Army*, p. 137.

FAIR, a public place, where merchants, traders, and other persons from distant parts, meet, on some fixed day in the year, to buy and sell commodities, and to partake of the diversions usually accompanying such assemblies: or it denotes the concourse of people assembled on such occasions. See **MARKET**.

The word *fair* is formed of the French *foire*, which signifies the same thing; and *foire*, some derive from the Latin *forum*, market; others from the Latin *feria*, because *foires* were anciently always held in the places where the wakes, or feasts, of the dedication of churches, called *feriae*, were also held. The Romans called them *mundicia*. Eric Poteanus has a pretty little treatise on the *foires* of the Romans, De *Nundinis Romanorum*, which he calls *nova fassorum fœcula*.

Fairs can only be established by virtue of the king's grant, or by long and immemorial usage and prescription, which supposes such a grant: he is also the sole judge where *fairs* and markets ought to be kept; and if any person set up a *fair*, without the king's authority, a *que warrant* lies against him; and the persons who frequent such *fairs*, &c. may be punished by fine to the king. Every *fair* is subject to the regulation of the *coverts* of *perpetuity*. The duration of *fairs* is determined by proclamation; and if a person shall sell any goods after the time of the *fair* expires, he shall incur a forfeiture of double the value of the goods sold, one fourth to the procurator, and the rest to the king. 5 Ed. III. cap. 5. Any citizen of London may carry his goods to any *fair* or market in England at his pleasure. If any person is intitled to hold a *fair* or market, and another is set up within the distance of a third part of twenty miles, either on the same day, or a different day, it is a nuisance, and an action on the case lies; and also against persons disturbing such, as are coming to buy or sell at the *fair* or market, so that the person holding his *fair*, &c. loses his *toll*, or receives prejudice in the profits arising from it.

Fairs abroad are either free, or charged with tolls and impositions. The privileges of free *fairs* consist chiefly, 1. In that all traders, &c. whether natives or foreigners, are allowed to enter the place, and are under the royal safeguard and protection in coming and returning, they and their agents, with their goods, &c. 2. In that the said persons, and their effects, are exempt from all duties, impositions, tolls, and servitudes. 3. That merchants, in going to, or returning from the *fair*, &c. cannot be arrested, or their goods stopped, &c. It is the sovereign alone that has a right, by his letters patent, to establish *fairs*, whether free, or subject to duties, and the other ordinary laws and penalties.

Several *fairs* are held in the open fields, or on heaths and commons, under tents, booths, and barracks, erected for the purpose; as *Stourbridge fair*, &c. others in places walled in for the purpose, and formed into regular streets, lanes, &c. for the occasion: as the *fair* of St. Laurence at Paris. Lastly, others are held in the open places and streets of cities; as *Drill fair*, the *fair* of St. Germain, &c.

Fairs, particularly free *fairs*, make a very considerable article in the commerce of Europe, especially that of the Mediterranean or inland parts; as Germany, &c. when the continual passage and repassage of vessels are impracticable.

The most celebrated *fairs* in Europe are those, 1. of Francfort, held twice a year, in spring and autumn, the first commencing the Sunday before Palm-Sunday, and the other in September. Each is declared by sound of bell, and lasts three weeks; the first of which is called the week of acceptance, and the second the week of payment, though many bills of exchange are now payable in the third week, but this must be mentioned, because every bill payable in the *fair* is, without such a clause, deemed payable in the second week. They are famous for the sale of all kinds of commodities, but particularly an immense quantity of curious books, no where else to be found; and from whence the book-sellers, throughout all Europe, used to furnish themselves. Before each *fair*, there is a catalogue of all the books to be sold at it, printed and dispersed, to call together purchasers; though the learned have generally complained of divers unfair practices therein; as fictitious titles, names of books purely imaginary, &c. beside great faults in the names of the authors, and the titles of the real books. 2. The *fairs* of Leipzig, which are held thrice a year; one beginning on the first of January, another three weeks after Easter, and a third after Michaelmas; they last twelve days each, and are, at least, as considerable as

those of Francfort. 3. The *fairs* of Novi, a little river in the Milanese, under the dominion of the republic of Genoa. There are four of these in the year; commencing on the first of February, the second of May, the first of August, and second of November. Though the commodities bought and sold here, be very considerable, yet what chiefly contributes to render them so famous, is the vast concourse of the most considerable merchants and negociants of the neighbouring kingdoms, for transacting affairs, and settling accounts in matters of bank and exchange. Each of these usually lasts eight days. 4. The *fairs* of Riga, whereof there are two in the year; one in May, and the other in September. They are much frequented by the English, Dutch, and French ships; as also by others from all parts of the Baltic. The best time for the sale of goods at Riga, is during the *fairs*. Since the building of the famous city of Petersburgh, these *fairs* have suffered some diminution. 5. The *fair* of Archangel; during which, all the trade foreigners have with that city is managed. It continues a month, or six weeks, at most; commencing from the middle of August. The Muscovite merchants attend here, from all parts of that vast empire; and the English, Dutch, French, Swedish, Danish, and other ships in the port of that city, on this occasion, ordinarily amount to three hundred. But this is no free *fair*, as the rest are; the duties of exportation and importation are very highly paid, and on a very high footing. 6. The *fair* of St. Germain, one of the suburbs of Paris, commencing on the third of February, and holding till Easter; though it is only free for the first fifteen days. It is frequented by traders with various sorts of cloths and stuffs, and the goldsmiths, jewellers, and toy-men of Paris, have well furnished and handsome shops in it. 7. The *fairs* of Lyons, which Most Du Chêne, in his *Amiquité* of Cluses, would intimate from a passage in Strabo, were established by the Romans, though it is certain, the *fairs*, as they now stand, are of a much later date. There are four in the year, each lasting twenty days, and free for ever. They begin on the first Monday after Low Sunday, the fourth of August, the third of November, and the first Monday after Easter. 8. *Fair* of Cahors, a suburb of the city of Valaise, in the Lower Normandy. It is said to have been established by our William the Conqueror, in consideration of his being born at Falaise. It commences on the fifteenth of August, and lasts fifteen days; free by charter, and longer by custom. 9. *Fair* of Beaucaire, held partly in a city of that name, in Languedoc, and partly in the open country, anciently, &c. It commences on the twenty-second of July, and only continues for three days; yet it is the greatest, and most celebrated, of all the *fairs* in that part of Europe, both for the concourse of traders from all parts of the world, and for the traffic of all kinds of goods: the money returned, in these three days, amounting sometimes to above six millions of livres. Besides these, there are in France several other *fairs* of considerable note; as the four *fairs* of Rheims, the two of Rouen, two of Bourdeaux, two of Troyes, two of St. Dennis, that of Cam, of Dieppe, and of Toulon, &c.

The *fairs* of Porto-Bello, Vera-Cruz, and the Havannah, are the most considerable of all those in the Spanish West India. The two first last as long as the fleets and galleons continue in those parts; and the last is opened as soon as the fleets, or galleons, arrive there, upon their return for Spain; this being the place where the two fleets join.

The principal *fairs* in Great Britain are, *Stourbridge fair*, near Cambridge; the two *fairs* of Bristol, that of Exeter, West Chester, Edinburgh, Weyhill, and *Barford fair*, for sheep; *Panels fair*, in Staffordshire, for saddle-boxes; *Barnet fair*, near London, for lean and Welsh black cattle; *St. Faith's*, in Norfolk, for Scots runts; *Yarmouth fishing fair* for herrings; *Ipwich butter fair*, that of Woodborough Hill, near Blunsdon in Dorsetshire, famous for well-country manufactures, *Devonshire kerseys*, *Wiltshire druggens*, &c. two cheese *fairs* at Atherton and Chipping Norton; besides many more *fairs* and weekly markets in different parts of the kingdom.

FAIR, in Sea Language, is used for the disposition of the wind, when it is favourable to a ship's course, in opposition to that which is contrary and foul. The term *fair* is more comprehensive than large, and includes about sixteen or eighteen points of the compass; whereas large is confined to the beam or quarter, that is, to a wind which crosses the keel at right angles, or obliquely from the stern, but never to one right or stern. Falconer's *Marine Dict.*

FAIR CURVE is a winding line, used in delineating ships, whose shape is varied, according to the part of the ship which it is intended to describe.

FAIR-PLAYING, in Law. See *BEAU-PLAID*.

FAIRWAY, in *Sea Language*, the path or channel of a narrow bay, river, or haven, in which ships usually advance in their passage up and down: so that if any vessels are anchored therein, they are said to lie in the *fair-way*. *Falconer*.

FAIRY, a term frequently occurring in ancient traditions and romances, denoting a kind of genii, or imaginary deities, sometimes on earth, and distinguished by abundance of fantastical actions and offices, either good, or evil.

The *fairies*, according to these traditions, are a peculiar species of divinity, that have but little relation to any of those of the ancient Greeks and Romans; unless, perhaps, to the *laræ*: though others will not have them ranked among deities, but suppose them an intermediate kind of beings, neither gods, nor angels, nor men, nor devils.

They are of oriental extraction, and seem to have been invented by the Persians and Arabs, whose history and religion abound with tales of *fairies* and dragons. The Persians call them *Peti*, and the Arabs *Ginn*; having a peculiar country, which they suppose them to inhabit, called *Ginnistan*; and, by us, *Fairy Land*. Our famous countryman Spenser's master-work, the *Fairy Queen*, is an epic poem under the persons and characters of *fairies*.

FAIRY CIRCLE, or ring, is a phenomenon pretty frequent in the fields, &c. being a kind of round, supposed, by the vulgar, to be traced by the *fairies* in their dances.

There are two kinds: one of them seven or eight yards in diameter, containing a round bare path, a foot broad, with green grass in the middle; the others of diverse sizes, being encompassed with a circumference of grass, much thicker and greener than in the middle.

Mr. Jussap, and Mr. Walker, in the Philosophical Transactions, ascribe them to the lightning; which is confirmed, by their being most frequently produced after storms of that kind; as well as by the colour and brightness of the grass-roots, when first observed. It is no wonder that lightning, like all other fires, moves round, and burns more in the extremity than in the middle. According to these gentlemen, the second kind of circle arises originally from the first; the grass burnt up by the lightning serving to grow the more plentifully afterwards, *Phil. Trans. ser. vol. ii. p. 484*.

It is not improbable that these *fairies rings* may be of the same kind with those *CIRCULAR SPIES* produced on the surface of metal by large electrical explosions. The chief objection against this hypothesis is, that in these rings there is no appearance of any thing corresponding to the central spot in such electrical impressions; and that they have no regular concentric circles, nor an invariable circular figure. Mr. Walker, however, found one of these rings immediately after a thunder storm, which he could ascribe to no other cause but the lightning. *Ubi supra*. Other authors have asserted, that these *fairies rings* are formed by ants; because those insects are sometimes found travelling in troops therein; and others, that they are both of mull-worms.

FAIT, *Faitum*, in *Law*, is used for a writing lawfully executed to bind the parties thereto. See *DEED*.

FAITH, *Fides*, in *Antiquity*, is denoting honesty or fidelity, was deified by the Romans, and represented with an erect open air, and dressed in a thin robe, so fine, that one might see through it. This deity is also represented as very old and grey-headed; and she appears on medals as giving her hand, and sometimes only by two hands joined together.

FAITH, in *Philosophy and Theology*, that assent which we give to a proposition advanced by another, the truth of which we do not immediately perceive from our own reason or experience; or it is a judgment, or assent of the mind, the motive whereof is not any intrinsic evidence, but the authority, or testimony, of some other, who reveals or relates it.

Hence, as there are two kinds of authorities and testimonies, the one of God, and the other of man, *faith* becomes distinguished into *divine* and *human*.

FAITH, *divine*, is that founded on the authority of God; or it is that assent we give to what is revealed by God. The objects of this *faith*, therefore, are matters of REVELATION.

FAITH, *human*, is that whereby we believe what is told us by men.

The object hereof is matter of human testimony and EVIDENCE.

Faith, again, may be distinguished into *implicit*, and *scientific*.

FAITH, *implicit*, or *blind*, is that whereby we give our assent to a proposition advanced by another, of whose knowledge and veracity we have no certain and evident reason or proof. This is only opinion, under another name.

FAITH, *scientific*, or *seeing*, is that by which we give our assent to a proposition advanced by one who can neither deceive, nor be deceived; which may be properly referred to science and Evidence.

Divine faith, *scientia divina*, is stronger than human. When we strictly consider, that any proposition comes from God, *faith* becomes assurance, or science; it being an inflexible in our idea of God, that he can neither deceive, nor be deceived; but when there is any doubt, whether the proposition is dictated by God, the *faith* can be no stronger, or weaker, than the reasons on which it is founded; *divine faith*, therefore, may either be strong, weak, or none at all. Again the reasons or motives of believing men, may be of such weight and force, that being perfectly understood, they may equal a mathematical evidence; and then the human *faith* is scarce inferior to the divine; there being, as it were, an equal necessity of giving our assent on each side.

Hence it is easily observed, that all our *faith* or belief has its foundation on reason, which cannot deceive us, if we make a due use of our liberty, and do not acquiesce, till that necessarily compels us.

All our present religious *faith* is really human, as depending on the secondary testimony of men; of whose veracity, however, we have the strongest proofs. The prophets, or those to whom God immediately revealed his will, believed him because they knew he could not deceive. We, at this day, believe them, or rather their writings, for other reasons; viz. the fame which obliges us to believe all well-attested histories. See *EVANGELISM*. Besides the two species of *faith*, human and divine, the Romanists make a third, or intermediate kind, called

FAITH, *ecclesiastical*, which is the assent orthodox persons give to certain events decided by the church, and enjoined to be believed by all.

As, when the church declares, that such a book contains heretical doctrine, &c.

This term, *ecclesiastical faith*, was first introduced by M. Pererius, to distinguish the faith whereby we believe matters of divine revelation, from that whereby we believe matters of ecclesiastical tradition.

FAITH, in *Practical Theology*, means the trial of the theological virtues, or graces.

Faith in God, in this sense, denotes such a conviction of his being, perfections, character, and government, as produces love, trust, worship, obedience, and resignation. *Faith* in Christ, as it has been defined by some, is a mere assent to the Gospel as true; according to others, it signifies such a persuasion that he is the Messiah, and such a desire and expectation of the blessings which he has promised in his Gospel to his sincere disciples, as engage the mind to fix its dependence upon him, and subject itself to him in all the ways of holy obedience; and thus defined it is a very extensive principle, and includes in its nature and inseparable effects the whole of moral virtue. In this sense it has been said, that under the Gospel a man is justified by *faith*. *Faith*, likewise, in respect to futurity, is a moral principle, implying such a conviction of the reality and importance of a future state, as is sufficient to regulate the temper and conduct.

FAITH, *injection of*. See *CONFESSION*.

FAITH and *honor*, in the *Poetical Law*. See *FEALTY*.

FAITHFUL, an appellation which the Mahometans assume to themselves. See *MUSULMAN*.

FAITHFULNESS, in *Ethics*, is an agreement between a man's promises and his actions.

FAITHFUL, in *Natural History*, the name of a species of shell-fish called by many authors, by a much less determinate name, *unio imbricatus*. The French have thus called it, from the word *fausse*, which, in the same language, signifies the *roof of a house*. The shell is of the bivalvular, or two-leafed kind, and has seven longitudinal ribs, and a great many laminae running transversely across them, so that it greatly resembles the roof of a house, where the rafters and cross-beams are seen while it is not covered with tiles.

FAITOURS is used in stat. 7 Ric. II. cap. 5. for evil doers; and may be interpreted idle livers, from (says the author of the *Termes de Ley*) *faiteur*, which signifies a kind of sleepy disease, proceeding from too much sluggishness. In the former allusion it seems synonymous with vagabond.

FAKE, or *FACE*, in the *Sea Language*, one round or circle of a cable; otherwise called a coil.

FAKIR, or *FAQUIER*, a kind of dervise, or Mahometan religious, who travels the country, and lives on alms.

The word *fakir* is Arabic, and signifies a poor or needy person. It is formed of the word *فقر*, *fakara*, *he is poor*.

D'Hérbelot makes *fakir* and *dervise* the same thing. The Turks and Persians use the name *dervise* for any poor person, whether he be in out of necessity or choice; and the Arabs apply *fakir* in the same sense. Whence, in some

some Mahometan countries, the religious are called *derwishes*, and in others, particularly throughout the states of the great Mogul, *fakirs*.

The *fakirs* sometimes travel singly, and sometimes in company. When they go in companies, they have a superior, who is distinguished by his habit. Each *fakir* bears a horn, which he blows at his arrival in any place, as also at his departure; and a kind of scraper or trowel, to scrape the earth in the place where he sits, or lies down. When they go together, they divide their alms equally amongst them; give what is left every night to the poor; and never receive any thing for the narrow.

There is also a kind of idolatrous *fakir*, who follow much the same practice. D'Herbelot reckons in the Indies eight hundred thousand Mahometan *fakirs*, and twelve hundred thousand idolatrous ones; to say nothing of several extraordinary species of *fakirs*, particularly penitents, whose mortification and penance consist in very odd observances. Some, e. g. remain night and day, for many years, in certain uneasy postures. Others never sit or lie down to sleep, but sustain themselves by a rope, hung down for that purpose. Others bury themselves in a ditch, or pit, for nine or ten days, without eating or drinking. Others keep their arms lifted up to heaven, so long, till they cannot let them down again if they would. Others lay fire on their heads, and burn the scalp to the very bone. Others roll themselves naked on thorns. Tavernier, &c.

Another class of *fakirs* retire into mosques. Live on alms and devote themselves to the study of the law, the reading of the Alcoran, &c. to fit themselves for mosques, or doctors. People of quality sometimes assume the character of *fakirs*. The famous Aurengzeb himself, before he ascended the throne, gave out, that he intended to commence *fakir*.

FALACA, a kind of ballinado inflicted on the Christian captives in Algiers. The *falaca* is properly a piece of wood, about five foot long, bored with two holes, through which the feet of the patient are put, who is laid on his back on the ground, with his arms tied. Two men are employed to give him fifty or a hundred strokes with a cudgel, or bull's pizzle, on the soles of his feet. A very trifling fault often incurs this severe punishment.

FALACER, in *Mythology*, the name of a Roman deity, recorded by Varro.

FALANG, in *Old Writers*, is used for a jacket or close coat. Bloom.

FALANGIE, in the *Matris Medicis*, a name given by some of the ancients to the ocyum or basil. The *falangie musk* is the sweet-scented basil. Some of the commentators on the works of Avicenna, have supposed, that the fruit called *fel*, was the seed or fruit of this plant; and that the word was only an abbreviation of *falangie*, but this is by no means right. See *FEL*.

FALCADE, in the *Manège*. A horse makes *falcaides*, when he throws himself upon his haunches two or three times, as in very quick curvets, which is done in forming a stop, and half-stop. A *falcaide*, therefore, is the action of the haunches, and of the legs, which bend very low, as in curvets, when you make a stop or half stop.

They say, this horse stops well, for he makes two or three *falcaides*, and finishes his stop with a pefate. This horse has no haunches, he will make no *falcaide*. The *falcaide* is so much the prettier, as in making them his haunches are low. Stop your horse upon the haunches, in making him fly them well, so that after forming his *falcaide*, he may refuse his gallop without making a pefate, that is, without stopping, or making one time. And thus he will make an half stop. See *HAUNCHES* and *TIME*.

FALCANOS, a name given by some of the chemical writers to arsenic.

FALCAITA, in our *Old Writers*, was used for the grass fresh mowed, and laid in sheaves.

FALCATELL, one of the phases of the planets, popularly called horned.

The astronomers say, the moon, or any planet, is *falcata*, when the concave part appears in form of a sickle, or crescent-hook, by the Latins called *falcis*.

The moon is *falcata* whilst she moves from the third quarter to the conjunction, and from the conjunction, or from new moon, to the first quarter; from hence to opposition, or full, and from full to the third quarter the enlightened part appears gibbous, and the dark *falcata*. See *MOON*.

FALCATON, in our *Old Writers*, the servile tenant who performed service of falcaure.

FALCAURE, *Falcaure*, in our *Old Writers*, signifies one day's mowing of grass; a customary service to the lord by his inferior tenants. Kennet's Gloss. in voc.

FALCINELLUS, in *Ornithology*, the name of a bird in fons for resembling the herons, but with a shorter beak. It is of a very beautiful colour, but with a fine glossy green

with an admixture of a purplish orange; the head and neck are brown, but the upper part of the throat whitish with black spots; its beak is like that of the curlew, very long, very slender, and crooked; its legs moderately long; as this bird grows older, it becomes a brownish hue. It is called by some, *ardus nigra*, the black heron, and by the Italians *acim nigra*. Ray's Ornithology, p. 218.

FALCON, *Falco*, in the Linnæan system of *Zoology*, makes a distinct genus of birds of the hawk-kind, the characters of which are, that they have a strong hooked bill, the base of which is covered with a cere, or naked skin; the head is covered with feathers, and the tongue is bifid. Linnæus classes no less than thirty-two species under this genus, among which are the eagle, the buzzard, the kestrel hawk, the lanner, the goshawk, &c.

Jo. de Janu, and several others, take the name *falco* to have been occasioned by its crooked talons, or pounces which resemble a *falcis*, or sickle. Giraldus derives it a *falanda*, because it flies in a curve.

The *falco* is a bird of prey of the hawk-kind, much esteemed for its strength and activity. There are many species of this bird; but when the word *falcis* is used singly, without any distinctive addition, it is meant of that species, called by authors the *falcis peregrina*, from its travelling into different countries, at different seasons of the year.

It has very long and large wings, reaching when folded to the tip of the tail. Its shoulders are very large, its tail very long, and ending like the sparrow-hawk's in a point, its end being white, variegated with orange coloured streaks. Its feet are of a greenish or bluish yellow, its neck is long, and its head and back of a pale dove colour. There is a variety of this bird, which is of a much blacker colour on the back, and has been erroneously esteemed by some a different species; probably it is only owing to the difference of age or sex. This bird is caught in France, Germany, and elsewhere; but it is not well known where it builds. It feeds on ducks, geese, and other large birds.

This species builds on the rocks of Lindisfarne, in Carnarvonshire, and is very common in the North of Scotland. Mr. Pennant mentions a surprising instance of the rapidity of their flight; one that was reclaimed by a gentleman of the shire of Angus, on the east side of Scotland, eloped from his master with two heavy bells to each foot, on the twenty-fourth of September, 1778, and was killed in the morning of the twenty-sixth, near Mollin in Flintshire. *Zoology*, vol. i. p. 129.

The *falco* is of the long-winged hawk-kind, used in the diversion of hawking. There are several species of *falco*. 1. The *falcis peregrina*, or common *falco*. 2. The *falcis*, called *falcis laur* by authors. 3. The *jerfaul* or *jerfaul*. 4. The *mountain-falco*. 5. The *gentle falcon* or *falcis gentilis*, suspected by Mr. Ray to be the same with the common or first kind. 6. The *biggared-falco*, remarkable for the shortness of its neck. 7. The *white falco*, all over of a pure snow-white. 8. The *blue-falco*, of a deep blackish blue. 9. The *Yamir* or *Barbaric falcon*, which resembles the common kind, but is smaller. 10. The *red falco*, much resembling the common kind, but spotted with a reddish colour; and the red and crested Indian *falco*, which seem to be the male and female of the same species. Ray's Ornithol. p. 40 to 48. See *GYRALFON*, *SACRE*, *LANNARIUS*, &c.

To these we may add the *spotted falcon*, about the size of a buzzard; with a black bill, yellow cere and legs, pale yellow irides; the crown and hind part of the neck white, spotted with light reddish brown; back and scapulars of the same colour, edged with white; the quill-feathers dusky, barred with ash colour; the underfeathers of the neck, breast, belly, and thighs, white, and very strong legs; and also the *rough-legged falcon*, a native of Denmark in length about two feet two inches, with a dusky bill, yellow cere; the head, neck, and breast, of a yellowish white, marked in some parts with oblong brown streaks; the belly of a deep brown; the thighs and legs of a pale yellow, marked with brown; the extreme half of the tail brown, tipped with dirty white; that next to the body white; the legs covered with feathers as low as the feet, and the feet yellow. Pennant's British Zoology, vol. ii. p. 190; and vol. ii. p. 613.

It must be added, that the name *falco* is restrained to the female; for as to the male, it is much smaller, weaker, and less courageous, than the female; and is denominated a *testis* or *trequin*.

The *gentle falcon*, with yellow legs, ash-coloured body spotted with brown, and four or five blackish bars on the tail, is the most valuable of all these, as being the most tame and manageable, and the most hardy, enduring all weathers without hurt. It makes its nest in rocks, and inhabits the North of Scotland. This kind of *falco* has a natural inclination to make the heron fly every way, and is

most excellent at the brook or river fowling, and especially at the larger birds, as at the *buried*, wild geese, and the like. If the be an *eyrie* he may be ventured at the *crane*, otherwise he will not be so lucky.

Hawks in general prove courageous or cowardly all their lives, as they are first quartered; and if they are taken out of the *eyrie* before they are fully fumed and well pounced, their wings will never grow to perfection. Their legs, also, will grow crooked, and their train will be full of joints. *Falcons* of one and the same kind are called by the sportsmen by very different names, and esteemed of several different kinds according to the place and time of their reclaiming, and the countries from whence they came. Thus the names *newed-hawk*, *ramaged-hawk*, *four-hawk*, and *eyrie*, first commenced; and these are again divided into large hawks, *swan-hawks*, and *beaver-hawks*. All these have different moods and plumes, according to the country from whence they come; some are by some brown; they have also each its different disposition, some being better for the field, and others for the brook or river. Different names are also given to *falcons*, according to their different age and time of taking. The *falcon* is called an *eyrie* as long as he remains in the *eyrie*; there are always troublesome in their footings, they cry very much, and they are not entered without great difficulty; but being once well entered, they prove excellent hawks for the hunt and all the large fowl, and are very hardy and full of courage. The second name given this bird is the *ramaged-falcon*. This name the retains from the time of her leaving the *eyrie*, during the months of June, July, and August. This is always hard to be managed; but being reclaimed, they are not inferior to any hawk. The third is the *four-hawk*, so called in September, October, and November. These birds keep for a whole twelvemonth the first feathers, which they have on when they leave the *eyrie*, and do not molt them. There are therefore called the *four-hawks*. The fourth is termed the *newed-hawk* or *crill*, *quæ* carry-fall, for they molt at this time. He almost continually carried on the fist. They are thus called from January to the middle of May. These are usually great *hunters*, and very little eaters; they are subject to several troublesome disorders, particularly to the *fluor*, more than any other hawk, and they are very seldom thought to be good for anything. The fifth name is the *crill*. They are called by this name from May till December, because all that time they are calling their *crills*. These would be excellent hawks if they could be trained; but they are untamed. They must be kept hard under, and the falconer must make his fist their perch. The hawk newly taken must be fed, have all new furniture, and must be often stroked with a stick to accustom her to be gentle. She must also have two good bells, that she may be well heard when she flies or scratches; and her beak and talons must be cut a little, but not so near as to make them bleed. If there be a *four-falcon* taken that has already crossed the sea, she is usually very hard to be broken; but that being well done, she is the best of all hawks. Her food must be good and warm, and it must be given her at least three times a day. It should be pigeons, larks, or other live birds; for she must be broke by degrees from her accustomed manner of feeding. The hawk must always be fed with hoop and lute, that she may always know when you will give her meat. She must then be gently unhooded, and two or three bits being given her, the hawk is hooded again; and in the night let her roost on a perch near some person's bed, that she may be often waked in the night. When by these means she becomes tame and gentle, her usual food may be changed, and a sheep's heart given her. After this she may be unhooded in the day-time, but not in company; and after giving her a bit or two, the hawk is hooded again, and then a little more given her. After this, by degrees, she will be taught to eat before company, and then the business of training her will be soon accomplished. Till she is thoroughly tamed, the hawk must be borne continually on the fist, and fed in company, giving her in the morning about six-furthe of the wing of a pullet, and every evening the foot of a hare or rabbit cut off above the joint, head and laid in water, which having squeezed give it her with the pinion of a hen's wing. It is best to give the hawk washed meat, and after this plumage, according as she seems to be foul within. She is then to be hooded, and nothing more should be given her till the gleams after calling, but when she has gleamed and call, she should then have some hot meat given her, toward evening especially, and be made to eat it in company. When she is well reclaimed, tamed, and sharp-set, she may be fed on the lure.

But three things are to be considered before your lure be showed her. 1. That she be bold and familiar in com-

pany, and not afraid of dogs and horses. 2. Sharp-set and hungry, having regard to the hour of morning and evening when you would lure her. 3. Clean within, and the lure well garnished with meat on both sides. When you intend to give her the length of a lead, you must abscond yourself; the hawk also be unhooded, and have a bit or two given her on the lure, as she sits on your fist. That done, take the lure from her, and so hide it that she may not see it; when she is unseized, call the lure to near her, that she may catch it within the length of her lead; and as soon as she has seized it, use your voice as falconers do, feeding her upon the lure on the ground.

After having lured your *falcon*, in the evening give her but little meat, and let this luring be so timely, that you may give her plumage, &c. next morning on your fist; when she has call and gleamed, give her a little breeding of warm meat about noon, the a creature to her leading go into the field, there give her a bit or two upon the lure, and unlead her. If you find she is sharp-set, and has eagerly seized on the lure, let a man hold her, to let her off to the lure; then unwind the creance, and draw it after you a good way, and let him who has the hawk hold his right hand on the tassel of her hood ready to unhood her as soon as you begin to lure; to which if she come well, stoop roundly upon it, and hastily seize it; let her call two or three bits thereon; that done, take her off the lure, and deliver her again to the person that held her; and, going farther off the lure, feed her as before; and so daily farther and farther off the lure. Afterwards you may lure her in company, but do not frighten her; and having used her to lure on the foot, do it also on horseback; which may be sooner accomplished, by causing horsemen to be about you, when you lure her on foot; it is also sooner done, by rewarding her upon the lure on horseback among horsemen. And when she is grown familiar this way, let somebody a-foot hold her, and be that is on horseback must call, and call the hawk about his head, while the hawk takes on the hood by the tassel; and if she seize upon the lure, without fear of a man or horse, then take off the creance, and lure at a greater distance. Lastly, if you would have her love dogs as well as the lure, call dogs when you give her plumage. See HAWKING.

FALCON, in *Gunnery*. See FALCON.

FALCON, in *Zoology*. See FALCON.

FALCONER, a name by which some authors have called the *milvus*, or *kestrel*. See FALCON.

FALCONER, a person who brings up, tames, and makes, that is tutors and manages birds of prey; as falcons, hawks, &c. The grand seigneur usually keeps six thousand *falconers* in his service. The French king has a grand *falconer*, which is an office dismembered from that of great hunt, grand veneur. The duke of St. Alban's is hereditary grand *falconer* of England.

Historians take notice of this post as early as the year 1250. One great business of the *falconer* is to consider the quality and merit of the birds, to know which to fly early, and which late. He must also be busy and cleanly in freeing them of lice, nits, and vermin. Every night after flying, he should give his bird calling; nor must he forget to water her, unless she has been bathed. After this, the hawk must be put in a warm room, having a perch, with a candle burning by her, where she is to sit unhooded, that she may nurse and pick herself. Next morning she should be weathered, &c.

FALCONET, in *Gunnery*. See FALCONET.

FALCONRY, or FALCONRY, the art of taming, managing, and tutoring, birds of prey, particularly falcons and hawks; and employing them with advantage in the pursuit of game; called also hawking. See FALCON.

The word is formed of *falco*, *falcon*, or *faucun*, the bird of molt and esteem in this kind of sport.

Falconry, though the principal amusement of our ancestors, was unknown among the Greeks and Romans. All their writings do not furnish so much as a proper name to call it by; so far are they from teaching us the terms. It is the French language alone, that has particular words for all the parts of *falconry* and hunting; and from them most of our terms, as well as what we know of the art itself, are borrowed.

This diversion was in such repute so late as the reign of James I. that Sir Thomas Monson is said to have given a thousand pounds for a cast of hawks; and the laws were very rigorous that tended to preserve this pleasure. In the 34th of Edw. III. it was made felony to steal a hawk; and to take its eggs, even in a person's own ground, was punishable with imprisonment for a year and a day, besides a fine at the king's pleasure; and in the reign of queen Elizabeth, the imprisonment was reduced to three months; but the offender was to find security for his good behaviour for seven years, or to remain in prison till he died. According to *Olearius*, the diversion

diversion of *falsury*, is more followed by the Tartars and Persians than it ever was in any part of Europe. Tom. i. p. 217, 328. See Pennant's British Zoology, vol. i. p. 171, &c.

The writers of reputation on *falsury*, are Desparon, Franchiere, Tassilue, Artelouchier, Dalagosa, Lallam, &c. M. de St. Martha has put the principles of the art into fine Latin verses, in his Hieroglyphicon, five De Re Accipitatoria, libretto.

There is also a treatise on hunting, hawking, and heraj-dry, printed at St. Alban's by Cayton, and attributed to dame Julian Barnes.

FALD-fee, or **FALD-foy**, was anciently used for a rent or fee paid by some customary tenants, for liberty to fold their sheep upon their own land.

FALDAGE, an ancient privilege, which several lords reserved to themselves of letting up sheep-folds, or pens, in any fields within their manors, the better to manure them; and this not only with their own, but with their tenants' sheep.

This was also termed *fella falde*; and in some old charters *fella-fala*; in some place a fold course, or tree-fold.

FALDELLA, a word used by some of the writers in surgery for a sort of compresse made of silk connoted together in several doubles.

FALDUSTOR was anciently used to signify the highest feat of a bishop, inclosed round with a lattice.

FALDWORTH, among our *Old Writers*, was used to signify a person of age, sufficient to be reckoned of some decennary.

FALL, *Defect*, in *Physic*, the tendency of any heavy body towards the centre of the earth.

Galileo first discovered the ratio of the acceleration of falling bodies, viz. that dividing the whole time of falling into equal parts, the body will fall thrice as far in the second moment, as in the first; five times as far in the third; seven times in the fourth, &c. and so on in the order of the uneven numbers. See ACCELERATION.

FALL, of *humors*, for *throwing the*. See GRAVITY.

FALLING bodies, for the *weight*. See DESCENT.

FALL, water. See CASCADE.

FALL is also used in a moral sense; as, the fall of Adam. See Original Sin; the fall of the Roman empire, &c. Authors contend, that Plato had a notion of Adam's fall, which he had learnt from Moses. Esch. De Preceptis, Evangel. lib. xii. cap. 11, quotes a fable from Plato's Symposi, wherein he thinks he finds the whole history allegorically related.

FALL, in *Music* and *Poetry*. See CADENCE.

FALL, a measure of length used in Scotland, containing six of the ell of that country, each of which is equal to 37½ English inches. See MEASURE.

FALL, among *Seamen*, denotes that part of the rope of a TACKLE which is haled upon. They say also that a ship hath *fall* when she is not *dry*, but hath risings of some parts of her decks more than others. Also a ship is said to *fall off*, when being under full she keeps not to near the wind as she should do.

FALL not off, *at sea*, a word of command from him that commands the ship, signifying as much as keep the ship near the wind.

To FALL aboard of, is to strike or encounter another ship, when one or both are in motion; or to be driven upon a ship by the force of the wind or current.

To FALL a-stern, is to be driven backwards, or to retreat with the item foremost; and is expressed of the motion of a ship either under full, or at anchor.

To FALL calm, expresses a total cessation of the wind.

To FALL down, is to fall or be discolled from any part of a river, towards some other part nearer its mouth or opening.

Car-FALL. See CAT-heads.

FALLACY, **FALLACIA**, a deception, or false appearance, or report.

The Epicureans deny, that there is any such thing as a *falsity* of the senses. According to them all our sensations, and all our perceptions, both of sense and phantasy, are true; they add, that sense itself is the first grand criterion of truth. That the senses are never deceived, they argue from their being incapable of all ratiocination and remembrance; hence they can neither add, take away, couple, nor disjoin, they cannot, therefore, infer, conclude, or invent; and consequently they cannot deceive by any inference or invention. This the mind may do, but not the sense, whose business is only to apprehend what is present, e. g. colours; not to discern or distinguish between this body and that. But a thing that barely apprehends, without pronouncing any thing, cannot deceive; add, that there is nothing to convict our senses of falshood. The right eye, e. g. cannot convict the left, nor Plato's eyes, those of Socrates; since the

reasons or pretensions of each are equal; and the purblind person sees what he sees as much as the lynceus. Nor can a sense of one kind convict another; as the sight, the smell, because their objects are different, and consequently their reports or judgments are not of the same things. Thus, again, if I see a stick straight when out of the water, but when it is crooked, my perception is altogether as true in the latter, as in the former case; i. e. it is true that I have the perception or idea of the crooked stick, as of the straight one; and this idea is all that the sense suggests, so that it does not deceive. Lastly, reason cannot show our senses mistaken, since all reasoning depends on previous sensations, and the senses must first be true, before any reasoning, founded thereon, can be so. Thus the Epicureans, whose system is strongly confirmed by what we have already laid down from Dr. Berkeley, concerning EXISTENCE.

The Cartesian, on the other hand, are continually exclaiming against the senses, as the great sources of all deception. Every thing with which our external senses present us, they say, should be suspected as false, or, at best, dubious, till our reason has confirmed the report. They add, that our senses, as being fallacious, were never given us by nature for the discovery of the truth, but only to point out what things are convenient and harmful to our bodies.

The Peripatetics keep a middle course; they hold, that if a sensible object be taken in its common or general view, the sense cannot be deceived about it; for the sight can see nothing but what is visible, nor can it err in perceiving what is visible, *quatenus* such. But they add that if the object be taken under its specific view, the sense may be mistaken about it; viz. from a want of the dispositions necessary to a just sensation; as a disorder in the eye, or something uncommon in the medium, &c.

FALLACY, in *Logic*, or *logical fallacy*, is a capacious argument, called also a *sophism*.

Fallacies either arise from words, or things; the foundation of an illusion and *fallacy* in words, is ambiguity, which is of two kinds; viz. simple homonymy, and amphibology.

The kinds of *fallacy* in things are very numerous; but they may be reduced to several general heads, viz. *ignoratio elenchis*, *petitio principii*, *falso causa*, *interrogatio multiplex*, *imitatio vitiosa*, *anecdotes*, & *consequens*.

FALLING-off, in *Sea-language*, denotes the movement or direction of the ship's head to leeward of the point whither it was lately directed, particularly when the sails near the wind, or lies by. See *FALL not off*.

FALLING-off is also the angle contained between her nearest approach towards the source of the wind, and her farthest declination from it when *TAVING*.

FALLING evil is a disease to which horses are subject, proceeding from ill blood and cold thin phlegm collected in the fore-part of the head, between the panicle and the brain; which being dispersed over the whole brain, causes the horse suddenly to fall, and bereaves him for a time of all sense. Spanish, Italian, and French horses, are more subject to this disease than the English.

For the cure of this disorder, bleed the horse in the neck, and again in the temple veins and eye-veins, four or five days after; anoint his body all over with a comfortable friction, and bathe his head and ears with oil of bay, liquid pitch, and tar mixed together, and keep his head warm, by covering it with a canvas cap, quilted with wool, and give him a purging or leeching.

FALLING-sickness. See EPILEPSY.

Dr. Tuberville, in the Philosophical Transactions, gives the history of a patient much troubled with the *falling-sickness*, in whole or in part he observed a great number of short worms, full of legs, and like millipedes. While these continued lively and full of motion, the fits returned daily; but upon prescribing her half an ounce of oxymel helleboratum in tanky-water, the worms and the distemper were both effectually destroyed.

FALLOPIAN tubes, in *Anatomy*, two ducts arising from the womb, one on each side of the fundus, and thence extended to the ovaries; having a considerable share in conception.

They are called *tuba*, i. e. *transports*, in respect of their form; because in their rise, or opening into the womb, they are exceedingly small, so as scarce to admit a knitting-knecle, but in their progress towards the ovaries they grow much bigger, and at length are capable of receiving the finger; from whence they contract again, and at the extremity next the ovaries are expanded into a sort of foliage, which is fringed round with innumerable little fibres, bearing some resemblance to the mouth of a trumpet.

The *Fallopian tubes* are four or five inches long; they consist of a double membrane, derived from the outer and

and inner membranes of the uterus. The extremity next the ovary, at the time of impregnation, at which time the whole tube is expanded, reaches to, and embraces the ovary; though at other times it seems to fall a little short of it, and is only slightly tied by the fringe to the under side of the ovary.

The use of the tube is, to convey the food, or rather seed of women, and other animals, from the testicles or ovaries, into the uterus. See OVARY, and UTERUS.

The inner substance is composed, in good measure, of ramifications of veins and arteries, which form a kind of reticular or cavernous body, but unlike that of the chorion. This structure makes them capable of distention and contraction, according to the quantity and stop of the blood; and consequently of being, as it were, erected in case, and of embracing the ovary at that time, which in their state of flaccidity they did not. See UTERINATION.

They take their denomination, *Fallopian*, from Gabriel Fallopius, a Modenese, who died in 1562, and who is commonly reputed the first observer of them; though we find them described long before him by Rufus of Ephesus.

The *ova*, or embryos, are sometimes detained in the tube *Fallopiana*, and cannot make their way into the womb. Instances of this kind have been frequently met with in dissections. One of the most remarkable is that related by Abraham Cyprianus, a celebrated physician of Amsterdam, in a letter addressed to Sir Thomas Millington, wherein he describes the manner in which he drew a *fœtus*, twenty-one months old, out of the tube of a woman, who lived and had several children after the operation. See *Tab. Anat. (Spina)* fig. 9. c. c., and fig. 11. cc.

FALLOPII ligamentum, called also *ligamentum Pamparti*, is the lower border of the tendon of the external oblique muscle of the belly, inserted from the fore-part of the *ova* into the pubis.

FALLOW, a colour, of a palish red, like that of a brick half burnt; such is that of a *fallow deer*, &c.

FALLOW-field, or *fallow-ground*, is land laid up, or that has lain unincult for a considerable time.

To *fallow*, is to prepare land by ploughing, long before it be ploughed for seed. To do this twice is to *rustle*, *law*, and thrice, to *trifoliate*. See PLOUGHING of *fallow*.

FALLOW-fish, or *FALLOW-fish*, in *Zoology*, a name of the canthare, more commonly called the *whetstone*, and by some authors *est-flara*.

FALLOW-cleaning machine, in *Agriculture, was invented by Mr. Aaron Ogden, a Smith, at Ashton-under-Lane, near Manchester, in Lancashire. It is intended for cleaning *fallow* from weeds, &c. which exhaust the riches of the soil. The construction and use of this machine will be understood from the following description, and the figure in *Tab. Agriculture*, fig. 1. A, A, is the frame; B, the first roller; C, the second roller, in which last are two cranks to move the arms D, D, which work the rake up the directors fixed on the plank E. The under sides of the lower ends, or flutes, of these directors, are sharp to cut the clods, and let them come on the upper side. Each alternate heel of the flares is longer than the intermediate one, that they may not have more than one half to cut at once. At the back of the plank E, are two screws to let it loose, that the directors may be set higher or lower. The flares are to penetrate the ground two or three inches, to raise the clods till the rake I, I, catches them into the cart H, where a man must be ready with a mock-hoe to clear them backward, when gathered. To the rake I, I, are two teeth for every space of the directors, that flares, &c. may be gathered without damage. K, K, are two flukes, by which the machine is drawn; under them at L, are two hooks, placed low to raise the machine in turning, by the help of the traces; and the axle-tree of the cart should be fixed upon a pin, that it may turn like a wagoner. F, F, are the triggers to throw the rake behind the roots. The long teeth at G, G, are to cleanse the roller C. I, I, is the rake which gathers up the weeds into the cart H, and is drawn above the trigger F, by the working of the arms D, D, expressed by the dotted lines at d, d, &c. The triggers F, of which there is one on each side, move on the pivots as to that when the point I, of the rake I, have been drawn up by the directors E, to the part marked e, the trigger, giving way, permits the rake to pass; but immediately falling, the rake returns along the upper surface of the trigger marked e, and of course falls on the weeds when it comes to the end, a little beyond the pivots. The reader will observe, that the boarding is taken away on one side in the plate, in order to give a more perfect view of the inner parts of the machine; and, in (G), it would, perhaps, be better if all the boarding, marked L, L, L, was taken away, and frame*

work put in its stead. The cart, H, might undoubtedly also be made lighter. The wheels M, M, appear in the plate, to be made of solid wood; but there is no necessity they should be so. At N, is another view of the roller C, by which the disposition of the spikes may be easily comprehended. Suppose the circle O, described by the end of the roller N, to be divided by four straight lines into eight equal segments, as represented at P. Let the same be done at the other end of the roller, and parallel lines be drawn from one corresponding point to the other, the length of the rollers mark the points with figures 1, 2, 3, 4, 5, 6, 7, 8, afterwards draw oblique lines, as from 1, at the end O, to 2, at the other end, and from 2 to 3, &c. on these oblique lines the spikes are to be fixed, at equal distances, in eight directions, described on the circumference of the roller. The spikes of the small roller B, are fixed in the same manner, except that the diameter being smaller, there are only six instead of eight rows. R, is another view of the directors, with the plank E, on which they are fixed; and S is a section of a part of the plank, with one of the directors at hand, in which may be seen the heel m, from whence to the point of the flare e, is a sharp cutting edge. See the same letters, in Figure R. At T, is one of the long teeth to be fixed at G, it is bent towards the roller C, which it serves to cleanse. When the end of the rake e, after rising above s, is raised, by the motion of the arms D, D, along the upper part e, s, of the trigger F, and comes to the end beyond s; as it falls, the part of the arm, marked s, falls in the notch p, till it is again raised by the motion of the roller C, with the rake. The roller C, is to be one foot diameter, the spikes nine inches long, that they may go through the furrow (if the soil should be loose) into the hard earth, the more effectually to work the rake, which otherwise might be so overcharged as to cause the roller to drag without turning. In the rake-end s, there should be screws, with rollers or pulleys on, to give the rollers a turn off the friction, and they would likewise be the triggers more surely as the rake comes back. The rollers should also be hung so far backward, that when a wheel, or the arms of it may lie in the same plane, or parallel, with the directors, on which it comes up, which will require the frame to be two inches longer in the model. This will cause the rake to fall heavier, and drive the teeth into the roots, and bring them up without flustering. These teeth must be made of steel, very fine, and to long as to reach down to the plank on which the directors are fixed, that is to say, six inches long (the directors are also to be made six inches broad above the plank). The rake-head should also fall a little before the crank is at its extremity, which will cause the rake to push forward to let the teeth come into the roots. The rake-teeth must drop in the same plane with the roller and wheels, or on the surface of the earth. No more space should be given from the roller C, to the long teeth at G, than that the rake may just miss the spikes of the roller C, and fall on the places before mentioned. As the first roller B, was intended to cleanse the second C, more than for any other use, it may be omitted when the machine is made in larger, as Mr. Ogden has lately found that the long teeth at G, G, answer the end alone, and this renders the machine about a third part shorter. Now, to suit any sort of earth, there should be to each machine three planks, with directors at different spaces, to use occasionally, in the first, the spaces between the directors should be eight inches wide, in the second six, and the third four. This will answer the same end as having too many machines.

As there may be some objections to the rake not having the roots when it has brought them up, Mr. Ogden has several methods of cleansing it, but he would make it as simple as possible, he chuses to let it be without them at present; but suppose it should bring some roots back again with it, it will probably lose them before it gets back to the extremity, whence they will lie light, and be of but little detriment to the other coming up. Mr. Ogden would have the first machine made four feet six inches wide, the teeth divided into equal spaces, the outside into half spaces.

FALLOW-bounds. See HOUNDS.

FALLUM, in some of our *Low Latin* writers, is said to be a sort of land, and for proof of this they quote the *Moussillon Anglicanum*. De *duobus agris et viginti fallis*, &c. Jacob. But from this passage it would rather seem that *fallum* signified a measure of land, as well as *acre*. And to this day a *FALL* is a measure of length in Scotland.

FALSE alarm, in *War*, a feigned, or a mistaken *alarm*. **FALSE art**, in *History*, are those wherein the fundamental rules of the art are not observed; as if metal be put on metal, or colour on colour. See ARTS.

FALSE attack, in *War*. See ATTACK, *supra*.

FALSE DEEDS, in Perfidium. See **FAUSSE RATE.**

FALSA CLAM, in the Forest Law, is where a man claims more than his due, and is smothered or punished for the same.

FALSE CREATION. See **CONCEPTION.**

FALSE FRUIT, a flower which does not seem to produce any fruit, as those of the hazel, mulberry-tree, &c.

A **FLOWER** of this kind does not arise from any embryo, and does not knit; such are the male flowers of the melon, cucumber, &c.

FALSA GALINA. See **BLIND** and **GALLINA.**

FALSA GALLOP, in the Mares. See **GALLOP.**

FALSA IMPRISONMENT, is a trespass committed against a man, by imprisoning him without sufficient authority; which authority may arise either from some process from the courts of justice, or from some warrant from a legal officer, having power to commit, under his hand and seal, and expelling the cause of such commitment; or from some other special cause, warranted on account of the necessity of the thing, either by common law, or act of parliament; such as the arresting of a felon by a private person without warrant; the impressing of mariners for the public service, or the apprehending of waggons for misbehaviour in the public highways. Stat. 7 Geo. III. cap. 42. **FALSA IMPRISONMENT** also may arise by executing a lawful warrant on process on an unlawful day, as on a Sunday. Stat. 29 Car. II. cap. 7. or in a place privileged from arrests, as in the verge of the king's court. The means of removing the actual injury of false imprisonment are fourfold; viz. by a writ of HABEAS CORPUS, by writ de vi et contra pacem, by writ de homine replegiando, and by writ of HABEAS CORPUS. The satisfaction remedy for this injury is by an action of trespass, *vi et contra pacem*, usually called an action of false imprisonment; which is generally, and almost unavoidably, accompanied with a charge of assault and battery also; and therein the party that recover damages for the injury he has received; and also the defendant is, as for all other injuries committed with force, or *vi et contra pacem*, liable to pay a fine to the king for the violation of the public peace.

FALSA JUDICIUM. See **FALSO JUDICIUM.**

FALSA KIEL, in a ship, is a second keel, which is sometimes put under the hull, to make the vessel deeper, and to preserve the lower side of the main keel. In our largest ships of war, the false keel is generally composed of two pieces, which are called the upper and the lower false keels. See **TAB. SHIP. fig. 2. n. 54. and n. 113.**

FALSA MISTIA, is when four men pass in review, as are not actually lifted as soldiers. See **FAGGOT,** &c.

FALSA MISTIA, spreading of, in order to make discord between the king and nobility, or concerning any great man of the realm, is punishable by common law with fine and imprisonment; which is confirmed by Statute. *Westm. 1. 3 Edw. I. cap. 34. 2 Ric. II. stat. 1. cap. 5. 8 & 13 Ric. II. cap. 11.*

FALSA MISTIA. See **PERJURY.**

FALSA, or falsa position, in Arithmetic. See **POSITION.**

FALSA POSITION. See **PAGNIFICIUM.**

FALSA POSITION of a ship. See **FALSA QUARTERS.**

FALSA RITA. See **SPIRITUS RITA.**

FALSA RITA of a house, is that part between the upper room and the covering.

FALSA RITA. On a false return by a mayor, &c. to a mandamus, or by a sheriff, &c. to a writ, a special action on the case will lie.

FALSA RITA, is that of which the value is negative. E. gr. in the equation $x + y^2 = x^2$, if x be a negative quantity $x = -5$, the rest is said to be false; if it be a positive quantity, it is called a real or true rest; if it be the rest of a negative quantity, it is said to be imaginary; as $x = -5$.

FALSA RITA, on board a ship. See **SHEAT.**

FALSA RITA, in a ship. See **STEM.**

FALSA RITA, in Law, is used where persons get money or goods into their hands by forged letters, or other counterfeit means. This is punishable by imprisonment by Stat. 33 Hen. VIII. cap. 1. By 30 Geo. II. cap. 24, a farther penalty is inflicted on those who obtain money or goods by false tokens and pretences. See **CHEATS.**

FALSA RITA, in Astrology. Some call the interval of two semitones major by this name; but others more properly call it diminished third.

FALSA RITA. See **WEIGHT.**

FALSA RITA. See **WEIGHT.**

FALSHOOD, FALSHY, in Philosophy, an act of the understanding, representing a thing otherwise than it is, as to its accidents; or false enunciation, or judgment of any thing.

The circumstance, as to its accidents, is of absolute necessity in the definition, because a thing cannot be represented otherwise than it is as to its accidents; for in such

case the essence of the thing would not be represented; and since the essence is the thing itself, it would not be that thing which is represented, but another.

There is no falshood in apprehension or sensation: our ideas of sense are all just and true, in far as they go; and all our delusions arise from our reasonings and conclusions from them.

FALSI CRIMES, in the Civil Law, is a fraudulent subornation of concealment, with design to darken or hide the truth, and make things appear otherwise than they are.

The *crimen falsi* is committed three ways. By words, as when a witness swears falsely, by writing, as when a man frames or attests something, attesting a contract, or the like. See **FORGERY.** And by deed, as when he sells by false weights and measures, &c. the coin, &c.

FALSIFY, in Law, is used for proving any thing to be false. Hence we find

FALSIFYING a writ, for showing it to be incorrect. This lawyers teach, that a person purchasing land of another, who is afterwards outlawed of felony, &c. may falsify the record, not only as to the time wherein the felony is supposed to have been committed, but also as to the point of the offence. But where a man is found guilty by verdict, a purchaser cannot falsify, as to the offence, though he may, for the time where the party is found guilty generally in the indictment, because the time is not material upon evidence. 2 Hawk. Pl. Crown, 459. We also meet with

FALSIFYING a recovery. Thus, it is said, the issue in tail may falsify a recovery suffered by a tenant for life, &c.

FALSO BORDINE, in the Italian Music, is used to denote the burden or ground-bass of a song, when it is not exact to the rules of harmony, i. e. when the notes move all the same way, as is often the case in the Madrigals, and other parts of divine office. The name is more particularly given to a certain harmony produced by the accompaniments of several voices following one another, which make several fourths between two higher parts, because the third part is obliged to make thirds with the bass.

FALSO JUDICIUM, a writ which lies for false judgment, given in the county court, court-baron, or other court, out of record.

FALSO JUDICIUM brevium, a writ which lies against the sheriff, who has execution of process, for making false returns of writs.

FALUN, a word used in many parts of France, as the name of a particular sort of measure of lands, which is dug out of the earth, and is no other than fragments of sea-shells buried at considerable depths, and smelted in prodigious furnaces in many parts of that kingdom. These they spread on the land, in the manner of dung; and being as it were calcined and very friable, they readily dissolve, and are the finest manure of any for some soils.

FALX, in Anatomy, a part of the dura mater, descending between the two hemispheres of the brain, and separating the fore-part from the hinder.

It is called *fala*, i. e. *falk*, because of its curvature, occasioned by the convexity of the brain. It divides the brain as low as the corpus callosum.

FALX, the false fish, in Ichthyology, a small fish of the tenia kind, common about the shores of the Mediterranean, but seldom brought to sale, because of its glutinous nature, being wholly converted into a sort of glue, when dressed. It is a soft and smooth oblong fish, and has its name from resembling a sickle in figure. It is often found an ell long, and with that length is not above the breadth of one's hand. It is of a silvery colour, but its back-fin is red. Its eyes are large, and its head very ill shaped. The common people call it the marmos-fish.

FALSA CANIS, by the Greeks called cynos canis, q. d. dog-appetite, is such an insatiable hunger as is not to be satisfied with eating, but continues even when the stomach is full.

This is a case much talked of by the ancients, and sometimes met with among us. It may be supposed to arise from sharp fretting juices in the stomach, which by their continued vexatious excite a stake like that of hunger. See **BOLIMY.**

FAMILIA, FAMILY, commonly implies all the servants belonging to a particular master.

In another sense, *famula* is taken for a portion of land, viz. so much as is sufficient to maintain one family.

The term *habe* is by our writers sometimes rendered a manse, sometimes a family, and sometimes a manse, or plough-land; containing as much as one plough and even could cultivate in a year.

FAMILIA, in Natural History, a term used by authors to express a certain order of animals, or other natural productions, agreeing in their principal characters, and containing numerous individuals, not only different from one another, but in whole sets, several numbers being to be collected out of the same family, all of which have

have the family character, and all some subordinate distinction peculiar to that whole number; or though found in every individual of it, not found in those of any others.

It has been too common to confound the words, *clasi*, *family*, *order*, &c. in natural history. But the determinate meaning of the word *familia* seems to be that larger order of creatures, under which classes and genera are subordinate distinctions. Among the quadrupeds, the several genera of the unguiculated creatures agree one with another in many general characters common to all; and in which they differ from the ungulated animals, which have also their several peculiar characters common to all, and yet different from all those of the others. These naturally constitute certain larger divisions into *families*, and no one would ever break through these, or bring the cat and the horse into the same family.

In the same manner, in *botany*, there are several genera of fishes, which agree perfectly in certain common characters, and disagree from all others in them.

The arrangement of natural bodies into these *families*, or general and larger classes, is of the utmost use in natural history, when it is properly done, and the divisions are genuine and natural; when otherwise, it is harmful.

These divisions of animals into families are of two kinds, the one artificial or hypothetical, the other natural.

FAMILIARS of the *Inquisition*, persons who assist in apprehending such as are accused, and carrying them to prison. They are assistants to the inquisitor, and called *familiares*, because they belong to his family. In some provinces in Italy they are called cross-bearers, and in others the scholars of St. Peter the Martyr; and they were a cross before them on the outside garment. They are properly bailiffs of the inquisition; and the vile office is esteemed to be honourable, that noblemen in the kingdom of Portugal have been ambitious of belonging to it. Nor is this surprising, when it is considered that Innocent III. granted very large indulgences and privileges to these *familiares*; and that the same plenary indulgence is granted by the pope to every single exercise of this office, as was granted by the Lateran council to those who favoured the Holy Land. When several persons are to be taken up at the same time, these *familiares* are commanded to order matters, that they may know nothing of one another's being apprehended; and it is related, that a father and his three sons, and three daughters, who lived together in the same house, were carried prisoners to the inquisition without knowing any thing of one another's being there till seven years afterwards, when they that were alive were released by an act of faith. *Geodesic Trials*, vol. 1. p. 425-429. Limborch's *Hist. of the Inquis.* by Chandler, p. 187.

FAMILY of *curves*. See *FAMILY OF CURVES*.

FAMILY of *heresies*, in *ecclesiastical history*, the name of an anabaptist sect, founded in Holland, in 1553, by Henry Nicholas, a Westphalian. This deluded fanatic maintained, that he had a commission from heaven to teach men, that the essence of religion consisted in the feelings of divine love; that all other theological tenets, whether they related to objects of faith, or modes of worship, were of no moment; and that it was a matter of perfect indifference what opinions Christians entertained concerning the divine nature, provided their hearts burned with the pure and sacred flame of piety and love. Dr. Henry More wrote against this sect, in his *Grand Explanation of the Mystery of Godliness*, book vi. chap. 11-18. George Fox, the founder of the sect of quakers, also exposed them, and called them a motley tribe of fanatics, because they took oaths, danced, sung, and made merry. The principles of this sect were propagated in England, and produced no small confusion. The form of abjuration tendered to them, and the severe proclamation issued against them by queen Elizabeth, in 1580, may be seen in Wilkins's *Concilia Magnae Brit.* &c. vol. IV. p. 266, 267.

FAN, *Ekblom*, a machine used to raise wind and cool the air by aspirating it.

The effect of fanning ourselves, when warm, in order to cool us, though the air is itself warm, which we drive with the fan upon our faces, may be thus explained: the atmosphere round, and next to our bodies, having imbibed as much of the perspired vapour as it can well contain, receives no more, and the evaporation is therefore checked and retarded till we drive away that atmosphere, and being drier air in its place, that will receive the vapour, and thereby increase and facilitate the evaporation; and thus contribute to cool us.

That the use of the fan was known to the ancients, is very evident from what Terence says,

Cuteba Rabellum, & ventum huius sit facies
and from Ovid, *Art. Amant.* l. 161.

Probat & *traxit* ventum *mirabile* Rabello.

The fans of the ancients were made of different materials; but the most elegant were composed of peacock's feathers, or perhaps painted, so as to represent a peacock's tail.

The custom which now prevails among the ladies, of wearing fans, was borrowed from the East, where the hot climate renders the use of fans and umbrellas almost indispensable.

In the East they chiefly use large fans made of feathers, to keep off the sun and the heat. In Italy and Spain they have a large sort of square fans, suspended in the middle of their apartments, and particularly over the tables: these, by a motion at first given them, and which they retain a long time, on account of their perpendicular suspension, help to cool the air, and drive off flies.

In the Greek church, a fan is put into the hands of the deacons in the ceremony of their ordination, in allusion to a part of the deacon's office in that church, which is to keep the flies off the priests during the celebration of the sacrament.

Wilschke, in his translation of the embassy of Garcia de Legorria, gives the name *fan* to a kind of chimneys or ventilators in use among the Persians, to turn off air and wind, into their houses: without which the heat would be insupportable. What is called a fan amongst us, and throughout the chief parts of Europe, is a thin skin, or piece of paper, taffety, or other light stuff, cut semicircularly, and mounted on several little sticks of wood, ivory, tortoise-shell, and the like.

If the paper be single, the sticks of the mounting are passed on the least ornamented side: if double, the sticks are placed betwixt them. Before they proceed to place the sticks, which they call *mounting the fan*, the paper is to be plaited in such manner, as that the plaits may be alternately inward or outward.

Is it in the middle of each stick, which is usually about half an inch broad, that the sticks are to be called, and these again are to be all joined and drawn together at the other end; they are very thin, and therefore exceed one third of an inch in breadth; and where they are pushed to the paper, are still narrower, continuing thus to the extremity of the paper. The two outer ones are bigger and stronger than the others. The number of sticks rarely exceeds twenty-two. The sticks are usually provided by the cabinet-makers or toy-men; the fan-painters plait the papers, paint, and mount them.

The common painting is either in colours of gold leaf, applied on a silver ground, both prepared by the gold-beaters. Sometimes they paint on a gold ground, but it is rarely; true gold being too dear, and false too paltry. To apply the silver leaves on the paper, they use a composition, which they pretend is a great secret, but which appears to be no other than gum Arabic, sugar-candy, and a little honey melted in common water, and mixed with a little brandy. This composition is laid on with a sponge; then laying the silver leaves thereon, and pressing them gently down with a linen ball stuffed with cotton, they catch hold, and adhere together. When, instead of silver, gold ground is laid, the same method is observed.

The ground being well dried, a number of the papers are well beaten together on a block, and by this means the silver or gold get a lustre, as if they had been burnished.

FAN is also an instrument to winnow corn. See *WIND-MILL*.

FAN, *fan*. See *GORGONIA*.

FANATIC, a wild, extravagant, visionary, enthusiastical person; who pretends to revelation and inspiration, and believes himself possessed with a divine spirit.

The word is formed of the Latin *fanus*, a *heaven temple*, for which reason the Christians called all the Gentiles *fanatics*; and accordingly the ancient chronicles of France called Clovis, *fanatic* and Pagan.

Among the Heathens themselves, there were a sort of prophetic priests, called *fanatici*, from whom the denomination since passed to all the rest. They had their name from the Latin *fanus*, temple, because they lived all together in temples. *Struv. Antiq. Rom. Sent.* cap. 6. p. 312.

Of this kind particularly were the priests of *Isis*, of the mother of the gods, of *Bellona*, and some others, who were called *fanatici*. In Gruter, p. 312. n. vii. we have an inscription, wherein one L. Cornelius Januarius is called *Fanaticus*, *AR. IIII. SERAPI. ABADEM BELLONE*. And, p. 645. n. vii. *Fanaticus de sede Helimae*. What might give occasion to the appellation of *fanaticus* was, that they performed their sacrifices in a wild, enthusiastical manner; and the appellation has been generally applied in modern times to those who have made pretences to inspiration, and who have conducted their worship or practice in an extravagant and licentious manner. Such were some of the German anabaptists and English

English quakers, at their first rise, and the modern prophets, Muggletonians, Behmenists, &c. And the name *fanatics*, as well as *sectaries*, has been generally and individually applied to dissenters from the church of England. See **SUPERSTITIOSITY**.

FANATIO, in our *Antient Customs*, the fawning time, or flattery-mouths in flocks.

FANCY. See **PHANTASY**, and **IMAGINATION**.

FANIONS, in *Military Language*, small flags carried along with the baggage. See **FLAG**.

FANTASIA, in the *Italian Music*, signifies fancy, and is used for a composition, wherein the composer ties himself to no particular time, but ranges according to his fancy leads, amidst various movements, different airs, &c. This is otherwise called the *capriccio stile*: before *sonatas* were used there were many of this kind, some of which remain even now.

FANTASTICAL actors, are the same with those called **EMPHATICAL actors**.

FANTOME corn, in *Husbandry*, a term used by the farmers in some of our counties for lean, light, and lank corn; as they call in the same places *fantome* flesh, that which is lean and poor, and can hardly hang on the bones.

FANUM, among the Romans, a temple or place consecrated to some deity. The deified men and women among the heathens had likewise their *fanæ*; even the great philosopher Cicero erected one to his daughter Tullia. Mem. Acad. Interp. vol. I. p. 488, seq.

FAPESMO, in *Logic*, one of the moods of syllogisms. A syllogism in *Fapesmo* has its first proposition an universal affirmative, the second an universal negative, and the third a particular negative.

FAQUIR. See **FAKIR**.

FAR, in *Husbandry, an appellation given to any horse's right side; thus the *far foot*, the *far shoulder*, &c. is the same with the right foot, right shoulder, &c.*

FARAND-MAN, in our *Old Writings*, a traveller or merchant stranger, to whom by the law of Scotland justice ought to be done with all expedition, that his business or journey be not hindered.

FARCE was originally a dull, petty show, or entertainment, exhibited by charlatans, or quacks, and their buffoons, in the open street, to gather the crowd together. The word is French, and signifies literally, *farce-mat or stuffing*. It was applied on this occasion, without doubt, on account of the variety of jests, tricks, &c. wherewith the entertainment was interlarded. Some authors derive *farce*, from the Latin *farctus*; others from the Celtic *farce*, *masonry*; others from the Latin *farctus*, *to stuff*.

At present, *farce* is of a little more dignity. It is removed from the street to the theatre; and instead of being performed by merry-andrews, to amuse the rabble, is now acted by our comedians, and become the entertainment of the polite audiences.

The poets have reformed the vices of the primitive *farce*, and brought them to the taste and manner of comedy. The difference between the two on our stage, is, that the latter keeps to nature and probability; and, in order to that, is confined to certain laws,unities, &c. prescribed by the ancient critics.

The former distends of all laws, or rather sets them all aside on occasion. Its end is purely to please, or to make merry; and it sticks at nothing which may contribute thereto, however wild and extravagant. Hence the dialogue is usually low, the persons of inferior rank, and the fable or action trivial or ridiculous; and nature and truth are every where heightened and exaggerated to afford the more palpable ridicule.

FARCIMINABUS *Troica*, the same with **ALLANTOIS**. **FARCIN**, **FARCY**, or **FARIGONY**, a disease in horses, and sometimes in oxen, &c. somewhat of the nature of a scabies or mange.

Geiser derives the word from *varices*, by changing the *v* into a *f* digamma or *f*.

The *farce* is infectious, and spreads like a true plague. Vegetius calls it *maris farcinifera*. It consists in a corruption of the blood, which shows itself in eruptions of hard pustules, knots, or strings along the veins, and in ulcers, which are not cured without great difficulty, by running hot from them.

There is a *spreading farce* which diffuses itself over the whole body; an *inner farce*, a *ringed farce*, &c.

The *farce* is ordinarily occasioned by excessive heats and colds; sometimes by spur-galling with rusty spurs, fluribit, or the like; or by the bite of another horse infected with it; or if in the leg, by cutting or interfering.

For the cure, first bleed the horse well, then give him four ounces of cream of tartar and lozime electricity made into balls every other day for a week; and then give him three ounces of nitre every day for three weeks or a month; and anoint the body and swelling twice a

day with the following ointment, viz. ointment of elder, four ounces; oil of turpentine, two ounces; sugar of lead, half an ounce; white vitriol powdered, two drams; and let these several ingredients be mixed together in a galley-pot. By this process the tumors will sometimes dissipate; but if they break and discharge a well-digested matter, they will soon be well, by giving liver of antimony in the quantity of two ounces a day for a fortnight, and once a day for another fortnight. This will be the case when the disease affects only the smaller vessels; but if it affects the larger blood-vessels, the cure will be more difficult. When the plate, thigh, or neck-veins appear chorded, bleed immediately on the opposite side, and apply to the distended vein the following composition, viz. six ounces of oil of turpentine, and three ounces of oil of vitriol: the oil of vitriol must be dropped gently into the turpentine-oil, or else the bottle in which it is contained will burst. Let the diseased parts be still rubbed with a woollen cloth, and then apply some of this mixture twice a day. Let the cooling physick and nitre, and liver of antimony be used, as above directed; and let the foree be dressed with bees-wax and oil.

If the disease is situated near the flanks and lower belly, and does not yield to the compound oil, it may be necessary to bathe the parts with the following mixture as far as the centre of the belly, and to give a course of antimonial medicines. Take four ounces of spirit of wine; oil of vitriol and turpentine, of each two ounces; white wine vinegar, or verjuice, six ounces. When the distemper becomes inveterate, notwithstanding the preceding application, Gibbon recommends the following mixture, viz. half a pint of luscified oil; oil of turpentine and nitre, of each three ounces; tincture of opobalsam and heliobore, of each two drams; the selder's ointment, or oil of bays, two ounces; oil of origanum, half an ounce; doctho-agua fortis, half an ounce: when the chustition is over, add two ounces of Balsamoe tar. With this mixture rub the tumors and chorded veins once in two or three days, opening a passage to the matter issuing from the ulcers if they are choked up, with a small hot iron, and destroying with vitriol the proud flesh, which may be kept down by touching with oil of vitriol, aqua fortis, or butter of antimony. Dr. Bracken recommends the mercurial ointment for rubbing the chords and tumors before they break, in order to dissipate them; and when they are broke, to dress the sores with equal parts of Venice turpentine and quicksilver. Mercurials have been likewise given internally in various ways; two ounces of quicksilver divided with an ounce of turpentine, and made up into four balls with diapente and gum punicum, of each two ounces, with a sufficient quantity of honey, have been successfully given in the quantity of one ball twice a week; but when mercurials are administered either internally or externally, gentle purgatives should be interposed to prevent a salivation.

The *water-farce*, which is a kind of dropsy, proceeds from a horse's feeding on low watery grounds, and in pits or holes where the grass grows above the water; for the horse in picking out the grass licks up the water, which occasions him to swell under the belly or chest.

The *water-farce* is of two kinds; one produced by a feverish disposition, terminating on the skin; and the other a true dropsy, in which the water is not confined to the belly and flanks, but is found in different parts of the body, where a great number of soft swellings appear, which yield to the pressure of the finger. The first species may be relieved by slight scarifications in the inside of the leg and thigh with a sharp penknife; but in the other species the water must be discharged and the crasis of the blood recovered by a purge given every week or ten days, and immediately after the first the following balls: take of nitre, two ounces; squills powdered, three drams, or half an ounce; camphor, one dram, and a sufficient quantity of honey to bring them of a due consistence for balls. This ball should be given once a day, and washed down with a horn or two of the following drinks: take of black heliobore, fresh gathered, two pounds; walls, bruise, and boil it in six quarts of water till it is reduced to four; strain off the liquor, and pour on the remaining heliobore two quarts of white wine; place it in a gentle heat, and let it infuse forty-eight hours; strain it off, and mix both together, and give the horse a pint eight and morning. When the horse begins to recover, complete the cure by giving him half a pint of the following infusion every night and morning for a fortnight, and let him fast two hours after it: take gentian-root and zedoary, of each four ounces; chamomile-flowers and the tops of centaury, of each two handfuls; of Jesuit's bark, powdered, two ounces; of juniper-berries, four ounces; of blings of iron, half a pound; infuse the whole in two gallons of ale for a week, shaking the vessel often.

We have in the Philosophical Transactions an account of a horse

a horse being cured of this disease by hemlock. The discovery was accidental; the master of the horse riding near a place where hemlock grew abundantly, suffered his horse to eat greedily of it, and he became better from that time, and in a few days was wholly cured. We generally esteem hemlock a poison; but beside this proof of its salutary effect, it is well known that its seeds are eaten by some birds, particularly by the buzzards, in very great quantities, without any harm.

FARDEL of *Lund*, is, according to some authors, the fourth; according to Noy, only the eighth part of a yard-land. See **YARD-LAND**.

Decem acra fallens ferelliam, quatuor ferellia facinus virgatum, Equiter virgata facinus hidam, & quatuor hile virgata facinus hidam.

FARDING-BAG, the first stomach of a cow or other ruminating animal.

FARDING-DEAL or **FARDING-LAND**, in our *Ancient Customs*, signifies the fourth part of an acre, now called a *rand*. In the register of writs we have *allotmentaria, allotmentaria, allotmentaria, allotmentaria*, which must probably rise in proportion of quarters from the *farding-deal*, as an half-penny, penny, shilling, and pound, rise in value; on which footing *allotmentaria* must be half an acre, *decem acra*, an acre, *quatuor acra*, twelve acres, and *librata*, twelve-four acres.

Yet we find *quatuor libratas terra, vel statera*. Reg. fol. 64. a. and 284. b. where *librata terra* should seem to be as much as yields 24 s. for an acre; and *terram libratam* *terram, tantummodo*, & *reditum*, fol. 249. a. Others hold *allotmentaria* to be but half a perch, and *decem acra* a perch.

FARDINGDEAL was the fourth part of a yard-land, or of a plough-land, according to Spelman.

FARL, a voyage or passage, or the money paid for passing by water, &c.

For the *farla* of hackney-coachmen, watermen, &c. see **HACKNEY-COACHMEN**, and **WATERMEN**.

FARL of pigs, the number which a sow brings forth at one time.

FARIN, in *Ichthyology*, a name given by the Swedes to a fish peculiar to their country. It is of the genus of the *cyprinus*, and is distinguished by Arted by the name of the *farina cyprinus*, with twenty-seven bones in the pinnæ and.

FARFARA, a name given by some of the ancient *Botanists* to the plant we call *colt's-foot*, from the river *Farfara*, mentioned by Ovid as remarkable for its shady banks, which afforded a very large quantity of this plant. Piny mentions this plant with much confusion, calling it also *farfara* and *farfara*, and forgetting that he had before described it under the name of *hyssopus* or *lechitum*.

FARERUGUM, in *Botany*, a name by which some authors have called the *callosa palustris*, or *morch* *stank-bol*.

FARFUGIUM, in *Botany*, a name by which some authors call *colt's-foot*.

FARINA, the flour or powder of some sort of grain or pulse, ground and sifted from the bran.

The word is formed of *far*, *carum*, *vest*; and *for*, according to Guichard, comes from the Hebrew, *far*, *far*, signifying the same thing.

FARINA forwandens, or *farina*, among *Naturalists, is a fine dust prepared in the male flowers, or the male parts of flowers of plants; which, being afterward fixed on the female, does the office of a sperm or semen, by impregnating the female.*

The *farina forwandens*, called also the *male dust* and *male seed*, is formed and secreted in the apices or anthers of the stamens; where, when it becomes mature and copious enough, bursting its capsule, it is split on the head of the stili, and thence conveyed to the matrix or uricle thereof, to fecundify the ova or female seed contained therein.

This dust in any one plant being viewed with a microscope, every particle thereof appears of the same size, and figure; but in different plants the figure, size, colour, &c. of the dust are very different.

It may be observed, however, that the colour of the *farina* varies in the same species, according to the colour of the flower; and even sometimes the *farina* of the same flower is of different colours, as is easily observed in the *carophyllus arvensis*.

The figures of the divers kinds of *farina* are much harder to describe. The most general figure is the oval, more or less sharp at the ends, with one or more channels or furrows running lengthwise; so that through the microscope they look not unlike the stone of a date, a grain of wheat, a coffee-berry, or an olive.

The manner of gathering and preserving the *farina* of plants for microscopic observations is this: gather the flowers in the middle of a dry sunny day, when the dew is perfectly off; then gently shake off the *farina*, or

lightly brush it off with a soft hair-pencil upon a piece of white paper; then take a single tale or slip of paper between the fingers, and brushing on it, apply it instantly to the *forina*, the moisture of the breath will make that light powder stick to it. If too great a quantity be found adhering to the tale, blow a little of it away; and if there be too little, breathe on it again, and take up more. When this is done, put the tale into the hole of a slide, and applying it to the microscope, see whether the little grains are hid as you desire; and if they are, cover them with another tale, and fix the slide; but be careful that the tales do not press upon the *forina*, so as to alter its form. Baker's Microscope, p. 259.

For the appearances of the *forina* of a great many plants, see *Tol.* of *Microscopical Objects*, Chap. 2.

Of *forina* some are very hard, others soft, and easily broken. They all contain a great deal of sulphureous matter more than the other parts, whence they are very odorous. Those of the lily are so full of oil that they grease the paper they are put in as if it had been oil. The *forina* of most aromatic plants swim in an essential oil, or sort of liquid turpentine; others are involved in a dry resin, as those of the *Euphorbia* or *milium terretre* clove-tree. Others, so thick of funtary, are inclosed in a thick, viscid, mucilaginous matter; and all, without fail, have something so glutinous, that they stick to any thing that touches them, so that it is difficult to separate the grains from each other.

Mr. Bradley supposes a magnetic virtue lodged in the *forina forwandens* or *male dust*; by means whereof, when deposited in the uricle of the female, it draws the fecundification from the other parts of the plant into the ova or rudiments of the fruit, and makes them fow. The reality of this virtue, he argues, from the fact being found in wax, which is chiefly or wholly gathered from the bees.

The *forina* of plants has been sometimes found to have an effect upon neighbouring plants, and to change their colours; changed by the *forina* of the *farina* of the *farina*, and we have observations of plants of different colours infusing one another in the like manner. Phil. Trans. N° 477. 47.

This dust was for many ages looked upon as an increment of the plant; but it is of later time been found to consist wholly of organic bodies, which are in reality the embryo-plants; and entering into the seeds into the capsules, while yet buried in the lythe, they fecundate them, and put them in a state to vegetate and produce their species. On the most accurate examination, however, with microscopes, the *forina* or *pollen forwandens* of plants has never been found to vary any otherwise than a *plantula forwandens*, or the rudiment of the plant, which was to be produced by it. And that the microscope does in this case is but increasing the apparent magnitude of the particles of the powder; but they are found, when thus viewed, to be no other than a congeries of globules, which are all alike in the same species, and composed of fibres and vacuoles wrought together in such a curious manner to the keeping whole as long as necessary, and bursting when necessary, that it appears evident they are destined for some very great use.

Verduin, in the *Acta Eruditionum*, has given a very curious detail, and has figured and described fifty kinds of this dust, most of which are considerably different from one another, though some are nearly alike. He observes, that in all the number of flowers that he examined he found no *forina* or *pollen forwandens*, that did not resemble one of these fifty; and that, therefore, whoever engages in this curious research, should first observe these, and then refer the others to one or other of them as they next approach them, and mention their differences, if any, by way of characters by which they might always be known. Act. Erudit. ann. 1724. p. 410.

The author of these curious observations has given good figures of these and of the other of the fifty of his *farina* to which we refer the reader. See *Generat. of Plants*.

FARINAGIUM, in our *Old History*, denotes toll of meal or flour.

FARIO, in *Ichthyology*, a term for *carassius* when about half grown, after it is past the state in which it is called a *salet*, and before it is of the full growth.

FARLEU, money paid by tenants in the west of England in lieu of a heriot. In some manners of Devonshire, *farleu* is often distinguished to be the best penny, as best as the best best penny at the death of a tenant.

FARME, or *farm*, in *Law*, signifies a little country enclosure or district, containing house and land, with other conveniences, hired or taken by lease, either in writing or by word, under a certain yearly rent.

This in divers parts is called differently; in the North, it is a *task*; in Lancashire, a *ferelund*; in Essex, a *ville*. In the corrupted Latin, *farma* signifies a place inclosed or shut up; whence, in some provinces, Menage ob-

leaves, they call *dispersa* or *dispersa*, what in others they call *ferm*.

Speelman and Skinner derive the word *ferm* from the Saxon, *ferma*, or *ferma*, that is, *virtus*, or *provision*, because the country-people and tenants anciently paid their rents in victuals and other necessities, though this was afterwards converted into the payment of a sum of money. Whence a *ferm* was originally a place that furnished its owner or lord with provisions. And among the Normans they still distinguish between *ferm* that pay in kind, i. e. provisions; and those which pay in money, calling the former simply *ferma*, and the latter *blanche ferme*, white *ferm*.

Speelman shows, that the word *ferm* anciently signified not only what we now call a *ferm*, but also a *trial* or *entertainment* which the farmer gave the proprietor or landlord for a certain number of days, and at a certain rate, in consideration of the land, &c. he held of him. Thus *ferm*, in the laws of King Canute, is rendered by Mr. Leveque, *vitium*, and thus we read of *reidera* *ferma* *canonice* *vitium*, and *reidera* *canonice* *vitium*, which denote provision for a night and day, the rent about the time of the Conquest being all referred for provisions the custom whereof is said to have been first altered under Henry I.

It is commonly allowed that a *ferm* should make three rents, as they express it, one for the landlord, one for the church, and one for the farmer to live upon; but it is very seldom that a *ferm* will constantly do this, or is to be maintained at that charge. In a *ferm* of one hundred pounds a year, if the land is worth twenty shillings an acre, a hundred pounds may defray the charges of it; but if in a *ferm* of the same rent the land be worth but ten shillings an acre, a hundred and thirty pounds a year must be allowed for the charges of this, or nearly so, and two hundred and fifty acres of such land must be reckoned the *ferm* of a hundred pounds a year, or else the farmer will be ruined if he be not very improvable land. By thus no person or spiritual person shall take *ferm* or lease of land, on pain of forfeiting 10*l.* per month, &c. 25 Hen. VIII. cap. 18. And no person whatsoever shall take above two *ferms* together in the same parish, under the forfeiture of three shillings and four-pence a week. 25 Hen. VIII. cap. 13. 32 Hen. VIII. cap. 28.

We also say, to *ferm* duties, imposts, &c.

FARMER, he that tenants a *ferm*, or is lessee thereof.

Also generally every kins for life, years, or at will, is called *farmer*.

As this word implies no mystery, except it be that of husbandry, husbandman is the proper addition for a *farmer*.

FARMER, in *Alfing*, is the lord of the field, or one that *ferms* the lot and scope of the king.

FARNIA, or FANNIA, *farum*, a name by which some authors have called the bitter oak, the *cornel*, *agropyron*, and other writers.

FARNIVANS, in *Ekkehard's History*, a folk of Scandinavia, so called from Farnicus Farnivius, who separated from the other Scandinavians in the year 1268, and was followed by several periodical emigrations for their landing. This folk did not last long, for having lost their chief, who died in 1265, it was scattered abroad and reduced to nothing. Farnivius was engaged by Genusus to protect the Aram system to that of the Scandinavians, and consequently advised, that Cnut had been produced out of nothing by the Supreme Being before the creation of this terrestrial globe. His sentiments concerning the Holy Ghost are not certainly known; however, it appears that he warmed this doctrine against paying the tribute of religion worship to the Divine Spirit.

FARRA, in *Ichthyology*, a name given by authors to a species of the *carassius*, not differing essentially from the *lacustris* or *perca*. This species has had a great number of different names, and been described at five or six different fish. But all the descriptions of the several authors agree to prove it to be that species only of the *carassius*, which Arted has distinguished by the name of the *carassius*, with the upper jaw longer and flat, and with fourteen rays in the back fin. This name equally agrees with the several descriptions of the *farra* or *ferro*, *varas*, *humilis*, &c. and they agree in all the essential characters with one another. See LACUARETUS.

FARREATION, FARREATION, in *Antiquity*, the same with CONPARATION.

FARRIER, a person whose office is to shoe horses, and cure them when diseased or hurt.

FARRIER's *glove*, in the *Allegory*, a leather bag, in which they carry drivers, nippers, files for all sizes of feet, good sharp nails, and all that is proper for new-shoeing a horse that has lost his shoe upon a road.

FARTHEL, or FARTHELLER, among *Saxons*, was used

Vol. II. N° 125.

for the same with what they commonly call *fast*, or *fasting*, which is taking up the fast, and binding them close to the yoke.

FARTHING, a small English copper coin, amounting to one-fourth of a penny.

It was anciently called *farthing*, as being the fourth of the integer or penny.

FARTHING of gold, a coin used in ancient times, containing in value the fourth part of a noble, or 20*l.* of gold, and in weight the sixth part of an ounce of gold. It is mentioned in the flat of Hen. V. cap. 7. where it is enacted, that there shall be good and full weight of the noble, half-noble, and farthing of gold.

FARTHING of land seems to differ from FARDING-land.

For in a survey-book of the manor of West-Hampton in Devonshire, there is an entry thus: A. B. holds six farthings of land at 11*l.* per ann. Bloom. So that the farthing of land must have been a considerable quantity, far more than a rood.

FARUNDEL of land, the same with FARDING-land.

FASCE, *fascis*, in *Herulry*. See FASCI.

FASCE, in *Antiquity*, acted tied up together with rods or barks, and borne before the Roman magistrates as a badge of their office and authority.

Plutarch, lib. I. cap. 5. shews us, that the use of *fascis* was introduced by the elder Tarquin, the sixth king of Rome, and that they were then the mark of the sovereign dignity. In after-times they were borne before the consuls, but by turns only, each his day; *et, si unus fasces haberet, duplimum tunc videtur*. Liv. lib. II. cap. 1. They had each of them twelve, borne by 60 many officers, called *lictores*. See LICITOR. Dionysii Halicarn. lib. II. cap. 84.

Others will have Remulus, the author of the institution, and ascribe the number twelve to the number of birds which foretold him his kingdom. Others hold that he borrowed it from the Hieratics, and that the number twelve answered to the twelve nations of Hieratica, who, in creating him king, gave him each an officer to serve him as *lictor*. Silius Italicus ascribes their first invention to a city of Hieratica, called Verulonis.

These *fascis* consisted of branches of elm; in the middle whereof was a scutellus or ax, the head whereof stood out beyond the rest. Plutarch relates the reason of this disposition. Publicists took the ax out of the *fascis*, as Plutarch assures us, to remove from the people all occasion of terror. After the consuls the praetors assumed the *fascis*. Censorinus, De Die Natali, observes, that the praetors had only two, though Polybius and Plutarch give them six.

In the government of the decemviri it was the practice at first for only one of them to have the *fascis*; afterwards each of them had twelve, in the same manner as the kings.

In funeral processions it was the custom to carry the *fascis* reversed, as a token of grief.

FASCETS, in *Glutination*, the iron thrust into the mouth of the bottle when made to remove them into the unrolling-drawer.

FASCHA, in *Architecture*, by the workmen called FASCIA, FASCIO, or FASCIO, a broad flat, fillet, or band, particularly used in architraves and pedestals.

The architrave consists of three *fascia* or bands; thus called by Vitruvius, as resembling twines, called in Latin *fascia*.

That author admits of no *fascia* in the Tuscan and Doric architraves; i. e. he makes it all plain, without any division or cantoning into parts or *fascia*; but the modern architects take the liberty to shunt from him in this particular. See TAB. ARCHIT. fig. 25. N° 25.

In brick-building, the joining out of the bricks beyond the windows in the several stories, except the highest, are called *fascia* or *fascia*.

These are sometimes plain, and sometimes moulded; but the moulding is only a *linea*, *convexa*, or an arch, at the bottom, with two plain copies of bricks over it; then an allegory, and a filly a bovine.

FASCIA *linea*, in *Anatomy*, a large membranous, tendinous, or ligamentary covering, very considerable both for its extent and strength, being made up chiefly of two planes of fibres, of which the external are more or less longitudinal, the internal more or less transverse. It is farther strengthened in some places by a great number of other fibres, which augment its thickness, and form particular expansions. The transverse fibres are much thicker than the longitudinal. It is fixed above to the edge of the crista of the os ilium from the large tuberosity to the anterior superior spine, to the ligamentum Fallopi, and to the aponeurosis of the obliquus externus of the abdomen, on which it runs up by a thin funiculus. It is likewise fixed in the lateral inferior part of the os ilium, and to the neighbouring parts of the ligaments, by which

which that bone is connected to the os ilium and ischium, from whence it arises over the glutei and thigh, between the membrane adiposa and muscles, all the way to the anterior and outer part of the knee. It is very thin on the pectus, but may be separated from it. It is also continued over the external anterior part of the thigh, covering the muscles which lie there, and is strongly inflected in the head of that bone, and in the upper part of the femur. It sends off elongations, which, like so many septa, run in between the muscles, and sometimes meet in such a manner as to form vaginae. It is strongest on the anterior and outer parts of the thigh, growing gradually thinner on the inner and back parts. It is strongly inflected in the linea femoris aspera, between the vastus externus and biceps, forming a sort of septum between these muscles. It furnishes particular vaginae to the muscles which lie on the inside of the thigh; and though these vaginae are thin, they are pretty strong, being chiefly made up of transverse fibres. The *fascia lata* more or less surrounds all the muscles that serve to move the os femoris on the pelvis, and also the pelvis on the os femoris. This name has been sometimes erroneously given to a small anterior superficial muscle, more properly called *musculus fascia latae*, or *musculus MEMBRANOSUS*. Winslow's Anatomy, p. 224.

FASCIA, in *Surgery*, is a filter, roller, or bandage. It is extremely difficult to form an idea of bandages without seeing them made. See BANDAGE.

FASCIA, in *Astronomy*, two rows of bright spots observed on Jupiter's body, appearing like swatches or belts. The *fasciae*, or belts of *Jupiter*, are more lucid than the rest of the disk, and are terminated by parallel lines. They are sometimes broader, and sometimes narrower; nor do they always possess the same part of the disk.

M. Huggeworth observed a very large kind of *fascia* in Mars; but it was darker than the rest of the disk, and took up the middle part thereof. See BELT.

FASCIALIS, in *Anatomy*, a muscle of the leg, called also *TARTORUS*.

FASCINATION, in *Surgery*, is the binding of swatches about a limb that is to be cured.

FASCICULATA Faba, among Botanists. See LEAV.

FASCICULUS, in *Medicine*, a term sometimes used to express a certain quantity or measure of herbs.

By *fasciculus* is meant so much as may be held in the arm when bent, and rested on the top of the hip. Physicians note it in prescription by *foss*.

FASCINATION denotes a sort of WITCHCRAFT, supposed to operate by the influence either of the eye or the tongue.

The word is formed from the Greek, *βασανισμός*, which signifies the same.

Ancient writers distinguish two sorts of *fascination*, one performed by looking, or the efficacy of the eye. Such is that spoken of by Virgil in his third eclogue:

Nepes qui torrens oculis mihi fascinat operi.

The second by words, and especially malignant praises. Such is that mentioned by the same poet in the seventh eclogue:

*Aus, si ultra placem laudabit, bacare frontem
Cicerte, ne vult necesse mala lingua future.*

Horace touches on both kinds in his first book of epistles:

*Non istis obliquis oculis nec symula quisquam
Limat, non alio officio, non facit ventos.*

FASCINES, in *Fortification*, *fagots*, are small branches of trees, or bryans, bound up in bundles, which, being mixed with earth, serve to fill up ditches, to screen the men, make the parapets of trenches, &c. See TAB. FORTIF. fig. 4.

Some of them are dipped in melted pitch or tar; and, being set on fire, serve to burn the enemy's lodgements, or other works.

A pitched *fascina* is about a foot and a half, or two feet long. Those that are used for making espalements or chandeliers to raise works or fill up ditches are 10 feet long, and 1 or 12 feet in diameter. They are formed by fixing six small pickets in the ground by pairs, so as to make little crosses, and well infused in the middle with willow bindings. On these crosses the branches are laid, which are bound round with withes at the distance of every two feet.

In the corrupt Latin they use *fascinae*, *fascinae*, and *fascinae*, to signify the pikes, *fascinae*, &c. used to incite the ancient collis, &c.

FASHION. The word is French, *fagot*, which signifies making.

FASHION is particularly used among *Artificers* for the trouble, time, and labour, employed in a piece of work, particularly of silver or gold.

It is by the *fashion* that the workmen's wages or salary is regulated.

The word is also used to denote the prevailing mode or taste.

FASHIONS, a name sometimes given to the *FASCINES*.

FASHIONS, in the *Sea-language*, two pieces of timber which form the breadth of a ship at the stern, and are the utmost timbers of the stern on each side, forming its shape, and united to the stern-post and to the extremity of the wing-transom by a rabbet, and a number of strong nails or spikes driven from without.

FASSETS, among *Jewellers*. See FACETS.

FASSUS, in our *Old Writers*, is used for a faggot of wood. It seems to come from the French, *fagot*.

FAST, a space of time wherein a person takes little or no food.

For the advantages of *fasting* with regard to health, see ABSTINENCE.

The Bramins never bleed their sick, but make them *fast*.

FAST is peculiarly used for an abstinence on account of religion, or a space of time wherein the church prohibits the use of food, or at least restrains it to certain kinds, and to certain hours.

Fasting has been practised by most nations from the remotest antiquity.

The Jews observed *fasts* from their first establishment.

Moses appointed one solemn *fast* before the feast of expiation; and where were instituted by the following prophet on different occasions: So that in the time of Zacharias there were four regular *fasts*, viz. in the months June, July, September, and December. To these they have since added three others, in memory of four distresses they have at different times suffered. Besides these, there are various kinds of *fasts*, some for themselves, others for the new moons; and some for the dead, as an anniversary *fast*, in memory of some particular person. The Septuagint, in order to distinguish these *fasts* from their doctors for a fast, use the word *nequias*, which is translated the dignity of their office. Such opinions were only designed for the private use of the *fast*, and not for the public.

There is no occasion to describe exactly the various observances that accompanied their acts of humiliation, as being generally known. Their abstinence lasted twenty-seven or twenty-eight hours, beginning before sun-set, and not ending till some time after sun-set the next day. On these days they were obliged to wear white robes, in token of their guilt and repentance; to cover themselves with sackcloth, to lie on ashes, to sprinkle them on their head, and on great occasions cover the ark of the covenant. In order to complete their abstinence, they eat nothing at night but a little bread steeped in water, seasoned with salt, or bitter herbs and pulse. Some of them continued the following day and night praying in the temple or synagogue, bare-footed, and occasionally scourging themselves.

Those that would be particularly informed of these superstitions may consult Maimonides, Leo of Modena, and Puxos.

The Egyptians, Phoenicians, and Assyrians, neighbours to the Jews, had also their *fasts*. The *fast* of the Ninivites, occasioned by the preaching of the prophet Jonas, is too well known to be insisted on.

Nor were the Greeks without their *fasts*. Aristotle informs us, that the Lacedaemonians having resolved to succour a city of the allies, ordained a general *fast* through the whole extent of their dominions, without excepting the domestic animals; and this they did for two ends, one that they might spare provision in favour of the besieged, and the other to draw the blessing of heaven on their enterprise. The Athenians, among others, had the Eleusinian and Theophrastian *fasts*, the observance of which was accompanied with strict *fasting*, particularly among the women, who spent one whole day sitting on the ground in a mournful dress, without taking any nourishment; on which account this day was called *neus*.

In a word, all the Pagan deities, whether of the male or female sex, required this duty of those that desired to be initiated into their mysteries, or of their priests and priestesses that gave the oracles, and of those that came to consult them.

In Italy *fasting* was observed much in the same way. The inhabitants of Tarentum, being betrayed by the Romans, demanded succours from their neighbours of Reggio, who immediately ordained a *fast* throughout their whole territories, with the same intention as the Lacedaemonians, viz. to render the god favourable, and to spare provisions for their allies. Their enterprise having had good success by their throwing a conveyer with provisions into the town, the Romans were obliged to raise the siege: and the Tarentines, in memory of this deliverance,

livery, instituted a perennial *fasti*. So that here we have two *fasti* for the same event; that observed by those who were the means of obtaining the deliverance, and that observed by those who received it. The Roman senate, Livy tells us, being alarmed by many prodiges, happening in a train one after another, ordered the decemviri to consult the Sibylline books; who having executed his commission, declared, that to prevent the fatal consequences, it was necessary to establish a *fasti* in honour of Ceres, to be observed every fifth year. Then Jupiter had stated *fasti* at Rome, appears from the following passage of Horace, where a mother is introduced praying to Jupiter for the recovery of her son from a quarrelsome age, and promising that the parent should purify himself in the Tiber on the morning of the *fasti* sacred to that god:

*Frigeia si furvus quartanus reliquerit, illi
Mox die qui te iudicat Junia, nudi
In Tiberis pulvis.*

Fasti must have been very sacred at Rome, since we find it practised by kings and emperors. Numa Pompilius, Julius Cæsar, Augustus, Vespasian, and others, we are told, had their fixed *fasti*; and Julian the Apostate was so exact in this observance as even to oblige the priests themselves, and the most rigid philosophers.

In a word, every country, nation, and religion, have had at all times their priests, druids, gymnosophists, and philosophers, who distinguished themselves by their frugality, austerities, and abstinence. The practice of the Pythagoreans is well known; their whole life was a continued fast, but with this difference between them and us, that they believed the use of fish equally unlawful with that of flesh. They lived entirely on bread, fruits, and pulse, with great sobriety, in imitation of their master Pythagoras; though in this respect they must have fallen far short of him, if we may believe Diogenæ Laertius, who says that he continued his *fasti* for no less than forty days. Apollonius Thyaneus, one of his most famous disciples, could never by all his endeavours equal his master in this point, though his *fasti* greatly exceeded the ordinary intervals.

The gymnosophists or brachmans reckoned *fasti* among their religious duties. Father Le Comte, in his Memoirs, tells us, that the Chinese have at all times had regular *fasti*, with forms of prayer, for preserving them from barrenness, foundations, earthquakes, and such like public calamities. The Mahometans too, who possess to large a part of Asia and Africa, have times of *fasti*, called by them *ramadan*, as regular as we have lent; and their devotes are remarkable for their mortification and *fasti*. Compt. Mem. tom. ii. p. 142.

The Turks are so scrupulous on the point of *fasti*, that they will not at a thousand times so much as make the fault of any persons by the nose. They hold that those who themselves break *fast*, if they bathe, it is forbid to mix the head under water for fear of swallowing any oil; and as for women, they are forced to bathe at all on *fasti* days, for a reason peculiar to the sex.

It was not unusual among the ancients to *fasti* in account of dreams.

Mr. Bayle observes, that whole books have been written on long *fasti*. Cyprianus Lenculus has composed one, De Prodigiis Ineditis. Fortunius Licetus professor of medicine at Padua, besides a great many others, has published one book in folio, De iniquis animarum sine Alimento, or De Feris Altricis Animæ.

Though *fasti* is not positively enjoined by Christ or his apostles, a custom prevailed among the first Christians of joining abstinence with their prayers, especially when they were engaged in affairs of extraordinary importance. But in the most ancient times we find no mention of any public and solemn *fasti*, except upon the anniversary of Christ's crucifixion. However, in process of time, days of *fasti* were gradually introduced, first by custom, and afterwards by positive appointment; though it is not certain what those days were, nor whether they were observed in the first century. Mr. Mosheim acknowledges, that those who affirm, that in the time of the apostles or soon after, the fourth and sixth days of the week were observed as *fasti*, are not destitute of specious arguments in favour of their opinion. Ecclesi. Hist. vol. i. p. 106. lvo.

Towards the close of the third century *fasti* was held in much greater esteem, from a notion that it served as a security against the power of demons, who directed their stratagems principally against the luxurious. About the end of the fourth century this notion still more generally prevailed; and *fasti* was also considered as the most effectual means of appeasing the anger of an offended deity. Hence proceeded the establishment of this practice as an indispensable duty, by express laws enacted by

the rulers of the church. The Quinquagesimal or Lent *fasti* was held more sacred than all the rest, though it was not yet confined to a certain number of days. But as *fasti* became more general, it was contrived to render it more easy; and therefore a more abstinence from flesh and wine was judged sufficient; a which opinion prevailed from this time, and became universal among the Latins. lib. vol. i. p. 237. 324.

The third canonical *fasti* only allows of one meal in twenty-four hours. F. Thomassin observes that the ancient *fasti* was to last without dining; i. e. only to take one meal, and that not till after noon; adding, that to dine without supping, was a breach of the *fasti*. The practice of the Latin church was to *fasti* thirty-six days in the year; which is, as it were, the fifth of the year.

Tertullian wrote an express treatise De Jejunio, of *fasti*, to support the new laws of *fasti*, which the Montanists were for imposing.

The ancient catholics allowed of no obligatory or commanded *fasti* besides that preceding Easter, since called *Lent*, the terms of which were to forbear eating till the evening.

The other *fasti* offered were only of devotion; such were the fourth and fifth feria; i. e. Wednesdays and Fridays.

This Lent *fasti* was called *statim*. Besides these, there were occasional *fasti* enjoined by the bishops, &c. See ABSTINENCE and LENT.

Some introduced the atrophy into *fasti*; that is, the use of dried fruits for their meals; and made a practice of abstaining not only from all meats and wines, but also from succulent fruits, for the whole twenty-four hours; and some reduced themselves to bread and water: but this was more than was commanded.

Fasti days are those appointed by public authority to be observed by *fasti* and humiliation. See ABSTINENCE.

Fasti ground, or *Fasti* country, a term used by some of our writers to express what others call the *fasti*.

Fastermans, or *Fasti* men, *q. d. homines habentes*, was used in our ancient customs for men in respect and substance; or rather for pledges, sureties, or bondsmen, who, according to the Saxon policy, were *fasti* bound to answer for one another's peaceable behaviour.

FASTI, in Antiquity, the Roman CALENDAR, wherein the several days of the year, with their feasts, games, and other ceremonies were expressed.

The Romans had their *græter* and *lessi* *fasti*. The *græter* *fasti* were called the *fasti* of the magistrates; and the *lessi*, the *fasti* calendar.

The *fasti* calendar, which were what was properly and primarily called *fasti*, are defined by Pegasus Pompeius to be books containing a description of the whole year; i. e. ephemerides, or diaries, distinguishing the several kinds of days, *FASTI*, *PROFESTI*, *FASTI*, *NEFASTI*, &c. The author herself was Numa; who commanded the care and direction of the *fasti* to the *pontifex maximus*, whom the people used to call and consult on every occasion. This custom held till the year of Rome 450, when C. Flavius, secretary to the pontifices, expounded in the *forum* a list of all the days wherein it was lawful to work; which was to accustom to the people, that they made him curule ædile. Lib. i. c. 26. Ed. Crevier. tom. i. p. 573.

These *lessi* *fasti*, or *fasti* calendar, were of two kinds, *urbani* and *rustici*. The *fasti* *urbani*, or *fasti* of the city, were those which obtained, or were observed in the city. Some will have them thus called because they were exposed publicly in divers parts of the city; though by the various inscriptions or gravities thereon in antique stones, one would imagine that private persons had them likewise in their houses. Ovid undertook to illustrate these *fasti* *urbani*, and comment on them in his Libri *Fastorum*, whereof we have the six first books still remaining; the six last, if ever they were written, being lost. Before Ovid, several other authors had undertaken the same subject, particularly L. Cincius Alimentarius, Publius Nubitor, Maffius Sabinus, Cornelius Labo, C. Licinianus, and Nilius; of all whom Macrobius makes mention in his Saturn, and preserves fragments of each; besides a work of one Babius Marcus, intitled, De *Fastis* *Dicibus*, quoted by Fulgentius, De *Pisico* Sermones.

In the *græter* *fasti*, or *fasti* of the magistrates, were expressed the several feasts, with every thing relating to the gods, religion, and the magistrates; the emperors, their birth-days, offices, days consecrated to them, and feasts and ceremonies established in their honour, or for their prosperity, &c.

With a number of such circumstances did history at length swell the *fasti*, when they became denominated *magis*, to distinguish them from the bare calendar, or *fasti* calendar.

In the *fasti* *rustici*, or country *fasti*, were expressed the several

several days, *feasts*, &c. to be observed by the country people; for as these were taken up in tilling the ground, fewer feasts, sacrifices, ceremonies, and holidays, were enjoined them than the inhabitants of cities; and they had also some peculiar ones not observed at Rome.

These rustic *festi* contained little more than the ceremonies of the calendar, noon, and *Idus*; the *Idus*, *Idus* of the *Idus*, increase and decrease of the days, the intercalary gods of each month, and certain directions for rural works to be performed each month.

Festus was also a chronicle or register of time, wherein the several years were denoted by the respective consuls, with the principal events that happened during their consulates; these were called also *festi consules*, or *consules festi*.

Quintus Panvinus, Pighius, Sigonius, and Jussellus d'Almondo, have given us the *festi consules*; the two first, with long and learned comments, wherein are explained not only the consuls, but also the dictators, augurs, equites, triumphs, and ovals. Pighius even adds as many of the other officers as he could find, viapretors, tribunes, &c. J. d'Almondo confines himself to the consuls alone.

Festa is still applied to the archives and public records, wherein are kept historical memoirs of public and remarkable events that have happened to a people. In the like sense the martyrology is called the *sancti festi* of the church.

The Jesuit Dr. Lancelotti has compiled the *festi* of Louis le Grand, &c.

Festus, or *fasti*, also denoted *idus* days. See *DAT*. The word *fasti*, *fastorum*, is formed of the verb *fasti*, to *fasti*, because during those days the courts were open, causes might be heard, and the praetor was allowed *fasti*, to pronounce the three words, *ne, aliter, valde*; the other days wherein this was prohibited were called *nefasti*; thus Ovid,

Ne fastus eris, per quem tria in te loquor;

Fastus eris, per quem tria loquor ego.

These *fasti* were noted in the calendar by the letter *F*; but observe, that there were some days *ex parte fasti*, partly *fasti*, partly *nefasti*; i. e. justice might be distributed at certain times of the day, and not at others. These days were called *interdies*; they were marked in the calendar thus, *F. P. Idus prima*, where justice might be demanded during the full part of that day.

FASTIDIUM *Qui*. See *NAUUA*.

FASTIGIUM *Forn*, in *Country*, furnace fitted with several stoves.

FASTIGIUM, in *Architecture*, the time with *SEDIMENT*.

FASTING *Men*. See *FASTERNAM*.

FAT, in an *Animal*, *Blas*, a white, oily, concrete substance, collected in little membranous loculi or cells in divers parts of the body, serving to keep the parts warm, to soften and temper the acids of the aliment in the mass of blood, and probably for the nourishment and reparation of the human body. It is well known that animals become lean and live upon their *fat* when they have too little food; and when they have diseases which prevent digestion and production of the nutritive juice; in which case the *fat* appears to be absorbed by the vessels designed for this use, and to be transformed into nutritive juices: it is also a fact, that the *fastest* persons falling into an atrophy, gradually lose all their *fat*, which is always quite expended in such cases before the disease escapes fatal. See *ADLEP*.

The vapours which rise from *fat*, either heated in the open air, or diffused in chole vessels, consist of acid and attenuated oil; the acid is extremely penetrating, acrid, and volatile; it irritates and inflames the eyes, throat, and lungs; and excites a cough as much as volatile sulphureous acid does, though its nature be very different, and yet in this natural state this acid is so well combined with the oily part, that none of its properties can be perceived. *Fat*, though very mild in good condition, becomes irritating and caustic when the acid is partly dissipated by fire or time. Spirit of wine, which does not affect pure and unchanged *fat*, dissolves some portion of *fat* which has been strongly heated, or which has become rancid; whence it is inferred, that the acid of the *fat* disengages itself in both these cases.

This *fat* issued immediately under the cutis, inclosed in little bags, called *culiculi adiposae*, adhering to the outer surface of the membrane, called *adiposa*, all over the body, except on the forehead, eye-lids, penis, and testum; it is holding but the oily part of the aliment or chyle which could not enter into the composition of the nutritive juices, separated from the arterial blood by the pulmonary glands, and carried by peculiar ducts to the membranous cells, whence it is transmitted again to the blood by the veins. Dr. Cullen takes it to be a *coagulum*

of the oily parts of the blood, made either by some of its own saline parts, or by the vitreous particles of the *air* mingled therewith in the lungs; which sentiment is confirmed by an experiment of that learned person, who made an artificial *fat*, by only mixing oil of olives with spirit of nitre for some days; and hence it is that divers animals, as rabbits, hares, &c. grow fat in winter, and particularly in severe frosty weather, their throats abounding most in nitre. Hence also it is that the *fat* of land animals is much finer than that of fishes, the watery element containing less nitrous matter than the air.

In some subjects the cellular *fat* is soft and diffused; that the *fat* is above an inch thick; in others they are almost *fat*; and in emaciated subjects, instead of *fat*, we find a sort of hard transparent substance, which is nothing but the bare membrane, the cells being all exhausted.

Too much *fat* is usually attended with heaviness and drowsiness, not only from the overabundance of an overgrown body, but from the stuffing of the cyvines and those alone, which sometimes obstructs the expansion of the diaphragm and lungs, and produces a dyspnoea, or an asthmia; and it is likewise probable that the abundance of *fat*, or oily particles retained in the blood, and impeding the more subtle and active parts, may hinder the necessary secretions of the brain. See *CORRUPTA*.

Mr. Huxham has the following observations on the *fat* of the body: 1. That though infants and children have much *fat* under the skin, yet they have only a small piece or two (*folioli*) at the base of the heart; whereas lean adult bodies have *fat* all round the base on the vessels that go out of the heart, and accompanying the larger coronary vessels, and at the point of the heart. 2. That the quantity of very young children has no *fat*, and their menstery very little. 3. That *fat* is not found under the skin is exhibited in the following manner.

Take a piece of the cellular *fat* from a young animal, and divide it into two parts; from which, and from the membranes, and membranes spread over it, using a needle, he concludes, the common opinion of animals being lubricated by the *fat*, to be ill founded. See *Mem. Acad. Science* 1731.

The *fat* of different animals has been represented by some writers as of considerable medicinal use; thus, *Goose fat* is used in pomatums and unguents, being resolutive and emollient. That of *bees* and *bees* has the same qualities, and is also strengthening. *Doves grease* is accounted good to fortify the nerves against the rheumatism, flatulency, goat, and fractures. *Hares grease*, applied externally, promotes digestion, and a supposition of abscesses. That of *rabbits* is nervous and resolutive. That of *cats* and *cats*, resolves and softens indurations. That of *goats* has the same qualities; and likewise abates haemorrhoids, allays pains in the ear, being applied within the famer, and opens the belly, being taken inwardly. *Eels fat* is esteemed good against the haemorrhoids and deafness, to take away pits of the small-pox, and to make the hair grow. That of the *trout*, besides its being emollient, is said to be good in diseases of the anus, and in ulcers of the breast.

But the specific virtues ascribed to certain *fat*s do not seem well warranted; some even doubt their being possessed of any properties different from other substances of like kind, unless what may arise out of their different consistencies and degrees of volatility; that of the viper seems to have the most right to claim something extraordinary upon that account. See *ADLEP*.

The way of preparing *fat* for medicinal purposes is to take out the skin, veins, fibres, &c. wash it till it becomes milky; then melt it by a gentle heat, with a little water, till the water is evaporated; strain, put it into an earthen vessel where it will sit, and preserve it from air.

FAT of *whales*. See *HERRING*.

FAT, or **VAT**, is a kind of vessel used for holding wine, ale, beer, cyder, or any other liquor, in the time of its preparation.

FAT, or **fat**, also expresses a large wooden vessel, which, among brewers and maltsters, is used to measure *MAST* for expedition, containing a quarter or eight bushels, viz. 1 Hen. V. cap. 10. and 1 Hen. VI. cap. 8.

FAT is likewise a vessel or pan of lead, used in making *fat*. See *SALT*.

FAT also denotes an uncertain measure of capacity; thus, a *fat* of singles contains from 32 hundred weight to 4 hundred weight; a *fat* of unbound books half a maul, or a bale of wire, from 20 to 35 hundred weight; and of yarn, from 220 to 231 hundred.

FATE, *Fatum*, in a general sense, denotes an inevitable necessity depending on some superior cause.

Fatales a term much used among the ancient philosophers.

It is formed a *fatus*, from *speaking*, and primarily implies the same with *fatum*, viz. a word or decree pronounced by God; or a fixed sentence, whereby the Deity has prescribed the order of things, and allotted every person what shall befall him.

The Greeks call it *ἀναγκη*, *grosq' uxor, uxor, a chain*, or necessary series of things indissolubly linked together. All things, says Plato, are in *fate*; i. e. within its sphere or science, then it is in *fate* that such things and such consequences shall ensue upon it. The soul, therefore, is *ἀερεα*, free and uncontrolled, and it lies within itself to act or not; and there is no compulsion or necessity here; but what follows upon the action shall be accomplished, *sunt uxoribus*, according to *fate*, or the constitution of things; e. g. that Paris should bear off Helen by force was something dependent on himself; but that a war should ensue is the consequence. Ex Alcino de Platon. Dogmat.

The same philosopher, as cited by Hierocles, observes to this purpose: the choice of action is in our own power; but the just award or retribution of good or ill which ensues upon the choice, lies in the breast of those eternal judges who are appointed under God.

But beside this sense of the word wherein it is used, sometimes to denote the connection of causes in nature, and sometimes in the divine appointment, the word *fate* has a farther intention, being used to express a certain necessity or external designation of things, whereby all agents, both necessary and voluntary, are swayed and directed to their ends. See NECESSITY.

Some authors divide *fate* into *astral* and *final*.

Fate astral, denotes a necessity of things and events, arising, as is supposed, from the influence and positions of the heavenly bodies, which give law both to the elements and mixed bodies, and to the wills of men.

In which sense the word is often used by Manilius, *Certum est & inevitabile fatum; materque datum est regi, sed in gere stetit*.

Fate final, or *fatality*, is defined by Cicero an order or series of causes, wherein cause being linked to cause, each produces the other; and thus all things flow from one prime cause. Chrysippus defines it a natural invariable succession of all things *ab ætate*, each involving the other.

To this *fate* they subject the very gods. Thus the poet: The Parent of all things made laws at the beginning, by which he not only binds other things, but himself. So Seneca: *Eadem necessitas & dei alligat. Irreconciliabile divina portus & humana cursum vitæ. Ipse ille emittit conditor & rector scripti quidem fata, sed sequitur: fœni scriptis, semper parat.*

This eternal series of causes the poets call *Moira* and *Parca*, or *Destiny*.

Fate is divided by some later authors into *physical* and *astral*.

Fate physical, is an order and series of natural causes appropriated to their effects.

This series is necessary, and the necessity is natural. The principle or foundation of this *fate* is nature, or the power and manner of acting which God originally gave to the several bodies, elements, mixts, &c. By this *fate* it is that fire warms bodies communicate motion to each other, the sun and moon occasion the tides, &c. and the effects of this *fate* are all the events and phenomena in the universe, except such as arise from the human will. See NATURE.

Fate divine, is what we more usually call *PROVIDENCE*. Plato in his *Phædo* includes both these in one definition, as intimating, that they were one and the same thing, actively and passively considered. Thus, *Fatum est ratio quædam divina, lingue nature comit, qua transferit nequitas, quippe a causa pendens, que superior sit quibusvis impedimentis*. Though that of Boethius seems the clearer and more just, *Fatum, says he, est inbornis rebus mobilibus dispositis, per quoniam Providentia sua quæque nititur ordinare*.

FATHER, Pater, a term of relation, denoting a person who begets a child, either male or female.

Among the ancient Romans the *fathers* of three children had very considerable privileges allowed them as such. By the law of Romulus a *father* had an absolute and unlimited power over his children. Amongst the Lacedæmonians, we learn from Aristotle's Politics, the *father* of three children was excused from the duty of mounting guard for the security of the city; and a *father* of four children was exempted from every public burden.

VOL. II. N° 126.

FATHER, adoptive, is he who takes the children of some other, and acknowledges them as his own. See ADOPTION. *FATHER, putative*, is he who is only the reputed or supposed father. Joseph was *putative father* of our Saviour. *FATHER, natural*, is he who has illegitimate children.

FATHER-IN-LAW, is a person married to a woman who has children by a former husband, &c. to which children he is said to be a *father-in-law*.

FATHER is also used in *Theology* for the first person in the TRINITY.

FATHER is also used in a figurative sense on divers moral and spiritual occasions. Thus, it is applied of the patriarchs; as we say Adam was the *father* of all mankind, Abraham the *father* of the faithful, &c.

FATHERS, in an *Ecclesiastical* Sense, denote the ancient prelates and doctors of the church.

The *fathers* assembled at the council of Nice; Chrysostom, St. Basil, &c. were Greek *fathers*, and St. Augustine, St. Ambrose, &c. were Latin *fathers*.

The appellation of *fathers* is usually confined to the theological writers of the first six centuries.

FATHERS, apostolical. See APOSTOLICAL.

FATHERS is also a title of honour given to prelates and dignitaries of the church. The right reverend father in God, lord bishop of, &c. *Ab eorum similitudine patres appellatur*.

FATHER is also applied to the superiors of Convents, &c. See ABBOT. The *father general*; *father provincial*, *provincial*; *father prior*, *sub prior*; *father definitor*, in the order of Benedictines; *father guardian*, in that of the Franciscans; *father corrector*, among the Minims, &c.

FATHERS is also applied plurally to all congregations of ecclesiastics, whether regular or secular; as the *fathers Cordeliers*, *Capuchins*, *Augustines*, *Jacobins*, &c. The *fathers Jesuits*, *fathers* of the Oratory, *Barabistes*, *Theatines* of the Mission, &c. See each under the proper article.

FATHERS of the Christian doctrine is a denomination belonging to two religious orders: one instituted in France by Cesar de Bus, and confirmed in 1597, by Clement VIII. and another in Italy founded by Columi, a Milanese knight, and established by the authority of Pius V. and Gregory XIII.

FATHERS of Samosata, or *regular clerks* of St. Marcell, is the appellation of a religious order deduced from the name of the place where their founder resided. It was first formed into a distinct society by Jerome Emilianus, a noble Venetian, and confirmed by Paul III. and Pius IV. in 1540 and 1563. Their office was the instruction of the young and ignorant, and the relief of orphans.

FATHERS is also used for persons venerable for their age or quality, or the services they have done the public.

Thus, at Rome the senators were called *conscript fathers*, *pater conscripti*, &c.

FATHER-LAP in *Ichthyology*, an English name given to a fish, called by some authors, though improperly, SCORPENA, and *scorpius marinus*. It is properly of the COTUS kind, and is named by Artedi the smooth cotus without scales, with several spines upon the head, and with the upper jaw a little longer than the under. It more resembles the small fish we call the *bull-head* or *milner*, than the *scorpaena*. The head is large and armed with spines, which it can oppose to any enemy that attacks it, by swelling out its cheeks and gill-covers to a large size. The nois and spine contiguous to the eyes are furnished with short sharp spines, and the corners of the gills are terminated by very long ones, which are strong and sharp-pointed. The mouth is large; the jaws are covered with rows of very small teeth; and the roof of the mouth is furnished with a triangular spot of minute teeth. The back is more elevated than that of others of this genus; the belly prominent; the side-line rough; the rest of the body very smooth, and growing slender towards the tail. This kind is very frequent in the Newfoundland seas, where it is called *sculpin*; and it is common on the coast of Greenland in deep water, near the shore. It is principal food of the natives, and soup made of it is said to be both agreeable and wholesome. See *Fish*, fig. 4.

FATHIMITES, or *FATHIMITES*, the descendants of Mahomet by Fathima, or Fatima his daughter.

The dynasty of *Fathimites*, i. e. of princes descending in a direct line from Ali and Fatima his wife, Mahomet's daughter, commenced in Africa in the year of the Hegira 256, or Jesus Christ 908.

The *Fathimites* afterwards conquered Egypt, and established themselves therein in quality of caliphs.

The *Fathimites* of Egypt ended with Abel, in the year of the Hegira 567, 268 years after their first establishment in Africa, and 208 years after the conquest of Egypt.

FATHOM, a long measure containing six feet, taken from the utmost extent of both arms when stretched into a right line.

The *fathom* is used at sea in estimating the length of cables and other ship-ropes, with the depths and soundings of the sea; as also in mines, quarries, wells, and works of fortification.

There are three kinds of *fashons*, accommodated to the different ranks of vessels: the first, which is that of men of war, contains six feet; the *middle*, or that of merchant-ships, five feet and a half; and the *small fashon*, used in fluyers, fly-boats, and other fishing-vessels, only five feet.

FATHOM is also used in several countries, particularly Italy, for the common yard or ell whereby things are ordinarily measured in commerce.

In this sense it is more commonly called *braccio*, or *braccia*, &c. d. arm. In Muscovy the *fathom* contains seven English feet, and about two-thirds of an inch.

FATNESS, in *Medicine*, *corpulency*, or the state of a person too much loaded with flesh and fat. See an account of a remarkable case of *fatuity* in the Med. Obs. &c. vol. iii. p. 60, &c.

FATTENING of *Colours*, among *Painters*, denotes a coagulation of the oil, which frequently happens on its being mixed with several kinds of pigments; whence, after being kept for some time, it is rendered so viscid or glutinous a consistency as to be wholly incapable of being worked with either brush or pencil. This also happens sometimes after the colours have been spread or laid on the proper ground; in which case one part of the oil will run off in small streams or drops, while the other will remain with the colours without shewing the least tendency to dry. Oils likewise will *fatten* by long keeping, or by being exposed for a considerable time to the sun and air.

FATTENING of *herbs*. See **HORTUS**.

FATUARI, in *Antiquity*, were persons who, appearing inspired, foretold things to come.

The word is formed of *Fatus*, wife of the god Faunus, who was supposed to inspire women with the knowledge of futurity, as Faunus himself did the men. *Fatus* had her name from *fari*, q. d. *cutinari*, i. *prophecy*.

FATIUS *levis*. See **IGNIS FATIUS**.

FAUCON, or **FALCON**, a name formerly given to a small piece of cannon, whose diameter was 2½ inches; weight 750 pounds; length, 7 feet; load, 2½ pound; shot, 2½ inches diameter; and 2½ pound weight. See **CANNON** and **GUN**.

FAUCONET, or **FALCONET**, a very small piece of ordnance, whose diameter at the base was 1½ inches; weight, 400 pounds; length, 6 feet; load, 1 pound; shot, something more than two inches diameter, and 1½ pound weight. See **ORDNANCE** and **GUN**.

FAVIFORMA, in *Surgery*, a term used to express certain ulcers, which, when pressed upon with the finger, emit a *faucus* through several small holes in the manner in which honey, on pressing the comb, issues out of the cells.

FAVILLA, *Salis*, in *Natural History*, a name given by Vitruvius and some of the more ancient writers to the natrum or nitre of the ancients. Our chemical writers, who have been used to delight much in hard names, have applied the same phrase to express our nitre; but this is a very different salt from the other.

FAVILLA, among *Antiquaries*, a hole, pit, or vault, underground, wherein is kept something of great value. The word *favos* formed of *favilla*, a diminutive of *fovea*, a pit or ditch.

The *favilla*, according to A. Gellius and Varro, was much the same with what the ancient Greeks and Romans called *thysanus*, *thysanus*, and what in some of the modern churches is called *archais* and *crisary*. In the Capitol there were divers *favilla*. They were subterraneous places, walled and vaulted, having no entrance or light but by a hole at the top, which was usually hopped up with a huge stone.

They were chiefly designed for keeping the old worn statues and other ancient moveables formerly used in the temple; so religiously did that people respect and preserve whatever was consecrated. Catullus would have lowered the floor of the Capitol, but that the *favilla* prevented him.

Favina, however, gives us a different account of the *favilla*. According to that author they were wells or pits of water near the temples, and for the use thereof, the same with what the Greeks call *oceanas*, wells, as being round, &c. Gellius likewise gives them the name of *cisternae*, as well as *Favina*; but it is apparently for no other reason than that they bore a resemblance to them in figure.

In effect, the two notions are pretty easily reconciled. It being certain that the treasures of some of the ancient Greek temples were the cisterns or reservoirs of water wherein people used to wash themselves before they entered the temple.

FAUNALIA, in *Antiquity*, feasts celebrated by the Romans in honour of the god Faunus.

The deity Faunus, to whom the solemnity was devoted, and from whom it was denominated, was the same among the Romans with the Pan of the Greeks.

The *Favalia* were held on the day of the nones of December; i. e. on the fifth day of that month. The principal sacrifice was a roe-huck; or rather, according to Horace, a kid, attended with libations of wine, and burning of incense.

It was properly a country festival, being performed in the fields and villages with peculiar joy and devotion. Horace gives us a very gay description thereof in the eighteenth ode of his third book:

— *Tener plover soliti huc dat anus:*

Longe me desunt Veneris fidioli

Vina caterva: cuncti ara multo

Famat idcirco.

Strabon in his Roman calendar marks the feast of Faunus on the day of the ides of February, which is the thirteenth day of that month; and the *Favalia* he places on the fifth of the ides of December, or the ninth of that month; and in chap. ix. he shows, that there really were two *Favalia*, the one in February, mentioned by Ovid, Fast. lib. vi. ver. 246. the other on the ninth of December, mentioned by Horace, in the place just cited.

FAUNS, **FAUNI**, among the ancients, were a species of demi-gods inhabiting the forests; called also *Sylvanæ*, *Sylvani*, and little differing from the *SATYR*. They delighted more particularly in vineyards, and they generally appear as attendants of Bacchus, in the representations of Bacchanal feasts and processions. They were represented as half men, half goats, having the horns, ears, feet, and tail of a goat, a very flat nose, and the rest human.

The Roman *Faunus*, we have observed, was the same with the Greek Pan. Now, in the poem we have just mentioned, mention made of *Fauni* and *Panes* goes to the same point, in all probability, therefore, the *Fauni* were the same with the *PANES*.

Though the *Fauni* were held for demi-gods, yet they were supposed to die after a long life. Arnobius throws that their father or chief, Faunus himself, only lived 120 years.

FAVONIUS, among the Romans, the wind which blew directly from the west.

FAVORITO, in the *Italian Music*, is an epithet given to such parts of any composition as are performed to the greatest advantage. Thus, *choro favorito* is a chorus in which are employed the best voices and instruments to sing the recitatives, play the ritornelles, &c. This is otherwise called the *little chorus*, or *choro ristretto*.

FAVOUR, in *Commerce. See **DARS** of *Greeks*.*

FAUSSE-BRAYE, in *Fortification*, an elevation of earth, about three feet above the level ground; round the foot of the rampart on the outside, defended by a parapet about four or five fathoms distant from the upper parapet, which parts it from the berm, and the edge of the ditch; its use is for the defence of the ditch. The *fausse-braye* is the same with what is otherwise called *chemin des rondeurs*, and *traversements*.

It is of little use where ramparts are faced with wall, because of the rubbish which the cannon beats down into it; for this reason engineers will have none before the faces of the bastions where the breach is commonly made, because the ruins falling, the *fausse-braye* makes the ascent to the breach the easier; besides, that which flies from the face often kills the soldiers placed to defend it.

For these reasons it is generally disused by modern engineers, more especially since the invention of ricochetting, which renders it extremely easy to enfilade the low works of the *fausse-braye* from one side to the other.

FAUSSE chenille, in *Natural History*, a term used by Mr. Resumier and other of the French writers to express a large class of worms produced from the eggs of several species of four-winged flies. These worms have greatly the appearance of caterpillars in their general form, so that they have deceived many writers on insects into an opinion that they really were so. Their bodies are long, in the manner of the caterpillar, and they are composed of several rings or joints; the skin is of the same consistency with that of the caterpillars; and in many species the cuticle is variegated with beautiful colours, disposed in the same manner as those of the smooth caterpillars usually are. Both these kinds of insects have a great number of legs, and those of two kinds some membranaceous, and others feely. Both the worm and the caterpillar have each six of the feely legs; but the membranaceous ones are different in number, and are alone sufficient to constitute a difference between them. The caterpillars have never more than ten of these, which

with the fealy ones, make sixteen, the utmost number of the legs of any caterpillars: but these worms have always at least twelve of the latter kind of legs, which, with the six fealy ones, make the whole number eighteen; and many species have fourteen, sixteen, or eighteen of the membranaceous ones alone. The membranaceous legs of the worms differ also from those of the grainy caterpillars, in that they are not furnished with the hooks at their ends, which those of the latter have. The legs therefore alone give a sufficient basis of distinction between the caterpillar and the *faust cheville*, or caterpillar worm; but there is yet a more obvious distinction between them in the shape of their heads; and by this they may always be known from each other at first sight. The heads of the various species of caterpillars are of several very different shapes: some are short, others long; some more, some less, flattened; and some terminate in a sharp point, while others are distinguished by a sort of slit or division in the back-part. These differences are found in the several kinds of the genuine caterpillars; but the heads of all the *faust chevilles* are of one shape, and that very different from all these; they are round and very convex, so that they appear as part of a small sphere. The mouths of these, and of the genuine caterpillars are wholly alike, and the ligaments are placed in the same manner. The eyes, however, of the two kinds sufficiently distinguish them, the *faust chevilles* having only two, and those very large, and prominent, and placed on each side of the head; whereas the caterpillar has five eyes on each side of its head, and those placed in a circular direction, and too small to be seen without the assistance of glasses.

These creatures differ from the common caterpillars in their manner of remaining on the leaves of a plant: the caterpillar is always extended at its full length, whether it is eating or not; but the *faust chevilles*, though it extends its body to the full length while eating, always rolls it up into a spiral when at rest, making several circular turns with it, so that the head is at the end of the outermost, and the tail in the very centre of the inner one. They give themselves various odd contortions when they are feeding on their food; and it is a very whimsical sight to observe twenty or thirty of them in those kinds which live in society attacking the different portions of the same leaf all at once, and each giving its body some odd turn at the same time. This is a common sight on the leaves of the osier, a whitish green kind being very frequent in large companies on that tree, and often seen thus feeding in coveys. It is remarkable that as the caterpillar feeds indifferently on every part of the leaf, this animal usually attacks only the edges.

The creature, when it finds the time of its change into the nymph state approaching, gives it self the trouble of forming a case in which it may pass into that state, and remain in it during the destined time without being subject to external injuries: it spins a web of silk for this purpose of the shape of a little egg. This on the outside shews nothing remarkable; but when cut open, it is found to be composed of two different substances, at least of two substances of very different workmanship, though the materials are the same in both. The outer case is reticulated, and formed of very strong threads woven in loose open net-work; but the inner one is formed of extremely fine threads, and those woven into a closer stuff than all that the loom can come up to. The outer strong and coarse web was plainly intended for no other purpose but for the better defending and preserving them from injuries; and these two distinct cases do not in any where adhere to one another but barely touch; so that on pulling asunder the outer one between the fingers the inner one comes out whole. The strength of this exterior shell is extremely necessary, as also the close texture of the inner one for defending the inclosed animal in the nymph state from several devouring insects. The ants in particular are very fond of these nymphs, and will hunt out the cases wherever they are to be found; and if they can cut their way through them, are sure to make a meal of the inclosed creature.

The flies produced from these insects are of that kind which have no trunk, but have a strong tooth on each side of the head, which meeting one with the other in the middle of the mouth, are able to cut any thing to pieces that the creature has occasion to make its way through. The first use of these is the eating of a hole through the double web, in which the creature finds itself inclosed at its birth. All the flies of this kind have a general resemblance one to another, and may be known to belong to the same family, though they are very different in colour and other obvious characters. They are never very handsome, and are all as it were stupid, having very little motion, and standing readily at any time to be caught between the fingers. Their wings always are crossed over the body, and form a sort of raised covering over it; they are not

smooth and even as those of most other flies, but have prominences and cavities, and seem as if they had been but ill expanded at the time of the creature's hatching from the nymph state. Reaumur's Hist. In. vol. ix. p. 133. All the females of these flies are oviparous, no one species producing living worms; and as these eggs must necessarily be lodged in cavities or niches made in the stalks or leaves of living plants, nature has provided this creature with two instruments which are defined for this sole purpose, and which are real saws made in the nicest manner, with extremely small teeth. The creature has the power of using both these at once, and consequently can make an aperture with great ease that shall be sufficient to lodge its eggs in. Notwithstanding that there are many different species of flies which have this sort of instrument, and several of them are extremely frequent on one of the most common of all our garden shrubs, the rose-tree; yet no author had observed this elegant and wonderful instrument till the time of Vallinier, who has described and figured at length the weapons of a rose-tree fly, produced from a false caterpillar of that shrub, with two rows of teeth, one on each side in the manner of the saw of the *sera piffi*, or *java-fly*. See ROSE-fly.

FAYUS, in Surgery. See ACHOR and TINKA.

FAX-BOURDON, *kyrd hantcher*, a name given by Reaumur and other French naturalists to the bees usually called by us drones, and by the common people of that nation burdens, confounding them with the common humble-bee under that name. See DRONE.

FAX PUCERON, in Natural History, a name given by Reaumur and others to a genus of insects much resembling the *puerons* in many things but differing in some material circumstances. The two principal kinds of these are found on the back of the leaves of the fig-tree, and in little hollow balls at the summits of the branches of box, formed of the upper leaves visited by the bitings of these creatures. See FIG INFEST and GRUB of the box.

To FAY, in Ship-building, is to fit any two pieces of wood so as to join close together; the plank is said to *lay to* the timbers when it bears or lies close to all the timbers.

FAWN, among Hunters, is a buck or doe of the first year, or the young one of the buck's breed in its first year.

FEAL was anciently used for faithful, hence the tenants by knights service used to swear to their lords to be *feal and true*; that is, *faithful and loyal*.

FEALTY, an oath taken at the admittance of every tenant, to be true to his lord, while he holds his land.

Fauly is usually mentioned as synonymous with homage; but it differs from it, as homage consists in taking an oath when the tenant comes to his land, and is done but once, being an obligation which is permanent, and binds for ever, which *fauly* does not.

They differ also in the manner of the solemnity; for the oath of homage is taken by the tenant kneeling, but that of *fauly* is taken standing, and includes six things, which are comprised in the words *invalens, tutum, utile, benivolus, facis, possidit*.

Invalens, that he do no bodily injury to the lord; *tutum*, that he do him no secret injury in any thing which is for his defence, as in his house or castle; *benivolus*, that he do him no injury in his reputation; *utile*, that he do not damage him in his possessions; *facis* and *possidit*, that he make it easy and not difficult for the lord to do any good which otherwise he might do: all which is likewise comprised in Leg. Hen. I. cap. 5.

He that holds land by this only oath of *fauly*, holds in the freest manner; for all, even those that have a fee, hold per *feum et fiduciam*; that is, by *fauly* at the least.

This *fauly* is also used in other nations, as in Lombardy and Burgundy.

Indeed, as the very first creation of this tenure grew from the love of the lord towards his followers, so did it bind the tenant to fidelity, as appears by the whole course of the feuds, and the branch thereof is his of the fee. Hottoman, in his *Commentaries de Verbis Feudalibus*, shews a double *fauly*, the one general, to be performed by every subject to his prince, answering to our oath of ALLEGIANCE; and the other special, required only of such, as in respect of their fee are tied by this oath towards their lords. We read of both also in the Grand Customary of Normandy, &c.

Fauly special was with us performed either by freemen or vassals. By 17 Ed. II. stat. 2. the form of this oath is appointed, and as now observed it is as follows: "I A. B. will be to you my lord C. true and faithful, and bear to you *fauly* and faith for the lands and tenements which I hold of you; and I will truly do and perform the customs and services that I ought to do to you. So help me God." The oath is administered by the lord or his steward; and though it is neglected in some manors, yet in copy-hold manors, where courts are kept, and copy-hold estate granted, it is generally used.

Every

Every lord, of whom tenements are holden at this day, may, and ought to call upon his tenants to take this oath in his court-baron, because if it be long neglected he may lose his feignory, and the profits arising from escheats and other contingencies.

Festy is incident to all sorts of tenures, except from frank-almoyn and tenancy at will.

FEAR, in *Etruria*, is the apprehension of some evil likely to befall us, attended with a desire of avoiding it. This passion has been found to lessen **PERKINIZATION** and urine.

FEAST, or **FESTIVAL**, a church solemnity, or rejoicing in honour of God or a saint.

The word is formed of the Latin, *festum*, which some derive *a feriari*, *to keep holiday*; others from the Greek, *εἶναι*, *I feast on interior*, of *εἶναι*, *to eat*, *first*.

Festis, and the ceremonies thereof, have made great part of the religion of almost all nations and sects; witness those of the Greeks, Romans, Hebrews, Christians, and Mahomedans. *Fests* among us are either *immovable* or *movable*.

FEASTS, *immovable*, are those constantly celebrated on the same day of the year; the principal of these are Christmas-day, or the Nativity; the Circumcision, Epiphany, Candlemas, or the Purification; Lady-day, or the Annunciation, called also the Incarnation and Conception of All Saints, and All Souls; besides the days of the several apostles, St. Thomas, St. Paul, &c. which with us are *feasts*, though not *feries*. See each *feast* under its proper article.

FEASTS, *movable*, are those which are not confined to the same day of the year. Of these the principal is Easter, which gives law to all the rest, all of them following, and keeping their proper distances from it; such are Palm Sunday, Good-Friday, Ash-Wednesday, Sexagesima, Ascension-day, Pentecost, and Trinity-Sunday. See **EASTER**, **SEXAGESIMA**, **PENTECOST**, **TRINITY**, &c.

The four *feasts* which our laws take special notice of are the Annunciation of the Blessed Virgin Mary, or Lady-day, the 25th of March; the Nativity of St. John the Baptist, held on the 24th of June; the *Feast* of St. Michael the Archangel, on the 29th of September; and that of St. Thomas the Apostle, on the 21st of December: on which quarterly days rent on leases is usually referred to be paid, 6 Ed. VI. cap. 3. 3 Jac. I. cap. 1. 12 Car. II. cap. 30.

Beside these *feasts* which are *general*, and enjoined by the church, there are others *local* and *accidental*, enjoined by the magistrate, or voluntarily set on foot by the people; such are the days of thanksgiving for deliverance from wars, plagues, &c. Such also are the vigils or wakes in commemoration of the dedications of particular churches. See **VIGIL**, &c.

The prodigious increase of *feast-days* in the Christian church commenced towards the close of the fourth century, and was occasioned by the discovery that was then made of the remains of martyrs and other holy men, for the commemoration of whom they were established. These, instead of being set apart for pious exercises, were abused in indolence, voluptuousness, and criminal practices. Many of them were instituted on a pagan model, and perverted to similar purposes.

The first *feasts* among the Greeks were celebrated in solemn assemblies of the whole nation, on occasion of their games, as the Olympic, the Pythian, the Isthmian, and Nemean; in process of time they had many others, the principal of which are enumerated in the course of this work. See **POTTER'S APOC.** vol. i. cap. 19, 20.

The Romans also had abundance of fixed *feasts* in honour of their deities and heroes; such were the Saturnalia, Cerealia, Lupercalia, Liberalia, Neptunalia, Consualia, Portunalia, Vulcanalia, Falis, Divalia, &c. See **SATURNALIA**, &c.

They had also *feasts* instituted occasionally; as Carmenalia, Quirinalia, Terminalia, Floralia, Compitalia, Lemuria, Veneralia, besides other movable and occasional ones; as to give thanks to the gods for benefits received; to implore their assistance, or to appease their wrath, &c. as the Paganalia, Feralia, Bechebanalia, Ambrosalia, Ambrosalia, Surrentanalia, and divers others, particularly denominated *feria*, as Senectutina, Latina, &c. See each of these *feasts* and *ferie* in its proper place.

The *feasts* were divided into days of sacrifice, and days of banqueting and feasting; days of games, and days of rest, or *ferie*.

There being but little history wrote, or at least published in those days; one end of *feasts* was to keep up the remembrance of past occurrences.

The principal *feasts* of the Jews were the *feasts* of trumpets, that of the expiation, of tabernacles, of the dedication, of the passover, of pentecost, and that of purification.

The modern Jews have other *feasts* marked in their calendar of modern institution. The Mahometans, besides their weekly *feast*, or sabbath, which is kept on Friday, have two solemn *feasts*, the first of which is called the *Feast* of Victims, and celebrated on the tenth day of the last month of their year; and the second called **BAYRAM**. The Chinese have two solemn *feasts* in the year, in memory of Confucius, besides others of less note on other days of the year.

FEAST of the dead, is a solemn religious ceremony in use among the savages of America, some of whom thus testify their respect for the deceased every eight years; and others, as the Hurons and Iroquois, every ten years.

FEAST is also used for a banquet, or a sumptuous meal, without any immediate view to religion.

The use of the word, in this sense, arises hence; that a part of the ceremony of many of the ancient festivals, both those of the Heathens and the *apostles* of the Christians was good eating; though Mr. Huet chooses to derive the word from *festuarius*, which, in an ancient Latin version of Origen's Comment on Matthew, signifies *to feast*: *Et unum est festu festum canit deus*, *festu*, *festu*. In all antiquity, both sacred and profane, sacrifices were little more than religious *feasts*.

It has been often observed by authors, that there is no nation in the world comes near the English in the magnificence of their *feasts*. Those made at our coronations, installments, consecrations, &c. transcend the belief of all foreigners; and yet it is doubted whether those now in use are comparable to those of our forefathers.

The Persians never discourse and deliberate of their most important affairs but in the middle of their *feasts*.

FEATHER, *Plume*, that part in birds which covers them, and by which they are enabled to fly.

Feathers make a considerable article in commerce, particularly those of the ostrich, heron, swan, peacock, &c. for plumes, ornaments of the head, &c. of birds, writing-pens, &c.

Geese are plucked in the month of Great Britain three times in the year; the first plucking is at *feast-days*, *feathers* and *quills*, and the same is repeated on *feathers* only four times in the year, and at Michaelmas. See **FEW** and **GEOW**. It would reason many geese die by this barbarous custom. Those *feathers* that are brought from Somersetshire are esteemed the best, and those from Ireland the worst. Eider down is imported into this country from Denmark, and is furnished by those ducks that are inhabitants of Holford's Bay, Greenland, Iceland, and Norway. Hudson's Bay also affords a very fine *feather*, supposed to be of the goose-kind. The down of the swan is brought from Dantzick, whence we have also a great quantity of cock and hen *feathers*. The best method of curing *feathers* is to lay them in a room in an exposure to the sun, and when dried to put them in bags, and beat them well with poles to discharge the duff.

Feathers seems to be only productions and expansions of the last extreme fineness of the curls; and hence, upon stripping off the curls, the *feathers* are likewise always taken away; just as the leaves and fruit follow, upon peeling the bark of a tree: add, that *feathers* as well as hairs arise out of pores in the curls; which pores are not mere apertures or foramina, but a kind of vaginule, were of the fibres of the skin, which terminate in theacula or anatomies of the internal fibres of the feather.

Feathers, Dr. Deyham observes, are a very commodious dress for the inhabitants of the air, being not only a guard against wet and cold, and a means for hatching and brooding their young, but most commodious for flight; to which purpose they are nicely placed over the body to give an easy passage, and every where neatly posited from the head towards the tail in close uniform order; so that being pruned and dressed by an unctuous matter secreted in a proper gland, and deposited in an oil-bag placed therein for that purpose, they afford as easy a passage through the air as a boat new cleaned and dressed has through the waters. Without all this nicety they would have been apt to be ruffled and discomposed, and would have gathered air, and proved an obstruction to the passage of the body.

Most of the *feathers* tend backwards, and are laid over each other in an exact method, armed with a warm and soft down next the body, and more strongly made, as well as more curiously closed next the air and weather; to which purpose the apparatus nature has made, and the instinct she has given them to prune or dress their *feathers*, are admirable.

The mechanism of the feather is wonderful; the shaft or rib is exceeding strong, but hollow below, for strength and lightness sake; and above, not much less strong, and filled with a *parachyma* or pith both strong and light.

But the vane, or web, in the flag-part of the wing are nicely gaged, broad on one side, and narrower on the other.

other, the edges of the exterior vanes bending downwards, and those of the interior or wider upwards; by which means they catch hold and lie close to each other when the wing is spread, so that not one feather may miss its full force and impulse upon the air: the tips are all made sloping; those of the interior vanes lying to a point towards the outer-part of the wing, and the exterior vanes towards the body; so that the wing, whether extended or shut, is as neatly sloped and formed as if constantly trimmed with a pair of scissors.

Dr. DeLion has several new observations on the mechanism of the vane or web of the feather as they present themselves to the microscope, by which the wonderful care and accuracy of the Creator in so small a part are excellently illustrated.

The vane consists not of one continued membrane (because, if once broken, it would then be scarce reparable), but of many laminae, admirably contrived to hook and hang together. On the under-side they are thin and smooth; but on their upper outer edge, (represented *Tab. Nat. Hist. fig. 3.*) they are parted into two hairy edges, each side having a different sort of hairs, laminated or broader at the bottom, and slenderer and bearded towards the tip. These bearded hairs on one side of the lamina have straight hairs, as represented in *fig. 4.* those on the other have hooked beads on one side of the slender part of the bearded hairs and straight ones on the other, as in *fig. 5.* Both kinds are represented as they grow on the upper edge of the lamina in *fig. 2.* In the vane, the hooked beads of one lamina always lie next the straight beads of the next lamina, by which means they lock and lay hold on each other, and by a pretty mechanism brace the laminae close to one another.

FEATHER, *see* *Feather*.

FEATHERS, *see* *Feather*. See *Feather*.

FEATHER, *see* *Feather*.

FEATHER, *see* *Feather*. *Feather*, are those which are thicker on one side than on the other.

FEATHER, in the *Feather*, is a sort of natural frizzling of the hair found in many parts of a horse's body, but more commonly between the eyes. In some cases it resembles an ear of barley, and in others an owl's foot. Many are of opinion, that when the feather is lower than the eye it is a sign of a weak eye-light; but this remark is not certain.

FEATHER, *prince*, in *Italy*. See *AMARANTH*.

FEATHER, *Roman*, called in French *eye Romaine*, is a feather upon a horse's neck, being a row of hair turned back and tailed, which forms a mark like a sword-blade just by the mane.

FEATHER, *mid*, in the *English Salt work*. See *Mid*.

FEATHER, *see* *Feather*. See *Feather*.

FEAZING, at *Sea*, is the raveling out of the cable or any great rope at the end.

FEBRIFUGE, in *Medicine*, a remedy efficacious for the cure of *FEVER*.

The word is a compound of *febris* and *fuge*. *Febris* away. The quinquina, or Jesuit's bark, is the greatest and surest of all the class of *febrifuges*.

The little centaury is sometimes also called *febrifugum*, on account of its virtue.

The Chinese ginseng is also particularly famed as a *febrifuge*. For such as cannot take the Peruvian bark in substance, Dr. Feller prescribes a *febrifuge* elixir, made of a decoction thereof. The inner bark of the ash-tree, with a little salt of wormwood, when like the Peruvian bark, is laid to equal, or even exceed it, as a *febrifuge*. The like is asserted of the bark of the elm, near the root.

The flowers of *sol. arvensis* are held in excellent *febrifuge*, especially in intermitting fevers. Cold water has been much extolled as a *febrifuge*. Dr. Handcock gives it the emphatical denomination of *febrifugum magnum*.

M. Rencureau, in the *Hist. de l'Acad. R. Sciences*, viz. 1711, proposes a new *febrifuge* of his own discovery, viz. galls. From a great number of experiments he has learnt, that galls alone will frequently cure an intermitting fever as well as the quinquina, over which this medicine has some advantage in other things, in that it is not so bitter, does not heat so much, is taken in a lesser dose, and is cheaper. At his motion several other physicians tried it with success, particularly M. Homberg, though it did not succeed so well with M. Boulduc, Lemer, and Gendroy. If the flowers of antimony, made with sal ammoniacum and antimony sublimated together, are exposed to the air, they produce a liquid called *febrifuge oil*. The Germans call the pulvis *typti*. Hells the *febrifuge powder* and the same name is given in England to a mixture of oak, cedar, c. &c. and tart. emet. &c. ii. This is administered in doses of gr. iij. to vi. The *febrifuge salt* is the sal. arin. regem.

Vol. II. No. 120.

The *febrifuge* spirit of Mr. Clutton is prepared by digesting together for a month equal parts of oil of sulphur by the bell, rectified oil of vitriol and spirit of salt, with three times the whole quantity of rectified spirit of wine, and distilling them to dryness. This spirit mixed with water, so as to render it agreeably acid, is given with common drink in ardent and inflammatory fevers, and with any cordial or antiseptic liquors in the nervous and putrid kinds.

FEBRIS, in *Medicine*. See *FEVER*.

FEBRIS, *ephemera*. See *EPHEMERA*.

FEBRIS, *intermittens*. See *INTERMITTENS*.

FEBRUA, or FEBRUARIA, in *Mythology*, an appellation given to Juno as the goddess of purification, and as presiding over women in the pains of labour and child-birth.

FEBRUA, in *Antiquity*, a feast held by the Romans in the month of February, in honour of the MANES of the deceased. Macrobius tells us that sacrifices were here performed, and the last offerings paid to the shades of the deceased. Saturn. lib. I. cap. 13. And from this feast it was that the month of February took its name.

The design of these sacrifices is somewhat controverted: Pliny says they were performed to render the infernal gods propitious to the deceased, though some of the moderns have imagined that they were intended to appease the deceased themselves, and were offered immediately to them as a sort of delict. What confirms the former sentiment is, that Plato himself is furnished *Februa*. They lasted twelve days.

The word is of an ancient standing in the Latin tongue; from the very foundation of the city we meet with *fecus* for purification, and *februa*, in *fecus* or *purificatio*. Vossius, De Ling. lib. v. derives it from the Sabine; *Vofus*, and others, from *fecus*. I am led, because purifications were chiefly performed with fire and hot water. Some go higher, and even deduce the words from *FE*, *plur.* or *pluvius*, which, in the Syriac and Arabic, has the same signification with *febris*, or *febrilis*, and might probably likewise signify *purificatio*; for *pluvius*, in Arabic, denotes a preparation given to women in child-birth to bring away the after-birth, and other impurities remaining after delivery, much as among the Romans, who gave the name *Februa* to the goddess supposed to preside over the delivery of women. Ovid. Fast.

FEBRUARY, *Februarius*, in the Roman Chronology, the second month of their year, so called from *Februa*, a feast held therein.

In the first ages of Rome, February was the last month of the year, and preceded January, till the decemviri made an order that February should be the second month of the year, and come after January. See *BIBLICAL*.

FECES. See *FACES*.

FECIALES, or PORCIALES, an order of priests or officers, consisting of twenty persons, among the ancient Romans, appointed to proclaim war, negotiate peace, &c.

Festus derives the word from *fecis*, *fecis*, as *fecis* *fecis* signifies to conclude a treaty; and accordingly, instead of *feciales* he would have it wrote *feciales*. Others derive it from *fecis*, which was anciently written *fecis* or from *fecis*, *fecis*; others from *fecis*, *fecis*, *fecis*, &c. because they made war and peace. Vossius chooses to derive it from *fecis*, of the verb *fecis*, *fecis*, in which sense the *feciales* should be the same with *feciales*; which sentiment is also confirmed by the authority of Varro, who says they were called indifferently, *feciales* and *feciales*. De Vir. Popul. Roman. lib. ii.

The *feciales* were a sort of heralds or kings at arms, who, when the Romans had any dispute with their neighbours, were sent first to demand that thing pretended to be unjust, or require satisfaction for the injury alleged to be done. If an answer was not returned by them that was satisfactory to the people and the senate, they were dispatched again to declare war, and the like in treating of peace, the *feciales* being the only persons appointed to negotiate between the nation, &c. and the enemy.

Plutarch, in the Life of Numa, and Hæcæmæus, lib. ii. observe, that they were first instituted by that prince. The latter adds, that they were chosen out of the best families in Rome; that their office, which was reputed a sort of sacerdotium, or priesthood, only ended with their life; that their persons were sacred and inviolable, as those of other priests; that they were even charged to see the republic did not declare war unjustly; that they were to receive the complaints and remonstrances of nations who pretended to have been in any way injured by the Romans; that if those complaints were found just, they were to seize the criminals, and deliver them up to those they had offended; that they were invested with the rights and privileges of ambassadors; that they concluded treaties of peace and alliance, and took care they were executed; and lastly, abolished them, if they found

found not to be equitable. Livy, lib. i. cap. 24. ascribes their institution to Ancus Marcius, in the year of Rome 114. See also Aul. Gell. lib. xvi. cap. 2.

But Varro assures us, that in his time most of these functions of the *fasces* were set aside; as those of the ancient heralds at arms are among us at present; though Plutarch observes, that they had still some authority in his time.

The *fasces* were crowned with *verruca*, warts, when they went to declare war; their head was covered with a veil, over which the crown was applied; in this equipage they proceeded to the frontiers of the new enemy's country, and threw a bloody dart or javelin into the ground within the same. In Livy, and other ancient authors, we have the formula used in such declarations.

FECULA, or **FACULA**, in *Phloem*, is a white mealy substance or powder which subsides and gathers at the bottom of the expressed juices of divers roots, as those of hony, arum, iris, &c.

The word *fecula* is a diminutive of *feces*.

This substance or sediment they dry in the sun, after having poured off the liquors, and it serves for divers remedies, &c.

FECULENT, or **FECULENT**, is applied to the blood and other humours, when they abound in *feces* or *diets*, or have not the proper and usual degree of purity.

FECUNDITY, or **FEROCITY**, *fertilitas*, or that quality of a thing which denominated it fruitful.

The fecundity of divers plants is very extraordinary. M. DuRoi has an explicit discourse on this subject, in the Memoirs of the Academy of Sciences, wherein he shews, that at a moderate computation, an elm one year with another, yields 320,000 grains of seeds, each of which, if properly sowed, would grow up into a tree: now, an elm ordinarily lives 100 years, consequently, in the course of its life it produces near 32,000,000 seeds, all which arise from one single seed.

He shews farther, that the same elm by frequently cutting off its head, &c. might be brought to produce 15,840,000,000 seeds, and consequently that there are to many actually contained in it.

FECUNDITY of fish. See *FISH*.

FEDOA, in *Zwamy*, a name used by Gesner and some other authors for the *godwit*, more commonly called *MOCCIPHALUS*. See *VEROLA*.

FEE, **FEEU**, **FEEUDUM**, **FEEUDUM**, or **FIEF**, an estate, land, tenement, lordship, or the like, held of a superior lord, on condition of fealty, homage, or other acknowledgment.

The word is derived by some authors from *feodum*, as arising from a treaty or alliance made with the lord; but the opinion of Selden seems the best authorized, who brings it from the Saxon, *feoh*, *spendium*, the *fee* being a kind of prebend to live upon; and accordingly we find, that in ancient times it was used for the wages and appointments of officers. It is observed by Pontoppidan, in his History of Norway, that in the Northern languages *vel*, signifies property, and therefore *feudal*, or *feudum*, will denote *feudary* property.

The term *fee* is properly applied to lands and tenements, which we hold in perpetual right, on condition of an acknowledgment of superiority in a higher lord. See *TENURE*.

The writers on this subject divide all lands and tenements wherein a man has a perpetual estate to him and his heirs into *ALLODIUM* and *FEEUDUM*.

Allodium is defined to be a man's own land, which he possesses merely in his own right, without acknowledgment of any service or payment of any rent to another; and this is property in the highest degree.

Feudum is that which we hold by the benefit of another, and for which we do service or pay rent, or both to the chief lord.

Originally a *feud* was only an estate for life; and those to whom it was granted were called *vassalli*, who by such means were brought to a stricter discipline and obedience to the prince, and were bound to serve them in wars.

The origin of *fee* or *feud* is one of the darkest and most intricate points in modern history. Some attribute the invention to the Lombards. Sir Thomas Craig inclines to this opinion, and says, that the Lombards, after they were subdued by Charlemaigne, not only retained their ancient customs, but at the return of that emperor into France transmitted them with him into the remotest parts of that kingdom. In reality, the constitution of *feud* had its original from the military policy of the Northern or Celtic nations, the Gosh, Huns, Franks, Vandals, and Lombards, who spread themselves over Europe at the declension of the Roman empire. This is rendered probable by the demand which the Cimbric and Teutonic nations of the same original, are recorded to have made on the Romans on their first irruption into

Italy, about a century before the Christian era. They demanded of the Romans, *Ut martius populus sibi fidei tercia daret, quod stipendium; ceterum, a vassallo munus atque arma sui iuraret*; i. e. they desired *feud* to be allowed them, which they were to hold by military and other personal services. L. Florus, lib. iii. cap. 3. Having brought this constitution from their own countries, they continued it in their respective colonies as the most likely means to secure their new acquisitions; and for this purpose the victorious general allotted large districts of land to the superior officers of the army; and these again distributed smaller parcels to the inferior officers and more deserving soldiers. However, the *feudal* policy was only brought by degrees into that state, which we find established in the empire under Constantine the Great, and in France under Hugh Capet. Sir Thomas Craig has distinguished four states of the *feudal* law; its infancy, comprehending the period between the first overthrow of the Northern nations and the year 650; its childhood, the time in which *feud*, which were before annual, or at most for life, were extended to the sons of the vassal, and so farther, viz. from the year 650 to the year 800, when Charlemaigne was crowned emperor; its adolescence, from the times of Charlemaigne to those of Conrad II. or the Salic, who began his reign in the year 1024, and now only confirmed the inheritance of *feud* to the sons and grandsons of the vassal, but permitted one brother to succeed another in his paternal estate; but even after the alteration made by Conrad, it was not uncommon in Germany to grant *feud* only for life; a charter of this kind occurs as late as the year 1276; and its maturity from this period forward, when *feud* were permitted to descend to collateral as far as the seventh degree. Others find some appearance of the duties of a vassal to his lord, in the ancient relations between the patron and his client; and others trace its rise in the Roman Republic.

The emperors, it seems, by degrees, among the ancient legions on the frontiers, by giving them lands ready at all times and in all places, to defend the frontiers of the empire, with a view to a good image enough of *feud*, thought of introducing their first origin should be traced higher, to the projects of time their nature was changed, and those were annexed to them which originally were not.

Du-Moulin makes no doubt, but that these distributions of land, called *beneficia*, were the first matter of *feud*; for which reason he uses the terms *benefice* and *feud* promiscuously, as if they were the same thing; and yet there was a good deal of difference between them, as there was neither fealty, nor homage, nor the other *feudal* rights annexed to the benefice; and that the benefice was not hereditary.

Probably benefices began then to be called *feuds*, when they became hereditary; and when those of whom the benefices were held began to demand feith and fealty from them. This fealty seems to constitute the *fee*; the word *fee* itself signifying, in the ancient Norman language, *faith*.

There is no fixing the precise era when these changes commenced; but *fee*, such as they now are, were not established all at once; but in different countries they took place at different times, and in different manners. The great lords, after the destruction of the Roman empire, having in several parts usurped the property of their benefices, laid likewise hold of the jurisdiction, and made their vassals their subjects; so that each became a sort of petty sovereign in his own territory.

Mezery observes, that the donation of *fee* to the nobles of France commenced under the reign of Charles Martel.

Hugh Capet, when he came to the crown, was himself so little established that he durst not oppose those usurpations, and was forced to suffer what he could not redress. See Le Fere, De l'Origine des Fiefs, and Ahaser's Origines Feudorum primoribus Gallie. See *FEEUDUM*.

The origin of *fee* in England, Camden carries as far back as the time of Alexander Severus. That prince having built a wall in the North of England to prevent the incursions of the Picts, he some time after began to neglect the defence thereof, and gave, as Lampridius, in Vita Alex. Severi, assures us, the lands conquered from the enemy to those of his captains and soldiers, whom that author calls *limperioris docti, & militis*; i. e. captains and soldiers of the frontiers, but it was on this condition, that their heirs should continue in the service, and that the lands should never descend to private persons, i. e. to such as did not bear arms. That prince's reason was, that people, who in serving defended their own, would serve with a great deal more zeal than any others. Such, according to Camden, was the rise of *fee* in our nation. Britan. p. 651.

However, the *feudal* policy originally derived from the Northern nations, and gradually established on the continent of Europe, was not universally received in England, though some traces of it may be discerned in the times of the Saxons, who were finally settled in this island as early as the year 600, and incorporated with the national constitution till the reign of William the Norman; and this was done not by the mere arbitrary will and power of the conqueror, but by the universal consent of the common council of the kingdom, on the same principle of self-security which had before induced the other nations of Europe to adopt it. The act of formally introducing the *feudal* tenures by law was probably the latter end of the year 1086, when the king was attended by all his nobility at Sarum, and all the principal landholders submitted their lands to the yoke of military tenure, became the king's vassals, and did homage and fealty to his person. This payment of the *feudal* services and other customs of Normandy upon the ancient Saxon laws of Edward the Confessor produced a different political system in this country, and changed both power and property in many respects; for those hereditary estates of the Saxon nobility and gentry which were allodial, and not subject to any *feudal* services, were converted into *feudal* and other lands which were of a *feudal* nature, and held by military service, having been granted only at will, or for a certain number of years, or at most for life or lives, and the grants of which were called *benefices*, were made *hereditary*. The *feudal* rights claimed in consequence of this establishment by the king over his tenants, and by them over theirs, were considerably mitigated by the charter of Henry I. See *Magna Charta*, Lord Lyndesdon's Hist. of King Henry II. vol. i. p. 59, &c. vol. iii. p. 97, &c. Blackstone's Comm. vol. ii. chap. 4.

All our lands in England (the crown-land, which is in the king's own hand in right of his crown, excepted) are of the nature of *feud* or *fee*. For though many have land by descent from their ancestors, and others have bought lands, yet land cannot come to any, either by descent or purchase, but with the burden that was laid on him who had the *novel fee*, or who first received it as a benefice from his lord to whom, and such as should descend from him, or to whom it should be otherwise conveyed and transferred: so that no man has *directum dominium*; i. e. the very property or domain in any land but the prince in right of his crown. Cumt. Britan. p. 93. Though he who has *fee* has *fee perpetuum* and *ultra dominium*, yet he owes a duty for it; so that it is not strictly his own. Indeed, as much as is imposed by the terms in which we express our highest right in lands, &c. the most a man can say, is, "I am seised of this land in my *fee* domain or demesne as of *fee*."

It should be observed, that our English lawyers do very rarely (of late years especially) use the word *fee* in its primary original sense, in contradistinction to *allodium* or *absolute* property, but generally use it to express the continuance or quantity of an estate; so that a *fee* in general signifies an estate of inheritance, being the highest and most extensive interest that a man can have in a *land*. Blackstone's Comm. vol. ii. p. 106.

In the law 37 Hen. VIII. cap. 16. *fee* is also used for lands vested in the crown; but it is from ignorance of the import of the word; for *fee* cannot be without fealty sworn to a superior, but the king owns fealty to no superior but God alone.

Fee is divided in our laws into *fee absolute*, called *fee simple*; and *fee conditional*, also called *fee-tail*. See *FEUD*.

Fee, frank. See *FRANK*.

Fee-simple, feudum simplex, is that whereof we are seised to us and our heirs for ever. Or it denotes an absolute inheritance, clear of any condition, limitation, or restriction to particular heirs, but defendible to the heirs general, whether male or female, lineal or collateral. It is a general rule, that the word *heirs* is necessary in the grant or donation, in order to make a *fee* or inheritance; but this rule does not extend to devises by will, not to fines and recoveries considered as a species of conveyance, nor to creation of nobility by writ, though in creations by patent, the word *heirs* must be inserted; nor to grants of lands to sole corporations and their successors; nor finally, to the case of the king, in whom a *fee-simple* will vest, without the words *heirs* or *successors* in the grant.

Fee-tail, feudum tantum, is that whereof we are seised with limitation to us and the heirs of our body. See *TAIL*.

Fee-tail is of two kinds, *general* and *special*.

Fee-tail general, is where lands and tenements are given to a man and the heirs of his body begotten. So that if a man seised of such land by such gift marry one or more

wives, and have no issue by them, and at length marry another, by whom he hath issue, this issue shall inherit the land.

Fee-tail special, is where a man and his wife are seised of lands to them and the heirs of their two bodies; where, in case the wife die without issue, and he marry another by whom he have issue, this issue cannot inherit the land, and therefore it is called *fee-tail*.

This *fee-tail special* has its origin from the stat. of Westm. 2. 13 Edw. I. cap. 1. Before that statute, all land given to a man and his heirs, either *general* or *special*, was reputed in the nature of a *fee*; and therefore so firmly held to him, that, any limitation notwithstanding, he might alienate it at pleasure for redress of which inconvenience the statute provides, that if a man gives lands to *fee*, limiting the heirs to whom it shall descend, with a reversion to himself and his heirs for default of such former heirs, the form and meaning of the gift shall be observed.

Estates in *general* and *special* tail are further distinguished by the distinction of sexes in such estates; for both of them may be in tail-male or female: as if lands be given to a man and his heirs male of his body, this is an estate in tail-male *general*; but if to a man and the heirs female of his body or his present wife &c. this is an estate in tail-female *special*; and in case of an entail male, the heirs female shall never inherit, nor any derived from them; nor a *co-heir*, the heirs male, in case of a gift in tail-female. The word *heirs*, or some other words of procreation, are necessary to make it a *fee-tail*, and to ascertain to what heirs in particular the *fee* is limited; though in wills and testaments greater liberality is allowed. The incidents to a reversion in tail, under the statute of Westm. 2. are chiefly these: 1. That a tenant in tail may commit waste on the estate-tail by selling timber, pulling down houses, or the like, without being impeached or called to account for the waste. 2. That the wife of the tenant in tail shall have her dower or thirds of the estate-tail. 3. That the husband of a female tenant in tail may be tenant by the courtesy of the estate-tail. 4. That an estate-tail may be barred or destroyed by a *FINE*, by a common recovery, or by lineal warranty descending with assent to the heir. By subsequent statutes, estates tail may be aliened, are liable to forfeiture for high treason, and are chargeable with reasonable leases, and with such debts as are due to the crown or specialties, or have been contracted with fellow-subjects in a course of commerce.

Fee, life, or quilibet, is a conditional *fee* that has a qualification subjoined to it, and which must be determined whenever this qualification is at an end; as in the case of a grant to A. and his heirs, *tenants of the manor of Dale*; whenever the heirs of A. cease to be tenants of that manor, the grant is entirely defeated. Blackstone's Comm. vol. ii. chap. 7. See *ENTAIL*.

Fee-expectant, feudum expectatum. See *EXPECTANT*.

Fee-farm, or Fee-farm, feud-farm, or Fee-farm, signifies lands holden to a man and his heirs for ever, under a certain yearly rent.

Fee-farm arises when the lord upon creation of a tenancy reserves to himself and his heirs, either the rent for which it was before let to farm, or at least a fourth part of the rent, and that without homage, fealty, or other services more than are especially comprised in the instrument.

Though by Fitzherbert it appears, that the third part of the value may be appointed for the rent, or the finding of a chaplain to say divine service, &c. And the nature of it is this: that if the rent be behind, and unpaid for the space of two years, then the lord or his heirs have action to recover the lands as their demesne.

Fee-farm revert of the crown, are such as issue to the kings of England from their ancient demesnes, many of which were alienated from the crown in the reign of king Charles II.

Fee is also used for the compass or circuit of a manor or lordship. Thus Bracton, in *idem* v. l. 2. § 2. *idem* *feudum*.

Fee is also used for a perpetual right incorporeal; as to have the keeping of persons in *fee*, rent granted in *fee*, and office held in *fee*, &c.

Fee also signifies a reward or ordinary due given to a person for the execution of his office, or the performance of his part in his respective art or science.

Thus, the lawyer, barrister, and physician, are said to have their *fees*; i. e. considerations for the pains taken with the client or patient. If a person refers to pay an officer his due *fee*, the court will grant an attachment against him, to be committed till the *fee* be paid; and an attorney may bring an action of the case for his *fee* against the client that retained him in his cause.

Fees also denote settled perquisites or allowances paid to public

nences, lodged every where immediately under the cuticula. They are formed of the subcutaneous nerves, which, for this purpose, first lay aside their outer membrane, and are left exceedingly soft and fenestrate; are continually moistened by a thin fluid humour, and only covered over and defended by the cuticle or scarf-skin. They are largest and most conspicuous in those parts chiefly designed for the office of feeling, viz. the tongue, the tips of the fingers and toes; and are contractile, and again expansive at pleasure.

Feeling, then, is thus effected: the tip of the finger, for instance, being applied to an object to be examined, by that intention of the mind the papillae are emitted or elevated, and being lightly rubbed over the surface of the object, a motion is impressed on them, which being thence propagated by the nerves communicating with them to the common sensory, excites the perception of heat, cold, hardness, or the like.

Hence we see why *feeling* becomes painful when the cuticle is worn off, burnt, macerated, &c. and why, when the cuticle becomes thick, hard, callous, or cicatrized, &c. the sense of *feeling* is lost; viz. whence the numbness impressed by the torpedo? why that exquisite painfulness under and at the roots of the nails? &c.

Feeling is, on many accounts, the most universal of our senses, there being no animal without it. Piny observes, that all animals have the sense of *feeling*, even those that are generally thought to have no other sense, as oysters and earth-worms. That naturalist declares it his own opinion, that all have the sense of tasting likewise: *Exstremum unguis insensum & gustatum est*. Nat. Hist. lib. x. cap. 71.

Naturalists observe, that spiders, flies, and ants, have the sense of feeling in a much greater perfection than men, though we have instances of persons who could distinguish colours by their *feeling*, and others who could perceive what people said by the same sense. See DEAZER.

FEIGNED *Alibi*, in *Lazar*. See FAINT *actio*.

FEIGNED *offus*. See FEIGNED *lingua*.

FEINT, in *Fencing*, a false attack, or shew of making a stroke or push in one part, with design to bring the enemy to guard that part, and leave some other part unguarded where the stroke is really intended.

Points are either single or double, high or low, without or within, &c. in prime, in tierce, in quarts, in demi, and in the whole circle; of one, two, or three measures. The *simple fence*, is a mere motion of the wrist, without stirring the foot, &c.

FEINT, in *Music*, a semi-tone; the same with what we also call *DIESTE*.

FEINT, in *Rhetoric*, a figure whereby the speaker touches on something, in making a shew of passing it over in silence. The Latins call this *prætermissio*.

FEL, in the *Materia Medica of the Ancients*, the name of a fruit much used by them in stomatic medicines, but very badly described to us. All that we know of the matter is, that there were three fruits brought from the Indies at that time, and called *fel*, *fel*, and *fel*; they were all of the same virtues, and seemed nearly allied to each other in all respects. Serapio tells us, that the fruit *fel* was about the size of the pistachia nut, and somewhat resembled it in shape; and Avicenna observes, that it was an Indian medicine, bitter, and hot like ginger; and that it was used as a stomachic. He also says the same thing of the two other fruits; whence it appears, they were nearly the same thing.

FEL, in *Medicine*, see GALL.

FEL *terra*, *gall of the earth*, a name by which some authors have called the small centuary, because of its great bitterness.

FELAGUS, in our *Law Books*, was used for a companion, or friend, who was bound in the decernary for the good behaviour of another. In the laws of king Ina, it is said, if a murderer could not be found, the parents of the person slain should have six marks, and the king forty; if he had no parents, then the lord should have it; *et si dominus non habet, seigniorium*. Leg. Ina, cap. 15.

FELAPTON, in *Logic*, one of the moods of syllogisms. In a syllogism in *felapton*, the first proposition is an universal negative; the second, an universal affirmative; and the third a particular negative.

FELF *hammers*, was anciently used for the faithful subjects. But it seems the word should be written **FEL** homagers.

FELFA, a name by which some of the chemical writers have called the sulphureted, or sulphurous waters.

FELIS, in the Linnæan system of *Zoology*, the name of a large genus of quadrupeds, of the order of the *felæ*; the characters of which are these: the fore-teeth are small, obtuse, and equal; they have three grinders; Vol. II. N° 126.

the tongue is furnished with prickles, all pointing backward; and the feet are formed for climbing, with claws which may be drawn in or exerted at pleasure.

To this genus belong the lion, tiger, leopard, cat of the mountain, lynx, ounce, and domestic cat; which see under their respective heads.

FELIS *volans*, the *fly-cat*, in *Natural History*, the name of an animal described by Scalliger, and supposed to be what we now call the flying squirrel, a species of squirrel which has a loose membrane on each side, connecting the fore with the hinder legs, which it can distend at pleasure, and by means of which it takes such long leaps, that it seems to fly.

FELIS *essentia*, in *Zoology*, a name given by many to the creature which produces the perfume called civet, and which we usually call the *civet-cat*, being, in the Linnæan system, a species of the *STURRA*. See Tab. II. *Quadrupeds*, N° 17.

FELLING of *Timber*. See **TIMBER**.

FELLOWS, or **FELLIES**, in *Artillery*, are six pieces of wood, each of which forms an arch of a circle, and these joined all together by distedges, make an entire circle; which, with a nave, and twelve spokes, form the wheel of a gun carriage.

Their thickness is usually the diameter of the ball of the gun they serve for, and their breadth something more. Their dimensions are as follow: for a 24 pounder, 5 inches thick, and 6 inches broad; for a 12 pounder, 4 inches thick, and 5 inches broad; for a 6 pounder, 3 inches thick, and 5 inches broad, &c. made of dry elm.

FELLOWSHIP, *Company*, or *Partnership*, in *Arithmetic*, is a rule of great use in balancing accounts amongst merchants and owners of ships; where a number of persons putting together a general stock, it is required to give every one his proportional share of loss, or gain.

The *golden rule*, several times repeated, is the basis of *fellows*, and fully answers all questions of that kind: for, as the whole stock is to the total thereby gained, or lost; so each man's particular share is to his proper share of loss or gain. Wherefore, the several sums of money of every partner are to be gathered into one sum, for the first term; the common gain, or loss, for the second, and every man's particular share for the third; and the golden rule is then to be wrought so many times as there are partners.

There are two cases of this rule, the one *without*, the other *with time*.

FELLOWSHIP *without time*, is where the quantity of stock, contributed by each person, is alone considered; without any particular regard to the length of time that any of their moneys were employed. An example will make this process easy.

A. B. and C. freight a ship with 212 ton of wine; A. laying out 1342l. B. 1178l. and C. 630l. towards the same; the whole cargo is sold at 32l. per ton. Query, what shall each person receive?
Find the whole produce of the wine by multiplying 212 by 32, which yields 6784. Then adding together the several stocks, 1342, 1178, and 630, which make 3150, the work will stand thus:

$$\begin{array}{r} 1342 \text{ --- } \text{Ans.} \text{ --- } 2890, 1993, \&c. \\ 3150 : 6784 :: \left\{ \begin{array}{l} 1178 \text{ --- } 2537, 0006, \&c. \\ 630 \text{ --- } 1356, 8 \end{array} \right. \end{array}$$

Proof 3150 6784

FELLOWSHIP *with time*, is where the time wherein the money, &c. were employed, enters into the account. An example will make it clear.

A. B. C. commence a partnership the first of January, for a whole year. A. the same day disbursed 100l. wherof he received back again, on the first of April, 20l. B. pays, on the first of March, 60l. and more, the first of August, 100l. C. pays, the first of July, 140l. and the first of October, withdraws 40l. At the year's end their clear gain is 142l. Query, what is each person's due?

A's 100l. multiplied by three months, the time it was in, makes 300l. and the remaining 80, by nine months = 720, in all 1020l. of A's contribution. For B. 60 into 10, gives 600; and 100 into 5, 500; in all 1100l. for B. For C. 140 into 3, gives 420; and 100 into 3, is 300; in all 720l. for C. Now, 1020 + 1100 + 720 = 2840 for the common antecedent, and the gain 142, is for the general consequent; the rule will stand thus:

$$\begin{array}{r} 1020 \text{ --- } \text{Ans.} \text{ --- } 51 \\ 2840 : 142 :: \left\{ \begin{array}{l} 1100 \text{ --- } 55 \\ 720 \text{ --- } 36 \end{array} \right. \end{array}$$

Proof 2840 142

N. B. All the particular times (if not to given) must be reduced into one denomination, viz. into years, months, weeks, or days.

FELL-wort, in Botany. See GENTIAN.

FELLO de se, is he that commits felony, by willingly and deliberately killing himself. The Saxons call him *self-bane*. He must be of the age of discretion, and *compos mentis*.

A *fel de se* is to be interred without Christian burial, with a stake driven through his corpse; and is to forfeit his goods and chattels real and personal; but he may make a devise of his lands, because they are not subjected to any forfeiture. However, these forfeitures are generally saved by the verdict of the coroner's jury, who find lunacy. See SUTHERLAND.

If a person *fel de se* is secretly made away with, so that the coroner cannot view his body, presentment is to be made of it by justices of peace, &c. in order to entitle the king to the forfeiture of goods.

FELON, in Surgery. See WHITLOW.

FELON-wort. See NIGHTSHADE.

FELONY, FELONIA, was anciently used for a violent and injurious action of a vassal, or tenant, against his lord.

Menage derives the word from *felonia*, formed of *fel*, or *felle*, which occurs in the capitulars of Charles the Bald, and is supposed to come from the German *felien*, or Saxon *falen*, *to fall*, or *to delinquere*. Others derive it from the barbarous Latin *felonia*. Lord Coke, Nicod, &c. derive it a *felis gale*, as being supposed to be done maliciously. Others derive it from the Greek *perona*, *to deride*. But the learned Speciman, with greater probability, deduces it from two northern words, viz. *fel*, which signifies *felis*, *felis*, or *leopard*; *felis*, and *felis*, which signifies *peris* or *valeris*; so that *felony* is the same as *perisum felis*, the consideration for which a man gives up his self, agreeable to the common expression, such an act is as much as your life, or estate, is worth. In this sense *felony* was equivalent to petty-treason, or it was a crime next below high-treason. The crime of *felony* imported confiscation of the fee, to the profit of the lord.

All those acts, whether of a criminal nature or not, which at this day are generally forfeitures of copy-hold estates, are styled *felony* in the feudal law.

FRANCOR was also applied to an injury of the lord to his vassal, which imported a forfeiture of the homage and service thereof, and made it revert to the overlord. Fidelity and *felony* are reciprocal between the lord and the vassal.

FELONY is also used, in Common Law, for any capital offence, perpetrated with an evil intention.

Though capital punishment does by no means enter into the true idea and definition of *felony*, the true criterion of which is forfeiture, for in all *felonia* which are punishable with death, the offender loses all his lands in fee-simple, and also all his goods and chattels; but in such as are not punishable, his goods and chattels only.

In a stricter sense, *felony* denotes all capital crimes below treason.

Felony includes several species of crimes, whose punishment is the same, viz. death: such as petit-treason, murder, theft, homicide, sodomy, rape, wilful burning of houses, receiving of stolen goods; breach of prison, rescue and escape, after one is arrested or imprisoned for *felony*, and divers others found in the statutes, which are daily making crimes *felony*, that were not so before.

Felony by the common law is against the life of a man, as murder, manslaughter, *fel de se*, *fel defendendo*, &c. against a man's goods, such as larceny and robbery; against his habitation, as arson and burglary; and against public justice, as breach of prison.

Piracy, robbery, or murder upon the seas, are *felonia* punishable by the civil law, and also by statute.

Felony is easily distinguished from treason.

From lesser crimes it is distinguished by this, that its punishment is death, though not universally; for petty-larceny, i. e. robbing of a thing under the value of twelve-pence, is *felony*, according to Brook, though the crime be not capital, but only a loss of goods. The reason Brook gives for its being *felony* is, that the indictment runs, *felonia* *appet*.

Till the reign of Henry I. *felonia* were punished by pecuniary fines; that prince first ordered *felony* to be hang'd, about the year 1120.

Felony is of two kinds, the one *higher*, which for the first time is intitled to the benefit of CLERGY as manslaughter. The other more heinous, is not allowed the privilege.

Felony is also punishable by loss of all lands, not entailed; and all goods and chattels, both real and personal; though the statutes make a difference in some cases concerning lands, as appears by stat. 37 Hen. VIII.

Felony ordinarily works corruption of blood, unless the

statute, obliging the offence to be *felony*, provide otherwise; as the stat. 37 Hen. VIII. cap. 12.

Persons indicted of *felony*, &c. where there are strong presumptions and circumstances of guilt, are not reprieveable; but for larceny, &c. when persons are committed, who are of good reputation, they may be bailed.

FELONY, *etymology of*. See APPAL.

FELONY, *etymology of*. See THEFT-SOTE.

FELONY, *etymology of*. See DISCOVERY.

FELONY, *etymology of*. See MISPRISON.

FELT, a kind of fluff, either of wool alone, or of wool and hair; neither spun, crossed, nor woven, but deriving all its confidence from its being wrought, and filled with laces and fire, and afterwards fashioned into a block or mould, by help of fire and water.

Callos, camels, and coney's hair, lamb, and sheep's wool, &c. are the most usual ingredients of felt; and hairs of all kinds are the works they are chiefly employed in.

The felt intended for a hat, being sufficiently filled, and prepared, is reduced into one piece, somewhat in the figure of a large funnel, in which state it remains ready to be put into form, and become a HAT.

FELUCCA, or FELUCCO, a little vessel with from ten to sixteen banks of oars, not covered over, much used in the Mediterranean as a passage boat. The natives of Barbary employ boats of this sort as cruisers.

The word is formed from the Arabic *felon*, a ship.

It has this peculiarity, that the rudder may be applied either in the head or stern; there being dispositions in both to receive it. For size, it may be compared to a sloop or frigate.

FEMALE, the sex that conceives and bears fruit.

An animal that generates within itself, is called *female*; and that which generates in another, *male*.

The female, in general, is more delicate, and less fitly qualified and weaker than the male. In the case of prey, as the falcon, hawk, &c. the male is stronger, and the female being bigger, is more fit to brood and rear the young.

The like is observed in many animals, particularly in deer, a four-legged degree, that the male is stronger, as he has weighed five or six times as much as the female of the same species, which has been equal to them.

For the natural proportion of males to females, see MARRIAGE.

Naturalists also distinguish male and female plants; male and female flowers, &c.

FEMALE *fecus*. See SCREW.

FEMBLE, the name given by the common people of Lincolnshire to the female hemp. There is no country where hemp sacreds better than in this, and great quantities are annually raised there.

FEME *creta*, in Law, denotes a married woman; who is also said to be under covert-baron.

By the law of England, a *free* covert committing a bare theft in company with, or by coercion of her husband, is not deemed guilty of felony; neither does she become accessory to a felony, by receiving her husband who has been guilty of it, as he does by receiving her. But if she commit a theft by the bare command of her husband or treason, murder, or robbery, in his company, or by his coercion, or keep a bawdy-house with him, she is punishable in the same manner, as if she was sole; and generally if she be guilty of any offence not capital, she may be indicted, &c. without making the husband a party. But if she incur the forfeiture of a penal statute, the husband must be made defendant in the action or information. Hawk. Pl. of the Crown, book 1. chap. 1. See COVERTURE.

FEME *file*, an unmarried woman, whose debts contracted before marriage become those of her husband after it. See CUSTOM of London.

FEMININE, or FEMININA, in Grammar, one of the genders of nouns.

The feminine gender is that which denotes the noun, or name to belong to a female. In the Latin, the feminine gender is formed of the masculine, by altering its termination; particularly by changing *us* into *a*. Thus, of the masculine *homo* *equus*, a *good* *homo*, is formed the feminine, *bona* *equa*, a *good* *woman*, &c. of *puer* *homo*, a *little* *man*, is formed *parva* *femina*, a *little* *woman*, &c.

In French, the feminine gender is expressed, not by a different termination, but a different article: that *le* is joined to a male, and *la* to a female.

In English, we are generally more strict, and express the difference of sex, not by different terminations, nor by different particles, but different words: as *dear* and *love*, *boy* and *girl*, *brother* and *sister*, &c. though sometimes the feminine is formed by varying the termination of the male into *ess*; as in *abbess*, *abbiess*, &c.

FEMI.

FEMININE rhythm. See RHYME.

FEMOREUS, in *Anatomy*, a name given by some of the authors on those subjects to a muscle, more generally called the *cruralis*, or *cruralis*.

FEMORIS quartus, in *Anatomy*, a name given by Valsalva and others to one of the muscles of the thigh, called by the later writers on its shape *profemur*.

FEMORIS femur, in *Anatomy*, a name given by Spigelius and others to a muscle, now generally called the *ILIOUS* *internus*.

FEM-OWL, an English name used in Shropshire, and some other counties, for the *caprimulgus*, or *goatsucker*, called also the *churn-owl*. It is a very beautiful bird, and more resembles the cuckoo than the owl-kind.

FEMUR, or *OI FEMORIS*, in *Anatomy*, the thigh-bone. See *Tab. Anat. (Optul.)* fig. 3. n. 20. and fig. 7. n. 22. See *Os*.

Dionis derives the word *femur*, from *fers*, because it bears the whole weight of the body.

The *femur* is the largest and strongest bone in the body, and its articulations are proportioned to its bulk and strength. Its upper part is jointed with the *scapulum*, by anarthrosis, the head of the *femur* being received into a cavity of the *scapulum*, and the two kept together by a strong cartilage or bandage. The lower end is articulated with the *tibia* by *gynghmus*, two heads of the *femur* being received into two cavities of the *tibia*, behind a cavity between the two heads, which receives a process of the *tibia*.

The *femur* is pretty much incurvated, or bent, the convex part being before, and the concave behind. It is divided into three parts, the upper, the middle, and the lower.

The upper consists of a head and a neck, and two tuberosities; the extremity or head is round and big, and received into the articulation of the coracoid, wherein it is tied by two ligaments, the one from the top, the other from the bottom of the *scapulum*, but both inserted into the middle of the head. This head is an epiphysis in children, and in some subjects remains so for a long time, and is therefore liable to be separated from the neck by any violent force. Immediately under this head is the neck of the *femur*, which is a small, long and a little oval apophysis, making an angle with the body of the bone, by means whereof the thigh and foot are kept at a due distance from each other, to make our standing the firmer; beside that the obliquity of the neck conduces to the strength of the muscles, which must otherwise have passed too near the centre of motion. The two tuberosities are called the greater and less *trochanters*.

The middle part or shaft of the *femur* is round, smooth, and polished on its fore-side, and rough on the hind-side; along which there runs a small ridge, the whole length of the bone, called *linea aspera*, serving for the insertion of muscles.

The lower part of the *femur* is divided by a sinus in the middle, into two heads or apophyses, called *epiphyses*, which make the *gynghmus* above mentioned; being both received into the sinus of the *tibia*.

Between the hind-parts of the head is a space for the passage of the great vessels and nerves, which go to the leg.

The *femur* has a very large cavity, running its whole length, filled, like the rest, with marrow. The cavity of the *femur* makes it serve as a buttress to the body, to prevent its falling, or bearing too much forward.

Surgeons and bone-setters should take care, that in fractures of the *femur* they do not endeavour to set it straight, which is against nature. See *Trauma*.

Cartilagen of the OI FEMORIS. No part of the *os femoris* is covered, except the uniform convexity of the head, and the articular portion of the lower extremity. The trochanters have no true cartilage, what appears like it being only the remains of tendinous inflexions; the cartilaginous substance, which to a certain age unites the apophyses to the body of the bone, does not belong to itself, because it is only found in the time of youth, and in adults is converted into a bone. The cartilaginous matter, by which the head of the *os femoris* is cemented, deserves, however, to be observed here, because that apophysis has been separated by violent falls. The convexity of the head of the *os femoris*, all the way to its symphysis with the neck, is covered with a very smooth, shining cartilage. A little below the middle of this convexity, and something toward the back part, there is a depression in the shape of a crescent, the cartilage being here interrupted by the insertion of the internal articular ligament of the head of the *os femoris*. The cartilage which covers the lower extremity of the bone is exactly fitted to the semi-oval convexity of the inferior surface of each condyle, and to the pulley formed by their union. Winslow's Anatomy, vol. i. p. 126.

Ligaments of the OI FEMORIS. The *os femoris* is connected by its upper extremity to the *os scapulae* and by the lower to the bones of the leg, by means of several ligaments. The ligaments of the upper extremity are two in number, one which surrounds the whole articulation thereof, with the coracoid cavity, and one contained in the articulation. The first is termed the *orbicular* ligament of the head of the *os femoris*, the other the *internal* ligament; and to these may be, though but improperly, added a third, which is of the nature of a capsular ligament. The orbicular ligament is the most considerable, the largest, and the strongest, of all the articular ligaments of the human body; it is fixed quite round the border of the coracoid cavity, and is made up of several sorts of fibres, and is much stronger and thicker in some parts than in others; the other, or internal ligament of the head of the *os femoris*, resembles a flat cord, and is composed of a bundle of flat fibres, closely interwoven. The ligaments of the lower extremity of the *os femoris*, by which this bone is connected with the leg, are six in number, one posterior, two lateral, the middle, or cruciate, and the capsular. The cruciate ligaments lie within the joint, and are fixed by one end to the back part of the tibia, or opening, which parts the two condyles; they are surrounded by the capsular ligament, but all the rest lie on the outside thereof, being closely joined to it. Of the two lateral ligaments, one is internal and broad, being fixed to the tuberosity of the internal condyle; the other is external, and narrow, and is fixed to the tuberosity of the external condyle. The posterior ligament is broad and thin, and being fixed a little above the convexity of the external condyle, it thence descends obliquely behind the great notch, and external condyle. The capsular ligament is, as it were, glued to the three former, and is fixed quite round the inferior extremity of the *os femoris* at a small distance above the anterior, lateral, and posterior parts of the cartilage, and above the posterior part of the great notch; and from the cartilage and notch, through the small space upward already mentioned, it covers the bone, and afterwards is inverted downwards, to form the capsula for the mucilaginous liquor of the joint. Winslow's Anatomy, p. 126, &c.

Excess of muscular power, in *Anatomy*, the name given by Valsalva and some others, to the muscle now called the *pectus major*.

FEN, in *Geography*, a kind of wet land, or rather morass. *Fens* are of two sorts: the first of a boggy consistence, composed of water and earth intermixed; these firm enough to sustain the tread of a man.

The second are pools, or collections of waters, with pieces of dry land raised here and there, above the surface thereof.

The former kind neither receive nor emit any rivers; but the latter are frequently the heads or springs of rivers; such is the head of the *Tamisa*, &c.

What the farmers call *fens* or *feny* lands, are of two kinds: first, those which are only drowned by upland floods and great rains, and are very large and lie upon the levels, so that the water cannot run off from them, but must be there till the hot weather and winds dry it off; and, secondly, those that are constantly wet, only that in dry times they are covered with shallow water than in others. In draining of these sorts of lands, which is the only means of making them useful to the public, two things are to be considered, first, the laying of them perfectly dry, which can only be effected by making cuts and drains, for carrying off the water from their lowest parts, and then from the whole. Or secondly, the taking off from them the great additional wetting they have from land floods, and long continued rains. The first method makes a perfect cure, the other is only a temporary relief, and makes the lands more serviceable in dry times, and leaves less for the sun to dry up.

Whatever is attempted in regard to the draining of *fens*, the lowest part of the ground is to be found out first, and the overflowing from great rains, and from land floods, must be provided for, in carrying off that way; for should this be neglected, all the labour and cost employed on the other principle would be thrown away. If it is found that this can be done, there must afterwards be cut a large drain through the middle of the land, and several smaller drains from all parts communicating with this.

The great drain must be dug deep enough to drain the whole level; and this, and all the others, must be made narrowest at the head, and wider all the way to the mouth, where they must be widest of all.

These drains must be all well cleared from mud and weeds every spring and autumn, and the water from land floods must be kept from coming in upon these lands, as much as possible, that there may be the less to be drained off.

off; the lower edges of the *fen* land must be for this purpose guarded with banks to turn the water into other channels. In effect they have many lands that lie below the high-water mark, and are above the low-water mark, and have land floods or floods running through them, which make a sort of small creek. These lands they have a very easy way of draining, though they are naturally very moist when they first enclose them from the sea; they do it with a bank, which they extend from one side of the land they design to take in to the other, excepting a space that they leave, where the creek, or land flood, runs into the sea. They then prepare a wooden frame, well planket, and of considerable thickness, fitted to the head of the creek, and capable of shutting it wholly up; in this frame they make several holes, in which are placed wooden troughs, made each of four boards, and fitted in size and number to the quantity of water that is to be discharged through them from the land floods. Each of these troughs is open toward the creek; but on the sea-side it has a door or flap, which opens when the land flood presses against it, and gives it free passage out; but when the sea-water is risen to the height of it, and presses it, it is shut by the force, and no sea-water is let in. When this head is prepared, they let it in, and stopping up the whole creek, they continue the banks on each side till they meet it; then all the land floods are let out at low water, and not a drop of sea-water can be admitted, so that the lands are kept dry and useful, which were before rendered useless, by being drowned with salt-water, at every high-water mark. The fresh-water of the creek is thus kept unmixed with the sea-water, and therefore affords good drink for the cattle, which is commonly very difficult to be had in this sort of lands, the tides spoiling what fresh waters there are every time they come up.

Several statutes have been made for draining fens, chiefly in Kent, Cambridgeshire, Bedfordshire, and Lincolnshire. 4 Jac. I. cap. 8. & 17. 15 Car. II. cap. 17. 16. 17 Car. II. cap. 17. 11 Geo. II. cap. 34. & cap. 37. 21 Geo. II. cap. 18. & 22 Geo. II. cap. 11. 16. & 19.

The wet grounds called *fen*, in Lincolnshire and elsewhere in England, bring many advantages to the inhabitants of their counties. Fowl and fish are very plentiful in them. The pike and eels are large and easily caught, but they are usually coarse. The duck, mallard, and teal, are in such plenty, as is scarce to be conceived; they are taken in decoys, by prodigious flocks at a time. They feed these fowl to London from Lincolnshire, twice a week on horseback, from Michaelmas to Lady-day; and one decoy will furnish twenty dozen, or more, twice a week, for the whole season, in this manner. The decoy-men contract with the people who bring them to London, at a certain rate, and they are obliged to take the whole number that is caught off their hands. Two teals are usually reckoned equal to one duck, and six ducks and twelve teals are accounted a dozen of wild fowl; and the usual market-price is about nine shillings for such a dozen. About Midsummer, when the moulting season is, a great number are destroyed also by the people of the neighbourhoods. The poor birds at this time are neither able to swim nor fly well, and the people going in with boats among the reeds, where they lie, beat them down with long poles. A fowl before Michaelmas, full flight of these birds arrive at the decoys from other places; they soon grow fat in them, and continue there a prey to the masters or owners, as long as the decoys are unfrozen; but when they are cool over, they fly away again, and go to the neighbouring seas for food. Phil. Trans. N. 227.

The *fen* also abound in a sort of herbage that is very nourishing to cattle; sheep and horses always grow fat upon it. These *fen*s are common, and the owners of cattle mark them, that they may be known. It is remarkable, that though all is open, the cattle used to one particular spot of ground, seldom leave it, but the owner may find them always in or near the same place. The people receive great advantage from the geese that abound here, beside the food which they afford; that is, from their feathers and quills; and the produce of these is so great, that the custom-house books in the town of Boston shew, that there are frequently sent away in one year three hundred bags of feathers; each bag containing a hundred and a half weight. Each pound of feathers brings in the owner two pence; and it may be thought strange by people unacquainted with these things, but it is a certain truth, that the owners pluck the geese five times a year for the feathers, and once for their quills. Each plucking affords about a pound; and many people have a thousand geese at a time, or more. They are kept at no charge, except in deep snowy weather, when they are obliged to feed them with corn.

Oats also grow well in many of the *fen* countries, and in good seasons bring increase and great advantage to the owner. There is also another vegetable of great profit to them: this is the *rapum flosculi*, the seeds of this they call cole-feed; and they make an oil from it, of great use in trade. They grind the feed between two large stones, the one standing perpendicularly on the other. The stones are made of a sort of black marble, and are brought from Germany. They sometimes turn them by sails, and sometimes by the drains which carry off the water from the *fen* lands.

The *fen* lying low, and being of a vast extent, are very subject to be overflowed by waters from the neighbouring high countries; and though great care and expence are used to keep them dry, they are often like a sea, and the sheep are obliged to be carried off in boats, and people to live in their upper rooms, and be supplied with provisions also by boats. See BOAT and DRAIN.

FEN-CHICK. See Mole-CHICKEN.

FEN is also the name of a very pernicious distemper to which hops are subject. It consists of mofs or mould, which spreads itself with great rapidity, and does great damage in the hop-ground.

FENCE, in Agriculture, is a hedge, ditch, wall, or bank, made round fields, woods, gardens, &c. The inclosures of grounds are in some places made by ditches full of water, and in others by walls either of stones alone, or of stones and earth. Where these materials are in plenty, they make very good fences, but in other places the common method is by quick-hedges. See EARTH-BANK, HEDGE, and WALL.

Fences for parks, and sometimes for gardens, are made of paling; which, if winter-fallen oak be used, will last many years; the pales should be clef thin, and the rails cut triangular, and the posts should not be placed too far asunder. *Fences* round parks, where deer are kept, should be six feet and a half high, and where there are red deer, the fence should be seven feet high. Parks are sometimes fenced with a single row of trees.

The white thorn is the best tree to plant for a fence, being a fast grower, and lasting a long time, and making a very good fence. It will succeed on any soil where a ditch and new bank are made, except it be wholly of gravel or sand, and even in this case it will thrive, if there happen a rainy season after the planting of it.

Some raise it by seeds, and others by young plants; the latter is the most expeditious way, for the seeds lie two years in the ground before they shoot, but they grow very fast after two or three years. Some prepare the haws, or fruit of the white thorn, by tying them up in a hair bag, and soaking them all winter; after this, if they are sown in February or March, they will come up the first year, and grow better than any other way.

Where *fen*s are scarce, it is a good way when the underwoods are *salut*, or rather the year before, to sow haws and flowers in them, and they will furnish a supply of young plants for hedges, without doing the woods any harm, because they may be drawn before they come to be too high. The white thorn is also of considerable value in some sorts of works; its root becomes very beautifully veined when old, and elegant boxes and combs are made of it. It is used by some also in the business of lolling, and would be more so, if its beauty were more known. The crab and the sloe-tree, or black thorn, come next in value to the white thorn, for quicks for *fen*s.

The crabs are to be sown by kernels, pulp and all, and they will come up the first year; and a set of young crabs planted thick enough, make an excellent fence. The black thorn is not so much approved, because it is not so sure of growing, and if it does, its roots spread, and it is apt to run in too much upon the land. The bushes of black thorn are however the best of any for dead hedges, and for mending of gaps; and they have another advantage over the white thorn, which is, that cattle are not so apt to crop them. The black thorn will grow on any soil where the white grows, but the richer the mould is, the better it will thrive.

Holly is another excellent shrub for a fence; it is indeed much the best of all the *fen*s bushes; but it grows so slow, and is so uncertain, that the farmers are afraid of waiting for it, or of trusting to it; but where it succeeds, it makes amends for the delay in its thickness, height, and strength. It is to be raised like the white thorn, either by sets or berries, and the berries in the same manner lie two years in the ground before they come up. It will grow on any soil, even on the driest gravel, or among stones and rocks. It delights most in light grounds. If it be raised in plants, they should be about the thickness of a man's thumb, and planted in a moist season, either in spring or autumn; they must be shaded

fraded well with straw or haulm after they are set, and must be carefully watered, as soon as they begin to shoot, otherwise they will all perish.

If any of them seem to perish, they must be cut off close at the roots, and they will often sprout out vigorously thence again. The ground must be dug up all about them at times, which very greatly promotes their growth; and the farmer must keep his sheep from them, for they are very fond of cropping the young plants.

Field mice are apt to gnaw the roots of holly in hard winters; and many of these trees are supposed to be killed by the *frank*, when the teeth of these little vermin have really done the mischief.

The best way of raising a *fence* of these trees, is to plant them with the quick or white thorn, four plants of that to one of holly; these will thrive very well together; and while the white thorn grows very speedily, the holly will take its time; as this grows large, the white thorn may be pulled up by degrees, till at length there is only the holly left; and if this is found to be thick enough, the boughs of it which grow nearest the ground may be laid down and covered with earth, and they will find up innumerable suckers, which will fill up all the gaps.

Beside these there are very good *finns* made of furze, of alder and even of elder, in some places, on proper soils. Elder sticks, or truncheons, ten or twelve feet long, are to be cut and stuck in the bank slope-wise each way, so as to make a chequer-work. This makes the speediest shelter of any. When the trees grow old they are also still of value; their wood is a very fine one for turning, and is at least equal to box, if not surpassing it.

The elder-tree makes an extremely good fence in watery places; and when planted on the banks of rivers is of great use in preventing them from being undermined by the current; the roots being very numerous, strong, and compact. It is always sending suckers also from its lowest roots, which makes it very useful where streams wear away their banks, and are wakening their course.

The furze bush, though an irregular grower, makes an excellent fence on dry banks where nothing else will grow. It may be raised either by seeds, or by sets; but the seeds are the best, especially those of the French furze, which grows to the height of fifteen or sixteen feet, and is not subject to spread with its roots, and get into the good ground, as our common heath furze will always do. This has the advantage of being a very speedy grower. It will make a very good hedge in three years, if taken care of. It must be kept well weeded while young; and the sheep must be kept away from it; for they are very fond of its young shoots. But it only requires this care for a little while; for when grown up to any considerable height, nothing can hurt it. If a furze-hedge be clipped, it will grow large and thick; but left to itself, it will run up to a considerable height, and afford good shelter, and yield an excellent fuel. They sow much of the poor land in Devonshire with furze, and make a very considerable advantage of it. Miller's Gard. Dict. and Mortimer's Husbandry.

Fence made with horn-beam plants are very common in Germany. On a parapet of earth, with a ditch on each side, the horn-beam sets are planted in such a manner, that every two plants may be brought to intersect one another, in the form of St. Andrew's cross. The bank is scraped off in the place where they intersect, and they are bound together with straw; the two plants unite together in a kind of indissoluble knot, and push from thence horizontal flanking shoots, which form a sort of palisado, or *chevaux de frise*. Hedges of this kind, pruned annually, will, in a few years, render the fence impenetrable in every part.

Fence-mouth (*monstrum prohibitum*, or *monstrum exitum*) is a mouth wherein the female deer fawn; for which reason it is unlawful to hunt in the forest during that time.

It begins fifteen days before Midsummer, and ends fifteen days after; being in all thirty days.

There are also certain *fence* or *defence* months, or seasons for fish, as well as wild beasts; as appears by Stat. Westm. 2. cap. 13. in these words:

"All waters, where salmon are taken, shall be in *defence* for taking of salmon, from the nativity of our Lady, unto St. Martin's day. And likewise, young salmon shall not be taken or destroyed by nets, &c.

"from the middle of April, to the nativity of St. John Baptist, &c.

FENCING, the art of defence; or of using the sword, to wound an enemy, and preserve one's self from his attacks.

Fencing is one of the exercises learnt in the academies, &c.

The art of *fencing* is acquired by practising with *rozzis*, called in Latin *rudia*, whence *fencing* is also denominated *gladiatoria rudaria*.

Vol. II. N° 127.

Pyrrad assures us, that the art of *fencing* is so highly esteemed in the East Indies, that none but princes and noblemen are allowed to teach it. These masters wear a badge or cognizance on their right arms, called in their language *flam*, which is put on with great ceremony, like the badges of our orders of knighthood, by the kings themselves.

Montaigne informs us, that when he was a youth, the nobility all shunned the reputation of being good *fencers*; as something too sordid, and designing, and apt to corrupt virtuous manners.

Fencing is divided into two parts, *simple* and *compound*. *Simple* is that performed directly and nimbly, on the same line; and is either *offensive*, or *defensive*. The principal object of the first is whatever may be attempted, in pushing, or making passes, from this or that point, to the most uncovered part of the enemy. The second consists in parrying, and repelling the thrusts aimed by the enemy.

The *compound*, on the offensive side, includes all the possible arms and inventions to deceive the enemy, and make him leave that part we have a design on, bare and unguarded, upon finding we cannot come at it by force, nor by the agility of the simple play.

The principal means hereof are *feints*, appeals, or *appels*, which consist in a sudden beat of your blade on the contrary side to that on which you join your adversary, and a quick disengagement to that side again, clashing, and entangling of the swords, half thrusts, &c. and in the defensive, to push in *PARRYING*.

The proper attitude in *fencing* is to hold the head upright, though the body hath an inclination forward on a longe, and all the weight rests on the left branch when on *GUARD*. The feet, hand, body, arm, and sword, must be to the line. For an explication of other terms in this art, see the articles *BEAT*, *CARRYING*, *FLANCO*, *NADE*, *GLIZADE*, *LOCK*, *LUNCH*, *THRAUST*, &c.

FENID, in the *Sea Language* imports the time as *defend*. Hence the phrase *sending the boat*, &c. that is, saving it from being dashed against the rocks, shores, or ship's side.

Hence also *FENDERS*, any pieces of old cable-ropes, or billets of wood, &c. hung over the ship's side, to *send* or keep other ships from rubbing against her, or to prevent her from striking or rubbing against a wharf or quay.

FENDER-iron. See *BOLTS*.

FENDUE en pal, in *Heraldry*, a French phrase, applied to a cross, to denote it sloven down from top to bottom and the parts set at some distance from one another.

FENESTRA, in *Anatomy*, a name applied to two holes, or apertures, in the inner ear.

The *fensivæ* are two openings in the labyrinth; the first of them is inclosed by the basis of the *stapes*, and from its oval figure denominated *fensivæ ovalis*.

The latter, called *rounda*, is closed with a transverse transparent membrane, placed a little within the surface of its aperture.

These *fensivæ*, with the whole labyrinth, are comprehended in that part of the *os temporale*, properly called from its hardness *petrosum*.

FENGELD, in our *Antient Writers*, is used for a tax or imposition raised for repelling of enemies.

It comes from the Saxon *feind*, an enemy, and *geld*, money.

FENNEL, *Faniculum*, in *Botany*. Linnaeus has joined this genus to *anethum*. See *DILL*. Its characters are these: it hath an umbellated flower; the seed umbel is composed of many smaller, which have no involucreum; the flowers have five incurved petals, and five filamina, terminated by roundish summits; the germen is situated under the flower supporting two small styles, crowned by roundish stigmas, which afterward turns to an oblong fruit, deeply channelled, dividing into two parts, each containing a single seed, flat on one side, but convex and channelled on the other. There are three species.

The common *fennel* is so well known, as to need no description. It has a strong fleshy root, which penetrates deep into the ground, and will continue several years; it flowers in July, and the seeds ripen in autumn. The best time to sow the seeds, is soon after they are ripe; the plants will come up in the spring, and require no other care than to keep them clean from weeds; and they will grow in any soil or situation. The leaves, seed, and root of this, are used in medicine; the root is one of the five opening roots, and the seed one of the greater carminative seeds. There is a simple water made from the leaves, and an essential oil from the seed and leaves.

Miller's Gard. Dict.

The oil obtained from the leaves on the upper part of the plant is much finer, lighter, and more subtle, than the oil obtained from the lower leaves. The former oil swims on water; and the latter oil sinks. Neumann.

There

5 X

There is also a strong water or brandy, made of the seeds of *fennel*, called *fennel-water*. The ingredients are *fennel* seeds, liquorice, brandy, and white wine, which are distilled together; and to the essence thereof are added spirit of wine, sugar, and sweet almonds; the whole is then strained, &c.

The leaves of the second fort, called *swet fennel*, are very long and slender, growing more sparingly, and not ending in so many points as those of the common fort; the stalks do not rise so high; the seeds are longer, narrower, and of a lighter colour. The seeds are generally imported from Germany or Italy, and are by some preferred to those of the common fort, as being much sweeter. These seeds are an useful stomachic and carminative, and are sometimes given in powder, from a scruple to a dram, and sometimes caustic.

The third fort is supposed to have been brought from the Azorian islands, and has been long cultivated in Italy as a fallow herb, under the title of *finocchio*. There are not many English palates which relish it; nor is it easy to be furnished with good seeds; those which are annually brought from Italy are seldom good; and it is difficult to preserve the plants through the winter in England.

The seeds of this fort are narrow, crooked, and of a bright yellow colour; they have a very strong smell, like aniseed, and are very sweet to the taste. Miller.

As to the method of cultivating this plant, see *FINOCCHIA*.

FENNEL-flower, or *Devil in a bush*, *Nigella*, in *Botany*, a genus of the *pentandria pentagyna* class. Its characters are these: the flower has no empalement, but a leafy perianthium; it has five oval, obtuse, plain petals, which spread open, and are contracted at their base, and eight very short nectariums, situated in a circle, each having two lips, the exterior larger, the inferior blunt, plain, and convex. It has a great number of awl-shaped stamina, which are shorter than the petals, terminated by obtuse, erect, compressed, summits; and in some five, in others ten, oblong, convex, erect germina; the germina afterward become so many oblong, compressed capsules, divided by a suture, but connected within, filled with rough angular seeds. There are seven species.

All these plants may be propagated by sowing their seeds upon a bed of light earth, where they are to remain. The season for sowing these seeds is March; in July they will produce their flowers, and their seeds will ripen in August, when they should be gathered and dried. Miller.

The seed of this plant is used to dissolve the viscid matter, which, gathering in the sinuses of the head, produces catarrhs. For this purpose infuse a pugil of marjoram leaves in a glass of white wine, and add a dram of *nigella* seed; strain the whole through a linen cloth, and mix the wine throughly up the nose. For the colic, a pistil is made of the tops of chamomile, meadow, and *nigella* seeds. The essential oil has the same virtues; it is very incisive and expectorating; the infusion of the same seed in wine is diuretic, and provokes the menses.

FENNEL-plant of Crete. See *GARIBOLLA*.

FENNEL-giant, *Ferula*, in *Botany*, a genus of the *pentandria digyna* class. Its characters are these: it hath an umbelliferous flower, the principal umbel of which is composed of several smaller, called rays; the involucre is composed of several narrow leaves, which fall off; the principal umbel is uniform. The flowers have five oblong petals, and five stamens of the same length, terminated by single summits. Under the flower is situated a turbinate germin, supporting two reflexed styles, crowned by obtuse stigmas, which afterward becomes an elliptical, compressed, plain fruit, dividing in two parts, each having a large elliptical plain seed, marked with three lines on each side. Linnaeus reckons nine, and Miller eight species.

The parts in use are the medullary substance of the stalks, the seeds, and the juice, or gum, which is the *SAGARENUM* of the shops. Mr. Ray says, that the people of Sicily use the pulp of the *fennel major*, or Pliny's female *fennel-giant*, for tinder to light their fires; and if this was practised by the ancients, we may guess why the poets feigned, that Prometheus stole fire from heaven, and carried it to the earth in a hollow fennel.

FENNEL, *big*, or *Silphium-vart*, *Pentstemon*, in *Botany*, a genus of the *pentandria digyna* class. Its characters are these: it hath an umbelliferous flower; the cover of the large umbel composed of many linear, reflexed leaves; the empalement of the flower is small, and indented in five parts, and the petals of the great umbel are uniform. Each flower is composed of five oblong incurved petals, which are equal and entire; they have each five hair-like stamens, terminated by single summits, with an oblong germin situated under the flower, supporting two small styles, crowned by obtuse stigmas; the germin turns to an oval channelled fruit, splitting in two parts,

containing two seeds, convex on one side, compressed on the other; with three raised furrows, and a broad membranaceous border indented at the top. Linnaeus enumerates five, and Miller four species.

The common *big's fennel* is found in wet and moorish places, and about fen ditches. It flowers in June and July. Its root is esteemed of great use, as an expectorant and attenuant. It is prescribed in diseases of the breasts and lungs, particularly in those in which those parts are loaded with a tough phlegm. It is also recommended in all obstructions of the viscera. It promotes urine, and is recommended in nephritic cases. The old authors have spoke greatly of its efficacy in all nervous cases, and have recommended it as a singular remedy in lethargies, palsies, epilepsies, and the like. If the roots are wounded, when fresh, in the spring or autumn, they yield a yellow juice, which dries into a solid gummy resin, that is recommended as an aperient and antiphlegmic. Lewis's Mat. Med.

FENNEL, *springing in Botany*. See *TRAPHAL*.

FENNEL, *sea*. See *SAMPHERE*.

FENUGREEK, *Fenugreek*, *Trigonella*, in *Botany*, a genus of the *diadelphia distandra* class. Its characters are these: the empalement of the flower is well shaped, of one leaf, cut at the top into five almost equal segments; the flower is of the butterfly kind; the standard obtuse, oval, and reflexed; the two wings are oblong, reflexed, and spreading flat like the standard, so as outwardly to appear like a regular flower of three petals; the keel is very short, obtuse, and occupies the navel of the flower; it hath ten short rising stamens, nine of which are joined, and one stands separate, terminated by single summits; and an oval, oblong germin, supporting a single style, crowned by a rising stigma; the germin afterward turns to an oblong oval pod, compressed, filled with kidney-shaped seeds. Linnaeus enumerates ten, and Miller six species.

The first fort is the common *fennel*, whose seed is used in medicine. When the plant grows naturally is uncertain; but it is cultivated in the South of France and in Germany; from whence great quantities of the seed are annually imported here for use. It is also much cultivated in India.

This plant has not yet been cultivated in any quantity for use in England, as it has generally proved a very uncertain crop, occasioned by the inconsistency of the weather. The seed from the continent is therefore always to be preferred. Miller.

The seeds of this plant contain an expressible oil blended with resin and mucilage, but no essential oil; to redress spirit they communicate the whole of their distinguishing smell and taste; and afterward to water a strong favourable mucilage. The principal use of these seeds is in cataplasms and fomentations, for softening, maturing, and dissolving tumors; and in enlivening, carminative clysters. They are an ingredient in the *electua medicamentum* of the shops. Ground in a mill, they are used in drinks for horses. Neumann and Lewis.

The seed is less than mustard-seed, very hard and solid, of a triangular form, and a strong disagreeable smell; when new, it is of a yellow gold-colour, but when long kept, ruddy, or brown.

FEODAL, *Feodali*, or *Feudali*, of or belonging to a feud, or FEE. Hence *feudal services*, &c.

FEODALITY, the FEALTY paid to the lord by his feudal tenant.

FEODARY, *Feudary*, or *Feudatory*, an officer anciently made and authorized by the master of the courts of wards. 32 Hen. VIII. cap. 26.

His office was to be present with the escheator, at the finding any office of lands; and to give evidence for the king, concerning the tenure, and the value thereof; to survey the land of the ward after the office found, and rate it. He also assigned the king's widows their dowers, and received the rents of wards lands. This office is taken away by Stat. 12 Car. II. cap. 24.

FEODATARY, or *FEUDATARY*. See *FEODARY* and *FEUDATARY*.

FEODER, a MEASURE for liquids, used throughout Germany.

FEODITAS, in *Old Writers*, is sometimes used for *fidelity*, or *FEALTY*.

FEODUM, or *FEODUM*, the same with *fief* or *fee*.

FEOFFMENT, derived from the verb *feoffare*, or *infundere*, is *to give*, to give one a feud, in Common Law, is the most ancient method of conveyance, and signifies a gift or grant of honours, castles, manors, messuages, lands, or the like corporal or immovable things, to another in fee-simple; that is, to him, and his heirs for ever, by the delivery of seisin, and the possession of the thing given. See *FEE*, and *LIVERY*.

When this is done by writing, it is called the *deed of feoffment*.

In every sacrifice, the giver is called the *offerer*, or *sufficer*, and he that receives, the *offerer*.

The proper difference in our law, between a *offerer*, and a donor, is, that the *offerer* gives in fee-simple; and the donor in fee-tail.

FERRE, in the Linnaean system of Zoology, one of the orders of animals, of the class of *mammalia*; the characters of which are, that they have sharp teeth; the upper fore-teeth are six in number, and the canine or dog-teeth longer than the rest. Of this order are the bear, the lion, the tiger, the cat, the weasel, the ferret, the badger, the hedge-hog, the mole, and the bat, which this author makes not a bird, but a quadruped, with its fore-feet expanded into a sort of wings, &c.

FERAS nature, in our Law, signify birds or beasts that are wild, in opposition to such as are tame: such are hares, foxes, wild geese, or the like, wherein no man may claim a property. 2 Cro. 303.

FERALIA, in Antiquity, a feast held by the Romans, on the twenty-first of February, in honour of the dead. Vide Mem. Acad. Inscript. tom. i. p. 43.

Vario derives the word from *inferi*, or from *ferre*; on account of a report carried to the sepulchres of such as the last offices were that day rendered to. Festus derives it from *ferre*, on account of the victims sacrificed. Volusus observes, that the Romans called death, *ferre*, *cruci*, and that the word *feralia* might arise thence.

Macrobius, Saturn. lib. i. cap. 13. refers the origin of the ceremony to Numa Pompilius. Ovid, in his Fasti, goes back as far as Aeneas for its institution. He adds, that on the same day a sacrifice was performed to the goddesses Muta, or Dumb; and that the persons who officiated, were an old woman, attended with a number of young girls.

FER de fourchette, *croix à fer de fourchette*, in Heraldry, is a cross, having a forked iron at each end, like that formerly used by soldiers to rest their muskets on; by which it is distinguished from the cross *fourche*, the ends whereof turn forked; whereas in this, the fork is fixed on the square ends; as represented in Tab. Heraldry, fig. 20.

FER de moulin, *q. d. iron of the mill*, is a bearing in Heraldry; supposed to represent the iron ink, or ink of a mill, which sustains the moving mill-stone. See a representation of it in Tab. Heraldry, fig. 21.

FERD-wit, or **FERD-wit**, in our Ancient Customs, a formula, by which the king pardoned manslaughter, committed in the army.

The word is formed of the Saxon *ferd*, army, and *wit*, punishment.

FERD-FARE, from the Saxon *ferd*, army, and *fare*, journey, in our Old Writers, is used for being discharged from going to war.

FERENTARI, or **FERENDARI**, among the Romans, were auxiliary troops, lightly armed; their weapons being a sword, bow, and arrows, and a sling; which were much less cumbersome than a buckler, battle-axe, pike, &c.

The name seems to have been derived a *ferendi munus*; these being auxiliary forces; though Varro thinks they might be so called, because the sling and stones *feruntur*, *manu tenentur*.

We have also mention of another sort of *ferentarii*, whose business was, to carry arms after the armies, and to be ready to supply the soldiers therewith in battle.

Lysias uses the name *ferentarii* for the *cataphracti equites*, i. e. cavaliers, armed cap-a-pie.

FERETRUM, among the Romans, the bier used in carrying out the bodies of the dead; which duty was performed by the nearest male relations of the deceased: thus sons carried out their parents, brothers their sisters, &c. See BURIAL.

FERIE, among the Romans, were holy-days, or days wherein they abstained from work.

The word *ferie* is usually derived a *ferendis victimis*, on account of the victims killed on these days. Martinius says, that *ferie* were so called *quia legum huiusmodi dies sacri, holi days*. Others observe, that all days in general, though they were not feast-days, were anciently called *ferie*, or, as Volusus reads it, *festae*; whence, according to that author, was formed the word *ferie*.

The *ferie*, or *dies ferati*, were observed and distinguished chiefly by rest; whereas the *festi*, or *dies festi*, beside a cessation from labour, were celebrated with sacrifices and games; so that there were *ferie*, which were not feast-days; though authors frequently confound the *ferie*, and *festi*.

Others confound the *ferie* with the *dies nefasti*, or non-court-days.

The Latin *ferie* amounts to the Sabbath of the Hebrews. The Romans had divers kinds of *ferie*; their names, at

least the principal thereof, are *seculares*, or summer *ferie*; *annuales*, yearly *ferie*; *compulsivae*, *ferie*, of the streets, and cross-ways; *consequae*, *ferie*, which the magistrates promised every year, *devotivae*, for the expiation of a family polluted by the death of any one; *imperativae*, or *indulgentiae*, those decreed by the magistrate; *Latinae*, the Latin *ferie*, instituted by Tarquin the Proud, for all the Latin people, amounting annually, says Dion. Hal. to forty-seven nations, being celebrated on mount Alba, in memory of the peace concluded by Tarquin with the people of Latium. These *ferie Latinae* were either ordinary or extraordinary. They continued at first only for a day; but after the expulsion of Tarquin, a second day was added, and a third after the reconciliation between the plebeians and patricians; and in process of time they were prolonged to four days. At these feasts a bull was sacrificed, and each town contributed a certain quantity of meat, wine, and fruits. *Missa ferie* were those of harvest; there were also *paganalis ferie*, or *PAGANALIA praedicantiae*, which were what we properly call the vigils, or eves of the feasts; *privatae*, or *propriae*, those peculiar to the several families; as the *familia Claudia*, *Emilia*, *Julia*, &c. *publicae*, those observed by all in general, or for the public weal; *semitinae*, those held in seed-time; *florivae*, those kept constantly to the same day of the year; *Saturalia*, whereof we shall speak in their place; *stultorum ferie*, or *quintilinae*, the *ferie* of fools, held on the seventeenth of February; *victoriae ferie*, those of victory, in the month of August; *vindemiae*, those of the vintage, from the twentieth of August to the fifteenth of October; *Vulcani ferie*, those of Vulcan, which fell on the twenty-second of May. See FEAST.

FERIE was also used among the Romans for fast-days; because it was their custom to hold their fasts on the *dies feriati*, or holidays. Struv. Syntr. Antiq. Rom. cap. ix. p. 425. 443, &c.

FERIA is still retained in the Romish breviary, though in a sense somewhat different from the *ferie* of the ancients; being applied to the several days of the week, beginning with Sunday; provided none of those days be a feast or fast-day. Thus, Monday is the second *feria*; Tuesday the third, &c.

The word *feria* in this sense, is doubtless borrowed from the ancient *ferie*, a day of rest. Accordingly, Sunday is the first *feria*; for anciently all the days of Easter-week were accounted festival days, by a decree of Constantine; whence these seven days were called *ferie*; Sunday being the first, Monday the second, &c. And this week being then accounted the first of the ecclesiastical year, they afterwards accustomed themselves to call the days of the other weeks after the same manner, *feria*, *secunda*, &c. *feriae*. Though others will have it, that the days of the week were not called *ferie* from the people's resting, that is, on account of being obliged to abstain from servile works; but to advertise the faithful, that they ought to abstain from sin. See Dorand, De Off. Div. lib. viii. cap. 1.

These are the ordinary *ferie*; but besides these, they have extraordinary, or *gravior ferie*; viz. the three last days of Passion-week; the two days following Easter-day, and Whitunday; and the second *ferie* of Rogation.

FERIAL days, *dies FERIALES*, or **FERIE**, among the Ancients, signify holidays, or days vacant for labour, and pleading.

But in the Stat. 27 Hen. VI. cap. 5. and in Fomelice, De Laudibus LL. Anglie, *ferial days* are taken for working days. S. Sylvester ordained—*Sabbati & dominici dies nomine regis, reliquis hebdomadae dies seculorum nomine distinctos, ut jam ante in ecclesia vocari ceperant, appellari*.

So that *ferial days* are properly all the days of the week, except Sunday.

FERIJEE, in the dress of the Egyptians, is a sort of skirt worn over another garment, and made either of black woollen, or of other coloured cloth furled; this by the more genteel people is left open before. It somewhat resembles a night-gown.

FERISON, in Logic, a mood of the third figure of syllogisms. In this mood the first proposition is an universal negative, denoted by the vowel *e*; the second a particular affirmative; and the third a particular negative, signified by *i* and *e*.

FERLING, in our Old Statutes, is used for the fourth part of a penny. *Assil. pennis & cervici*, 5 Hen. III.

FERLINGATA terra, in our Old Writers, according to Blount, is the same as *sequestrata terra*, which lord Coke on Littleton says, was a quarantine, or thirty-two days of land. But according to the authorities quoted by Du-Cange, Gloss. Lat. voc. *Quarantena*, it contained but forty perches.

FERLINGUS terra. See **FERLINGATA terra**.

FERM,

FERM. FIRM. in *Law*. See FARM.

FERME *a ferme*, in the *Marine*, signifies to exert in the same place without stirring or parting.

FERMENT, of *fervere*, *to boil*, in *Physic*, any body, which being applied to another, produces a fermentation therein; or, any thing capable of exciting an intestine motion in the parts of another; and of swelling or dilating the same.

Thus, the acid in leaven is a ferment, which makes bread rise or swell. And the moisture in hay is a ferment, which heats, and makes it smoke. Thus also, rennet is a ferment, which curdles and breaks milk; and barn, or yeast, is the ferment that sets wort a working, &c.

Those things are called ferments in an allusive sense, which when added to the liquor, only correct some fault therein, and by removing some obstacle to the fermentation, forward it by secondary means; as also such as being added in time of fermentation, make the liquor yield a larger proportion of spirit, and give it a finer flavour; all these additions have the name of ferments among our distillers, but improperly. The primary use of ferment is, to fire time, and make dispatch of business, while they only occasionally and accidentally give a flavour, or add to the quantity of the spirit; and accordingly all fermentable liquors may, without the least addition, only by a due application of heat, be brought to ferment more perfectly, though it will be more slowly than with the addition of any ferment. The general ferments used on these occasions are the flowers and yeast of fermentable liquors generated, thrown up, or deposited, during the time of the fermentation in that liquor, or after the end of it. There are two of these ferments, procurable in large quantities, and at a small price; these are beer yeast, and wine lees. A prudent and artificial management of these, might render the business of the brewery for distillation, as in the business of the malt-distiller, &c. much more easy and advantageous. It has always been found a great difficulty to procure these ferments in proper quantities, and preserve them always ready for use; and this has been a great discouragement to the business, and hence some have been obliged to contrive artificial ferments, or to form mixtures or compounds of particular fermentable ingredients; but this has been attempted without any great success, all these mixtures falling short even of the common baker's leaven in their use.

When the proper sort of ferment is pitched upon, the operator is next to consider its quantity, quality, and manner of application. The quantity must be proportioned to that of the liquor, to its tenacity, and the degree of flavour it is intended to give, and to the dispatch required in the operation. From these considerations he will be able to form a rule to himself; but till such a rule is formed, or, in order to the forming of it, proper trial will show how much suffices for the purpose. The way is to begin with a little, and to add more occasionally, the weight of the whole being noted beforehand; so that on weighing the remainder after the proper quantity is taken away, it will be found how much exactly has been used out of it for the business.

Among the several ingredients of which fermentable liquors are made for the service of the distillery, treacle requires more ferment than almost any other. This is not wonderful on a just consideration of the nature of the subject, since the manner in which that concrete juice is made, must render it greatly unfit for fermentation afterwards, though the original product of a vegetable juice very much disposed to it in its own nature. The strength of the fire used in the sugar making, and its long continuance and almost immediate contact, and the lime and other alkalies used in refining the sugar, that is, in making the treacle, do so condense, indurate, and scorch the body of this juice, and absorb its acid, that it is scarce to be expected that it should ferment at all, even with the addition of yelp, or other powerful saline and acid or acid stimulants, which tend to break the viscous and adult connections of the particles.

The greatest circumspection and care are necessary in regard to the quality of the ferment, if a pure and well flavoured spirit be required. It must be chosen perfectly sweet and fresh, for all ferments are liable to grow musty and rancid; and in this state they are mixed with the fermentable liquor, they will communicate their rancid and fishy flavour to the spirit, which will scarce ever be got off by any subsequent refining. If the ferment be sour, it must by no means be used with any liquor, for it will communicate its flavour to the whole, and even prevent its rising to a head, and give it an acetous, instead of a vinous tendency. When the proper quantity of a suitable and well conditioned ferment is got ready, it must be put to the fermentable liquor in a state barely tepid, or scarce lukewarm. The best manner of putting them together, is to make the fermentation

strong and quick, is this. When the ferment is solid, it must be broke to pieces, and gently thinned with some of the warm liquor; but a complete or uniform solution of it is not to be expected or desired, as this would weaken its efficacy for the future business. The whole intended quantity being thus loosely mixed in some of the lukewarm liquor, and kept near the fire, or elsewhere, in a tepid state, free from too rude commerce of the external air, more of the insensibly warm liquor ought at proper intervals to be brought in, till thus by degrees the whole quantity is set at work together.

When the whole is thus set at work, and secured in a proper degree of warmth, and kept from a too free intercourse with the external air, it becomes as it were the sole business of nature to finish the operation, and render the liquor fit for the still. In this easy manner the whole end of fermentation would be answered. But during the whole course of the operation, there are several other things that may be added with some particular view, as either to increase the quantity of spirit, or give it some agreeable flavour. These additions may sometimes require some alteration in the general method laid down above, though upon the whole it is right. Shaw's Essay on Distilling.

The force or effect of a ferment arises hence, that, by its more penetrative and moveable parts, it diffuses and breaks the texture or combination of the component parts or principles of the body, gives them a new motion, and disposes them to take a new arrangement, or to combine again in a new manner; and so to constitute a new species of body.

Thus the bite of a mad dog excites a slow fermentation in the blood, whereby the divers liquors, or matters it consists of, lose that nexus, or union, necessary to a state of health; and occasion an irregularity in the spirits, from which arise the horrors, and other symptoms of the disease.

One way of accounting for FERMENTATION, is by supposing a certain ferment in the stomach. But what this ferment is, or whence it should be derived, is greatly disputed.

FERMENTS in the earth. It is very probable, that the natural ferments in the earth may be of more consequence than is generally supposed, and tend to elucidate many things, which at present appear very mysterious. The different fruitfulness of different spots of the same sort of land may be owing to this; as also the different temperature of air at the same time in places very little distant from one another. The effluvia sent up by some of these, not only dissolve snow that falls on them, but even melt it in the air as it approaches, and cause it to fall in rain, not in snow. And often in two places within a mile or two of each other, there shall be a disparity of heat and cold so way off to be accounted for, since there is often no difference of shade or shelter. In Scotland there are large tracts of land, where the ferment is so strong, that the earth sets a person up to the ankles as he walks; and generally, at about a foot depth under this, there is found a stratum of pebbles, so close rammed together, that they seem an artificial casemate. This land, though of no greater depth than a foot, is found very rich for garden plants, and even for fruit-trees. Phil. Trans. N^o 110.

FERMENT, among Physicians, is sometimes used in a synonymous sense with putrefaction, or rather for a putrid habit of body, considered as the cause of malignant disorders.

But these authors are, nevertheless, very careful not to confound putrefaction with vegetable fermentation, accounting them only analogous processes; for which reason, they use the same term for the putrefying and fermenting agent. It were to be wished, to avoid ambiguity, that we had two different words to denote the exciting cause of these two intestine commotions; but this is the less to be expected on account of the tendency of all putrid animal substances to promote both animal putrefaction, and a vinous fermentation in vegetables.

FERMENTARIUM, or FERMENTARIUM, a denomination which those of the Latin church have given to the Greeks, on account of their consecrating and using leavened or fermented bread in the eucharist.

As the Greeks call the Latin *expositus*, the Latins, in return, call them *fermentarii*.

FERMENTATION, an intestine motion, arising spontaneously among the small, insensible particles of a mixed body, and producing a new disposition, and a different combination of those parts.

Fermentation differs from dissolution, as the latter is only a result, or effect of the former; fermentation is frequently without dissolution, i. e. the fermentative motion seldom goes so far as to dissolve the body; but dissolution always supposes an antecedent fermentation.

Fermentation differs from ebullition and effervescence in

this, that the motion, which in the first is slow, in the two latter is violent; and that, in the first, the motion is restrained to the minute particles of the body; but in the latter, it extends to large masses thereof.

Indeed it must be observed, that authors usually allow of divers kinds of fermentation; viz. an insensible one, which is only known from its effects; and a sensible one; a violent and a moderate one; a hot and a cold one; a natural and an artificial one.

Chemists distinguish three particular kinds of fermentation, or three stages of the same fermentation, which refer to the three principal products resulting from it. The first is called the *vinous* or *spirituous*, because it changes into wine the liquors which undergo it, and because from this wine may be obtained an inflammable spirit, miscible with water, called spirit of wine. The second kind of fermentation is called acid, or *acetous*, because the product of it is an acid or *vinegar*. The third kind is called the *putrid* or *putrefactive*, and sometimes the *alkaline fermentation*, in which case the texture of the fermented substance is destroyed, and having lost its original characters of taste, colour, and smell, it becomes fætid, rotten, and offensive; and if committed to distillation, yields neither an inflammable nor an acid spirit, but a sharp pungent liquor, being a solution of volatile alkaline salt, nearly similar to that salt which may be obtained by the force of violent heat, from animal substances, without suffering them first to become putrid. All matters susceptible of the *spirituous fermentation* may afterwards undergo the acid, and, lastly, the *putrid fermentation*; but some substances are not susceptible of the *spirituous fermentation*, but proceed first to the acid, and afterwards to the alkaline or putrid fermentation; and lastly, some substances are susceptible of the putrid fermentation only. From these considerations, and others of a similar nature, Stahl and many other chemists consider these fermentations less, as three operations distinct and independent of each other, than as three principal and distinguished degrees of one and the same fermentative motion, by which nature endeavours to resolve, and to reduce into a similar condition, all the moist compound bodies, into the combination of which the oily principle enters, that is, all animal and vegetable substances. These substances, as long as they make part of the living vegetable or animal, undergo fermentation in a slow and insensible manner, being preserved from it by the vital motion; but when the life of organized bodies ceases, all these substances sensibly acquire the fermentative motion, pass more rapidly and regularly from one stage of it to another, according to the concurrence of circumstances which generally favour fermentation; so that fermentation, in this view of it, appears, upon the whole, to be nothing else than putrefaction. See DIGESTION. Dict. Chemistry, art. FERMENTATION.

Plants bruised, and left a certain time in a close vessel, ferment of themselves; and, if let alone, the fermentation will proceed to putrefaction.

In order to fermentation, it is necessary the ferment have something acid and spirituous in it; that its motion be tumultuous; that it be in an open, spacious place, and assisted by the air; and that it tend to exalt and purify the body, and produce vinous, or inflammable spirits. These are the particular properties and conditions of fermentation; though, in the general, all required to effect a fermentation, in a body, or liquor, which is not homogeneous, that is, which consists of different principles, is, that there be a strong attraction between the particles of the ferment, and the body; that the parts of this latter be moved and agitated irregularly; and that this motion produce some alteration in the mixed.

All vegetable and animal substances, into the composition of which enters a certain quantity of fluid oil and earth, rendered perfectly soluble in water, by the intervention of a saline matter, being diffused in a sufficient quantity of water to become liquid, or at least soft, and being exposed to heat from a few degrees above the freezing point to twenty-five and more, and when the communication with air is not entirely obstructed, suffer spontaneously the fermentative motion, which entirely changes the nature and proportion of their principles; and, therefore, the fermentation of any body may be prevented or suspended by intense cold, want of air and water, and a disproportion of the principles of the body exposed to fermentation.

Fermentation is one of the most obscure processes in all nature. The generality of our later philosophers allow it in great measure a mystery, to which their principles will not fully reach. Dr. Morgan attempts to account for it, on the Newtonian system. His principle is, that the expansive force of air, rarefied by the action of fire, or the mutual action of fire and air, is the universal natural cause of fermentation and dissolution.

To show this, he considers two great powers, or principles, in bodies; viz. an attractive, cohesive power, in the small particles of matter, as the principle of all rest, coherency, &c. and the expansive force of heated air as the principle of fermentation. On the different proportion and adjustment of these two opposite forces, with respect to each other, the constitution, texture, and cohesion of bodies, are said to depend.

By the attractive force, acting alone, the constituent parts of compound bodies must be brought to their nearest and greatest contact, and remain there in a degree of firmness and cohesion, proportional to the quantities of contact.

On the other hand, by the repulsive, expansive force, acting alone, all bodies, even the most compact and solid, must be diffused and dissolved into one perfectly fluid incoherent mass.

If both be found in the same body, and equal in degree, such a body must continue in its present state of fluidity, or cohesion; if the attractive power prevail, the quantity of contact, or degree of cohesion, will be continually increased to a certain pitch, where it will rest. On the contrary, if the expansive force of the fire and air, included in any body, or mass of matter, prevail against the attractive power of the contiguous parts, the parts must necessarily recede from their points of contact.

And this happening through all the subdivisions of which the body or mass is capable, every small part must be divided and separated into other smaller parts; and these again into others, and so on, till we come to the first constituent particles or atoms, which are supposed to be perfectly solid, and indivisible.

This receding of the parts of bodies from their points of contact, and the separation and division consequent thereon, is what we call rarefaction; as, on the contrary the approach of the parts nearer to the points of contact, is called condensation. Now from the contrary effects of these two forces, there necessarily arises an intestine commotion, collision, and natural struggle of the parts among themselves; i. e. the parts acted on by two such opposite forces, will fly off and recoil, recede and accede, in proportion to the strength and energy of the opposite power, till one or the other prevail, either to fix and condense, or to dissolve and diffuse it; which alternate motion is what we call fermentation.

If the attractive force prevail, the moist fluid body will be consolidated, as water into ice.

The circumstances necessary for causing a fermentation between a solid and a fluid, as they are stated by Dr. Friend and Dr. Keil, the reader will find under ATTRACTION, art. XVI. and MENSTRUUM.

Dr. Boerhaave makes the following conditions requisite.

1. That there be a due proportion between the size of the particles of the fluid, and the pores of the body to be dissolved.
2. That the figure of the particles of the fluid have a determinate relation to that of the pores of the solid.
3. That the particles of the fluid be sufficiently solid, so that their moment or force of action be not too weak.
4. That the particles of the fluid, when received into the pores of the solid, be fitly disposed to make some stay there, and not immediately to pass through; but to act every way upon the solid as they move towards the external surface thereof. Chemistry, by Shaw, p. 344.

Mr. Rowling apprehends, that nothing more is necessary, than that the particles of the solid attract those of the fluid with a greater degree of force than either those of the fluid or those of the solid attract one another; and that this single supposition will apply to the solution of a solid by a fluid, and to the fermentation occasioned by the mixture of two fluids. Nat. Phil. part II. diff. 8. But perhaps a more accurate and complete theory of fermentation may be formed by means of the modern discoveries, relating to air. Air is known to be combined with various substances, and to adhere to their constituent particles in a fixed or non-clastic form, according to Dr. Hales and others, the cement or bond of union between them. This principle, which is now generally known by the name of fixed air, is supposed to be the immediate cause of cohesion, since the preservation of firmness and soundness in bodies depends on restraining the escape of this air; for as soon as it flies off, and resumes its elasticity, the other constituent particles, viz. the earthy, saline, oily, or inflammable and aqueous, being hereby put into motion, immediately begin to exert their several peculiar attractive and repulsive powers, and run into new combinations, which first change, and at length altogether destroy the texture of the substance which they formerly composed, provided that this substance contained in itself a sufficient quantity of water to allow of the intestine motion; by giving the proper degree of fluidity or moisture; for without fluidity there

can be no intestine motion, and without intestine motion there can be no change of combination. Whatever, therefore, in these circumstances, occasions a release of this air, and serves to change its flux, from that of a concrete body into an elastic repelling fluid, will produce fermentation. It is well known, that the particles of bodies attract each other within certain distances, and that, when they are placed beyond the sphere of each other's attraction, they begin to exert a repulsive power. Heat may be one cause of expanding bodies, so that their constituent particles may be removed to such distances from each other, that their attraction shall cease, and their mutual repulsion commence. A quick vibration, and violent intestine motion, excited among the minute particles of bodies, will occasion a similar separation of these particles, and a consequent change from a concrete to a repelling state. Thus, when any two united particles are torn asunder by the superior attraction or activity of a medium or solvent, they must at the instant of separation recede from each other with a force equal to that with which their disjunction was resisted. And the effect of the violent separations of the particles of bodies, which occur in chemical decompositions, solutions, and fermentations, will appear very great, when we consider the minuteness of the particles engaged in these operations, and how much the activity or force of the attraction and repulsion of bodies depends on the fineness of their size. See on this subject Macbride's Essay, vol. 2. Chemical Dict. Eng. ed. 2. vol. iii. p. 80, 81. See PRESERVATION.

The business of fermentation is one of the great preparations to the distillery. What we usually call vinous fermentation, in particular, is the kind in which it is principally concerned. By this we usually understand that physical action, or intestine commotion of the parts of a vegetable juice, in clove, or solution, which render them fit to yield an inflammable spirit on distillation.

This fermentation in the hands of the distiller differs from the common one, that is used in the making of potable vinous liquors, as being much more violent, tumultuary, active, and combinatory than that. A large quantity of yeast, or other ferment, is added to the distiller's fermentation; the free air is admitted, and every thing is contrived to quicken the operation, so that it is sometimes finished in two or three days. This great dispatch, however necessary to the large dealer, has its inconveniences attending it; for the spirit is by this means always fouler, more gross, and really terrible, than it would have been if the liquor had undergone a proper fermentation in a slower manner. It also suffers a diminution in its quantity, from the violent and tumultuary admission, condensation, and agitation of the free air, both in the body and upon the surface of the liquor, especially if the liquor be not immediately committed to the still as soon as the fermentation is fairly lacked or fully ended. It is a very difficult task to render the business of fermentation at once perfect and advantageous. To ferment in perfection, necessarily requires length of time, and careful attendance, and close vessels, beside several other articles of nice management, which cannot be expected to be received and practised in the large way, on account of the trouble and expence, which it could be proved to the distiller, as possibly in some time may, that the quantity of spirit would be so much greater from the same common way, that it will more than pay its own expence; to which may be added, the very well known advantage of the spirit thus procured by perfect fermentation, being much finer than that obtained in the common way: till this shall be made out, it may not be amiss to try how much of the more perfect art of vinous fermentation, is profitably practicable by the distiller in the present circumstances of things. The improvements to be made in this art will principally regard, 1. The preparation or previous disposition of the fermentable liquor. 2. The additions tending to the general, or some particular end. 3. The admission or exclusion of the air. 4. The regulation of the external heat or cold; and, 5. A suitable degree of rest at last. When proper regard is had to these particulars, the liquor will have its due course of fermentation, and it will thence become fit to yield a pure and copious inflammable spirit by distillation. The tincture, solution, or liquor, intended for fermentation, for the still, should be considerably thin and aqueous. That sort of richness there is in the twelve billing small beer, is the utmost that ought to be allowed to it. This property not only fits it to ferment readily, but also to yield a larger quantity, in proportion, of a pure vinous spirit, than it would do if it were more rich or clammy: the gross, foul, viscid, and earthy particles of such glutinous liquors being, after fermentation, apt to rise up with the boiling heat which must necessarily be employed to

raise the spirit; and the spirit thus of course comes over foul and fetid. There is also another advantage attending the thinness of this liquor, which is, that it will sooner become fine by standing before fermentation; whence it may be commodiously drawn off from its faces or bottom, which must always in case of corn, malt, or any other mealy substance, be kept out where the purity of the spirit is consulted. A certain degree of warmth seems necessary in all the northern climates, to all sorts of artificial liquors, intended for immediate fermentation, especially in winter; but the natural juices of vegetables, which have never been insipidated, as that of grapes, and other fruits, when fully ripened, will usually ferment, as soon as they are expressed, without any external assistance. But as a certain degree of insipidation prevents all tendency to fermentation in all vegetable juices, though otherwise strongly disposed to ferment: to a long continuance, or an increase of the insipidating heat, especially if it acts immediately through a metallic or solid body upon the juice, will destroy its fermenting property; and it will do this the more effectually, as the heat employed approaches to that of scorching, or the degree capable of giving an empyreuma. After the same manner, several experiments make it appear that there is a certain degree of heat, the continuance, or least increase of which, proves detrimental or destructive to fermentation; as there is another, which in a wonderful manner encourages and promotes it. These two degrees of heat ought to be carefully noted and felt by the thermometer, or other certain methods, for philosophical and chemical uses; but for common, or all economical occasions, they may be limited to what we call a tepid and fervid heat: a fervid heat is the base of all vinous fermentation; as a tepid one, or rather an imperceptible warmth, is the great promoter of them. In this neutral state, therefore, with proper contrivances to preserve and continue it, the liquor is to be put into a suitable vessel for fermentation; at which time if it works not of itself, it must be quickened by additions; and, in general, by such things as are commonly called FERMENTS. See SPIRITS, MAKING UP, LOWERING, &c.

The juices of plants are likewise altered by fermentation, and are susceptible of many, and those very various, changes from it. And it is not only the juices of fruits that are thus to be wrought upon, as those of apples, pears, grapes, and the like, in the common way; but there is an artificial change to be made in the seeds of plants by what is called malting. And it is not grain alone that is thus to be wrought upon, but any other feed whatever may be made to yield its juices and virtues freely to water by this process. The juices of roots also, for instance that of liquorice, will be wrought upon in the same manner; and the juices of the bodies of trees, as of the birch, and the like. If in the month of March a hole be bored into the body of a birch-tree, and this hole be stopped with a cork, through the middle of which there is thrust a quill open at both ends, the juices of the tree will drop out at the quill at the rate of a large drop every second of a minute, and a great quantity will in time be obtained in this manner. This liquor is not unpleasant to the taste, and looks tolerably clear, resembling water into which a little milk had been spilt. There are many ways of fermenting this juice, by all of which it is converted into a sort of wine. These are well known; but there is another remarkable property in our maples, both the common small kind, and the great one, which we call the yewmores, these being tapped in the same manner, will bleed freely in winter; and their juices, after a hard frost breaks, will flow out in so copious a manner, as is scarce to be conceived. The willow, the poplar, and the walnut-tree, will all bleed also; and fermentation, of which their several juices are easily susceptible, will turn them all into palatable and strong wines. See BREWING.

To obtain an idea of these changes, we cannot consider it better, than in the procuring of a spirituous liquor from malt, by means thereof.

It is to be observed then, that the malt being made, as shewn under the article MALT, and then laid to infuse or mash in hot water, the rest of the process of brewing is nothing but a raising and directing of a fermentation, or intestine motion.

How such motion is mechanically affected, and how it brings forth such a spirit, may be conceived from what follows; supposing the reader acquainted with these common propositions in hydraulics; viz.

1. That a body immersed in any fluid, specifically lighter than itself, will sink; otherwise it will emerge, and get to the top.
2. That if two equal bodies of different specific gravities be immersed in a fluid, lighter than either of them, the celerities of their descents will be as their gravities.

3. That if two unequal bodies of unequal specific gravities be immersed in a fluid, lighter than either, the velocities of their descents will be compounded of their gravities and dimensions together.

The same laws by which bodies descend, hold good in the ascent of those specifically lighter than the fluid.

Hence, in all heterogeneous fluids, the constituent parts of which are not fitted to associate and cohere, to set forth what is called an uniform homogeneous fluid, the heavier may be accounted as solid bodies immersed in a fluid specifically lighter; and the lighter parts, as such bodies in a fluid specifically heavier; since it may be demonstrated, that the component parts of all fluids, separately considered, are solid.

The liquor, therefore, called *must*, which is a decoction of malt, may be considered as such an heterogeneous fluid, whose parts cannot be interchanged in their positions, till each has obtained such an elevation as corresponds to its proper gravity; but left this alone should fail of the intention, by not being sufficient to break those molecule and viscidities, which entangle the spirituous parts, and likewise to prevent their flying off at the surface, some portion of an already fermented substance is mixed with it.

In the fermenting of malt for distilling the spirit, the meal of unmalted corn is found necessary to be mixed with the malt, to prevent its excessive fermentation, and throwing off the matter of the spirit; but as distillation is required in this case, a good quantity of yeast is added to quicken the fermentation, so that it may be finished in two or three days. More yeast is to be added if the weather be cold, and less if it be hot: the reverse of this is to be understood of meal, more of which is to be added in hot weather to check, and less in cold to hasten the operation, which in the present case is designed to be violent, contrary to what ought to be observed in the fermentation of wines, where the slower the operation is performed, the better the liquor will prove, and this may indeed here hold also in a less degree; for it is possible to ferment the wash so violently, that it shall soon end in putrefaction. Shaw's Lectures, p. 216.

This substance, termed *brun*, or *yeast*, consists of a great quantity of subtle spirituous particles, wrapped up in such as are viscid. Now, when this is mixed with such a liquor it cannot but much contribute to that intestine motion which is occasioned by the intercourse, and occurrences of particles of different gravities; as the spirituous particles will be continually striving to get up to the surface, and the viscid ones continually retarding such an ascent, and preventing their escape.

So that by these two concurring causes the particles extracted from the grain will by such frequent occurrences be fo comminuted, as continually to increase the more subtle and spirituous parts, until all that can be made fo by attrition, be set loose from their former viscid confinements; and this appears by the warmth of the liquor, and the froth driven to the top; just at which time, if it be thrown into the still, it affords some quantity of a highly inflammable spirit.

Moderate warmth much hastens this process, as it assists in opening the viscidities, in which some of the spirituous parts may be entangled, and unbinds the spring of the included air, which cannot but contribute to the rarefaction and comminution of the whole.

The viscid parts, which are raised to the top, not only on account of their own lightness, but by the continual efforts and occurrences of the spirit to get up, both these when the ferment is at its height, and prevent the finer spirits making their escape; for if this intestine locus be permitted to continue too long, a great deal will get away, and the remaining liquor will grow flat and rapid, and raise little bubble in the still.

A quantity of fixed air is extricated in the process of fermentation, recovers its elasticity, and being rarer and lighter than the fermenting liquor, rises to the top, occasioning an intestine commotion, and bearing with it some of the more volatile and spirituous parts of the liquor, but being heavier than the atmospheric air, rests on the surface. See WOOD.

Some of the processes in chemistry seem to prove, that fermentation is not confined to animal and vegetable substances, but that minerals are also liable to it in some degree. If an ounce of lead and an ounce of bismuth be melted together in an iron ladle, and an ounce of quicksilver be heated in another ladle, and all three mixed together, this makes an amalgamation, which appears perfectly homogeneous, and passes through leather in a running form, without leaving any thing behind. But this mixture being suffered to stand quiet for some hours, a gross matter will separate from it by degrees, and float upon the rest, which will now run easily through leather, and leave the gross matter behind. Here appear all the requisites of fermentation. 1. A fluid form. 2. An uni-

form matter. 3. An intestine motion. And, 4. An actual separation of a grosser matter leaving a thinner behind. Shaw's Lectures, p. 139.

Fermentation is a point of the utmost consequence in medicine, and the animal economy; it is one of the principal means or instruments we have for altering, exalting, or calling forth the properties and powers of bodies. See DICAS 1198.

The greatest use of the theory of fermentation in medicine, will be in teaching what parts of the materia medica are most properly brought under this procedure; and how such intestine motion does, in some things, destroy their virtues; for by some medicines an incision is aimed at which is not to be procured, but by their being spirituous, whereas, in others, the very contrary property is required; in such cases, therefore, when by any adventitious cause those medicines get into a ferment, they are destroyed, and should not be administered.

FERMENTED LIQUOR. All fermented liquors abound with a superabundant proportion of water; and if a very considerable quantity of it were taken away, they would become not only richer, but more durable, provided that so much of the aqueous humidity was retained, as was just sufficient to preserve the viscous confluence, to keep the saline part fluid, and to retain the slimy and unctuous parts expanded and mixed among the rest. But as an actual and truly saline matter abounds in WINE and VINUM, and that of an acid, austere, and tartareous kind, when the spirituous part is drawn away, the wine becomes surprisingly more austere; and when a large quantity of the watery part is separated, this superabundant saline, tartareous matter, coagulates into a crystalline form, and either falls to the bottom, or sticks to the sides of the cask. For the subtle, oily matters, which makes the spirituous part in wine, blunts and takes off from a tartareous acidity, in the same manner that the addition of spirit of wine blunts, and dulcifies the acid, corrosive parts of spirit of nitre in making the spiritus auri dulcis. But this tartareous salt abounding also with an undue proportion of fo gross and unctuous matter, cannot be dissolved or diluted without a very large proportion of water, which being taken away, it is precisely converted into dry and solid crystals, as is the known case of cream of tartar. Hence it proceeds, that the austerity and roughness of wine are the more perfected, the more the wine is deprived of its spirituous parts. This experiment is familiar in our kitchens, where wine being burnt or boiled into sauce, is found to have a much greater degree of austerity, than the sauce and wine had before it had undergone the action of the fire, and lost its spirituous part. When the water is even by distillation plentifully drawn off from wine, not of a tartareous and chalky, but of a tartareous nature, a beautiful tartar will be found to crystallize, among the remaining mass, in a considerable proportion. But though this superfluous water that generally dilutes the wine, and weakens its taste, might be advantageously spared from it, and it would then become much more rich and noble, and at the same time more smooth and soft, through the loss of some considerable portion of its tartar; yet this separation cannot be effected by distillation, because that carries away other parts as well as the water, and damages the whole, by taking off what ought to be the most carefully preserved. The spirituous part is the life of all fermented liquors, it keeps the whole together, and in a manner embalm and renders them durable and not subject to corruption; it also in a great measure gives them that aromatic refreshing and restorative virtue, and the best effects they have on the human body. Not is this all, but the intimate and subtle union of this spirituous part with the rest, is perfectly the sole and entire cause of both the former effects, so that it by no means suffices to have the spirit barely present among the other parts, for then it might be drawn off and poured back again, without any damage to the wines; but the essential union is here dissolved by taking it away, and can never be restored again by a simple re-addition. It is therefore destructive of the end proposed, thus to break and dissolve the texture of the wine, and this entirely subverts and destroys its nature. This inevitably proves the case, whenever wine is evaporated or distilled, which constantly requires a degree of heat capable of raising water into vapour, and hence the spirituous part being much lighter than the aqueous, flies off together with it, or before it, and the wine is left dissolved in its texture, and without its soul. Upon this, the remaining saline unctuous mass is so disturbed, as no longer to remain connected, but it becomes thick and torpid, and afterwards runs impetuously into a kind of corruption, attended with acidity and rancidity. All these circumstances shew, that though the condensing of wines, by taking away their superfluous humidity, would be a very desirable thing, yet it is by no means to be done by evaporation.

Fermented liquors are esteemed great antidotes to *PUTRIFICATION*; accordingly the abstinence from them is assigned as one cause why the Turks are more subject than other people to the plague, and other contagious distempers. It is likewise observed, that beer, wine, and spirituous liquors, coming more into general use, has been one great means of suppressing putrid diseases. See *Pringle's Observ.* on the Diseases of the Army, p. 284, 285, and Macbride's *Ed. ed.* 3. See *ANTISEPTIC*, *CHOLERA*, and *SERVICE-BERR*, and *WATER*.

FERN, *Fern*, in *Botany*, the name of an order of plants belonging to the *cryptogama* class; and comprehending sixteen genera; among which are the horse-hair, maiden hair, adder's tongue, spleenwort, polypody, &c. to the last of which belong the common male and female fern, besides a great number of other species. The leaves are composed of other leaves, affixed on each side the middle rib, and these are subdivided, almost to their ribs, into other pinnules, or little leaves. The flowers have not been discovered, and the seeds grow in clusters on the under part of the leaves. To this it is to be added, that there is also a peculiar face in the ferns, which distinguishes them at full sight from the other plants of this kind.

The seeds of the several species of fern were wholly unknown to the ancients. Swammerdam, in his *Biblia Naturæ*, claims to himself the honour of having first discovered them; but it appears from Hook's works, that Dr. William Cole first gave an account of the seeds of several of the plants of this kind to that author, in 1669, whereas Swammerdam declares his discovery of them to have been in 1673; so that it is plain that Dr. Cole was prior to him by some years. The seed-vessels of the common fern, the English and foreign maiden-hairs, the wall-rue, harts-tongue, and the like plants, are all similar in their general form, their only differences being in the size, and in their arrangement on the plants. The number or quantity of the seeds is very different in different plants, but Mr. Miles observes, that the fewer seeds there are in any species, there is always the more in quantity of a sort of spungy or fungous matter, which forms a kind of tubercle, not unaptly resembling what is called *scum*, which seems a substance intended for the sheltering of the seeds.

In the female fern and English maiden-hair, the whole surface of the leaf on the under side seems covered with 5 congeries of seeds, so that they guard one another, and therefore have little occasion for a covering of fungous matter of this kind; yet even on these plants, when the seeds are fallen off, there are found small membranes, a little curled, looking as if they had been raised with the edge of a fine pen-knife from the skin of the leaf, not unlike the pieces of skin that are raised off from the hand, in trying a pen-knife, or other sharp instrument. In the common male fern there are found, as the proper season, several brown spots placed in a regular manner; these are of a pale brown colour, and are principally composed of this fungous matter, the seed-vessels being small and inserted round it. *Phil. Trans. N° 461. p. 774.*

The seed-vessels consist of a stalk, by which they are inserted into the leaf; this represents an elastic cord, and is surrounded by a great number of annular ribs, resembling the carriages of the aspera arteria; and indeed nothing in nature so exactly resembles this cord or stalk, as the wind-pipe of a small bird. This cord encircles the globular membranous pod wherein the seed lies, adhering to it, and dividing it into two hemispheres. See *Tab. of Microscopical Objects, Clus. 2.*

The pod is composed of a fine whitish membrane, somewhat like that which lines the inside of a pra-shell; the seeds are irregular in shape, and of a reticulated surface. The most advantageous way of viewing this is to use the common microscope for opaque objects, putting on a small magnifier, and laying the seeds with their capsules, &c. as taken from the back of the plant, on a piece of polished ivory. The proper time of the year is in the beginning of September, and then if the plant be newly gathered, the seed-vessels often burst while they are under inspection, which is the method nature has taken for dispersing the seed, and shew a very elegant appearance. *Phil. Trans. N° 461. p. 782.*

The common female fern is a very mischievous and troublesome weed to the farmers, being very difficult to destroy, where it has any depth of ground to root in. Its roots will often penetrate to eight feet deep, and spreading a great way, they will rise again to the surface, and send up new plants at a considerable distance. In grass land the best way of destroying them, is mowing the grass three times a year, in spring, in May, and in August. Daisies and other very good pasture for lands which abound with them; but the best of all things for destroying

them, is urine. Fern cut up when the sap is in it, and laid to rot upon the ground, is a very good manure for land, and will mellow it so as to prevent its binding. Trees planted where fern grows, are observed to thrive very much, even though it be upon a hot gravelly soil, the reason of this is, that the fern shades the roots, and keeps them moist and cool. Mortimer's Husbandry, p. 216. Scotch sheep put into land where there is much fern growing among the grass, generally destroy it in a little time, partly by their dung and urine, and partly by treading it down.

The root of the male fern is greatly recommended by medical writers, as a cure for rickets in children. Some also give it in powder, against worms; and it has the same virtues against the stone and gravel, with the rest of the genus of capillary plants, ascribed to it. It was frequently prescribed by the ancients in diet drinks, for removing obstructions, and in chronic cases of all kinds, but is much disused at present. *Lemery, Dict. des Diag.*

All the species of fern, and other vegetables, which carry their seeds on the back of their leaves, as moon-wort, and the like plants, possess the same general virtues of drying and strengthening the viscera, especially the spleen.

FERRETER. The poor people in many parts of the north of England, use ashes of fern instead of soap, for washing their cloaths; they cut the plant green, and then burn it to ashes, and make them up into balls with water; they dry these in the sun, and keep them ready for use.

The ashes of the common female fern produce a very singular phenomenon in the common way of treating them and their salt. If a large quantity of these ashes be procured, and the salt to the quantity of several pounds extracted from them in the common way, it will succeed better than in smaller quantities. The greater part of this salt being dried, if the remainder, which is more moist, be exposed to the air to receive some of the vapours of it, this will soon become fluid, or an oil, as it is more improperly called, per deliquium. The rest of the lixivium, which will be very heavy, and of a deep blood-red, or claret-colour, being set by in a glass-vessel unstoppered for five or six months, there will be found at the bottom of the liquor a very large quantity of salt precipitated to the thickness of about two inches on the bottom of the vessel. The lower part of this will have all the foulness, and appear discoloured; but the upper part will be extremely pure and white. From the surface of this part there will grow up a number of plants, in appearance standing erect, and at small distances from one another. These are only the last crystallizations of the subliming or separating salt, which they have a regularity that is very surprising; they vary considerably in size and weight, but are all of the same shape, exactly resembling to many plants of the common unbranched fern, sending out a great number of regular leaves on each side the stem. These ramifications of the salt will remain many weeks in this perfection, if the vessel be not stirred; but they are so tender, that the least motion destroys them, and they after this never form themselves again. *Phil. Trans. N° 105.*

FERRETER, in *Pottery*, a name given by our merchants who have been in China, to a sort of varnish, which the Chinese use in their porcelain manufactories. It is also called lime-oil, and is a thing so easily made, that it would be worth attempting what might be done with it, in our imitations of the porcelain. They make it in this manner: they take a large quantity of fern well dried, and spreading a covering of it over a piece of ground sufficient for the quantity of oil they intend to make, they lay upon this a coat of large lime-stones, newly calcined into limes, on these they sprinkle with the hand a small quantity of water just to make them. They cover this bed of lime with another of fern, and so on, till they have raised it to eight or ten feet high; they then set fire to the fern, this burns away in a little time, and leaves a mixture of the lime and its own ashes. This mixture is laid in the same manner between beds of more fern, and burnt again. This operation is repeated five or six times. *Observ. sur les Coutumes de l'Asie.*
